**MANUAL HOLDER'S RESPONSIBILITIES**

The registered holder of this manual is responsible for ensuring:-

That all revisions are correctly incorporated without delay.

That this manual is readily available to the holder's staff and that revisions are brought to their attention.

That any suspected error or omission is reported to Technical Publications.

That Technical Publications is advised of any change in the holder's title and/or address.

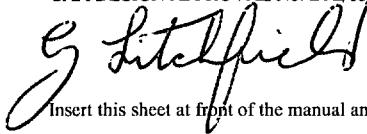

That loss of this manual is reported to Technical Publications.

That when the holder's duties no longer require him to hold this manual that it is returned to Technical Publications.

  
CHIEF ENGINEER

To be inserted in front of the manual frontispiece.

THIS TRANSMITTAL IS ISSUED BY BRITISH AIRWAYS ENGINEERING (TECHNICAL INFORMATION SERVICES, G2, TBA, S401, P. O. BOX 10, HEATHROW AIRPORT, HOUNSLOW, MIDDLESEX TW6 2JA) AND TEMPORARY REVISIONS CONTAINED IN THE MANUAL, AS LISTED BELOW, COMPLY WITH BCAR'S CHAPTER A5-3, B5-3 AND/OR TSS No. 0-2 AS REQUIRED.  
CAA DESIGN APPROVAL No. DA1/8566/78.

For TECHNICAL &amp; QUALITY DIRECTOR

Insert this sheet at front of the manual and destroy previous issue. Complete Revision Record Sheet after revision incorporation.

TR Page 1 of 3

OLYMPUS 593

12 September, 2001

OVERHAUL MANUAL

ATP: E6868

TEMPORARY REVISION No. 78-537

THIS TEMPORARY REVISION IS ISSUED BY BRITISH AIRWAYS ENGINEERING (TECHNICAL INFORMATION SERVICES, G2, TBA, S401, P. O. BOX 10, HEATHROW AIRPORT, HOUNSLOW, MIDDLESEX TW6 2JA).  
CAA DESIGN APPROVAL No. DAI/8566/78.

Manual Reference 78-13-01 Page 568

**REASON FOR REVISION**

EOC-COM-78G076 - Telescopic tube fail safe ring.

**ACTION**

Paragraph 22. Installation of Bucket Drive Pneumatic Actuators  
(Figure 513).

NOTE: EOC-COM-78G076 (Rolls-Royce/SNECMA SB OL.593-78-28235-47).

Telescopic tubes (Figure 513, Item 17-10) are used to provide a dynamic link between fixed and variable air ducts in the Concorde thrust reverser system. Several cases of incorrect installation of the telescopic tube have been identified during the service life of the aircraft. EOC-COM-78G076 introduces a spring ring which fits in the groove at one end of the tube, preventing incorrect installation (See TR Figures 1 and 2).

Originator: A.Cope

## HIGHLIGHTS FOR REVISION NO.107

### Chapter/Topic

#### 71 - Power Plant

71-00-01 Assembly Stage 2	Bolt lubricant and torque figures amended in accordance with SB.0L.593-72-9044-436.
71-00-01 Assembly Stage 3	Bolt lubricant and torque figures amended in accordance with SB.0L.593-72-9044-436.
71-00-01 Assembly Stage 4	Bolt lubricant and torque figures amended in accordance with SB.0L.593-72-9044-436.
71-00-01 Assembly Stage 5	Bolt lubricant and torque figures amended in accordance with SB.0L.593-72-9044-436.
71-00-01 Assembly Stage 6	Bolt lubricant and torque figures amended in accordance with SB.0L.593-72-9044-436.
71-00-03 Engine Despatch	Bolt lubricant and torque figures amended in accordance with SB.0L.593-72-9044-436.
71-09-00	Rocol 251T added to list of approved materials.

#### 72 - Cleaning

72-09-00	References to Trichloroethane and associated NOTE deleted.
----------	---

#### 72 - Inspection/ Check

72-09-03	Examination of Stage 1 LP Comp. Rotor Blades and Stator Vanes amended.
72-31-04	LPC Drive Shaft - Sleeve inspection limits removed and replaced with NOTE.
72-52-02	Temporary Revisions 72-306 and 72-307 incorporated.

## HIGHLIGHTS OF REVISION 107 (CONTINUED)

### 72 - Repair

72-09-31	Inspection port location diagram amended.
72-31-03 Repair No.9	Amended to add new part number and revise grinding dimension.
72-41-01 Repair No.8	Amended to revise lubricant reference for vaporiser threads.

### 72 - Assembly/ Sub-Assembly

72-00-00	Bolt lubricant and torque figures amended in accordance with SB.0L.593-72-9044-436. Amendment to procedure when assembling locking tube to LP Drive Shaft.
72-00-51	Bolt lubricant and torque figures amended in accordance with SB.0L.593-72-9044-436. Illustration 527A added - CC0C Blanking Cover Details (SB.72-8605-276).
72-09-00	Rocol 251T added to list of approval materials.
72-32-00	Bolt lubricant and torque figures amended in accordance with SB.0L.593-72-9044-436.
72-33-00	Bolt lubricant and torque figures amended in accordance with SB.0L.593-72-9044-436.
72-33-01	Bolt lubricant and torque figures amended in accordance with SB.0L.593-72-9044-436.
72-51-03	Bolt lubricant and torque figures amended in accordance with SB.0L.593-72-9044-436.
72-52-01	Bolt lubricant and torque figures amended in accordance with SB.0L.593-72-9044-436.
72-52-02	Bolt lubricant and torque figures amended in accordance with SB.0L.593-72-9044-436.
72-52-03	Bolt lubricant and torque figures amended in accordance with SB.0L.593-72-9044-436.
72-53-00	Bolt lubricant and torque figures amended in accordance with SB.0L.593-72-9044-436.

## HIGHLIGHTS OF REVISION 107 (CONTINUED)

### 72 - Testing

72-00-25                      Tool identification number added for Fuel Pressure (Transducer) Adaptor Assembly.

### 72 - Special Tools

72-09-03                      Engine Internal Examination photographic equipment removed from this section.

72-09-04                      New section created for Engine Internal Examination photographic equipment

### 73 - Fuel and Control

73-12-05                      Temporary Revision 73-001 incorporated.  
Temporary Revision 73-002 incorporated.

### 76 - Controls

76-13-03                      Bolt lubricant and torque figures amended in accordance with SB.0L.593-72-9044-436.

76-21-01                      Bolt lubricant and torque figures amended in accordance with SB.0L.593-72-9044-436.

### 79 - Oil

79-10-00                      Temporary Revision 79-002 incorporated.

## INTRODUCTION

### 1. General

This manual has been produced to provide overhaul/repair information of the Olympus 593 Mk.610-14-28 engine installed in the Concorde aircraft. Book 1 which is considered here, covers the basic engine and external dressings required to build the engine to a testable standard, and includes coverage of power plant testing. Book 2 covers the engine exhaust system.

### 2. Manual Format

The manual has been produced to the breakdown called for in ATA Specification 100 which provides a three element (six digit) identifying system which sub-divides the book into Chapters, Sections and where necessary, sub-divides the Sections into Subjects in the following manner.

- A. The Chapters are denoted by divider cards and provide the first pair of numbers 71, 72, 73 etc. The chapters deal with the Power Plant (the engine plus its dressings), the bare engine and all its sub-assemblies/modules, the fuel, air and oil systems/components, and the ignition, engine controls and indicating.
- B. Each chapter is in turn sub-divided into Sections which are denoted by the second pair of identifying numbers and which deal with a sub-assembly/module or part of a system.
- C. The sections may be sub-divided into Subjects which are a part of a sub-assembly or a component, and are denoted by the third pair of identifying numbers.
- D. Thus for example, the LP compressor drive shaft is identified by 72-31-04. The 72 number denotes it is contained in the engine, the 31 denotes it is part of the LP compressor section and the 04 shows it is a separate sub-assembly of the LP compressor section.

# OLYMPUS 593

MK.610-14-28  
OVERHAUL

- E. Each page is identified by the full element identification number and, in addition, is identified by a page block number which denotes with what aspect of overhaul it is concerned. A full list of page blocks and the topics they deal with is as follows:

Description and Operation	Page block	1- 100
Disassembly	Page block	101- 200
Cleaning	Page block	201- 300
Inspection/Check	Page block	301- 400
Repair	Page block	401- 500
Assembly or Sub-assembly	Page block	501- 600
Fits and Clearances	Page block	601- 700
Testing	Page block	701- 800
Storage Instruction	Page block	901-1000
Special Tools, Fixtures and Equipment	Page block	1001-1100
Light Overhaul	Page block	1301-1400

- F. Chapter 72-Engine contains page block divider cards, and all the subjects for each aspect of overhaul are contained under their divider cards e.g. the disassembly of all subjects (page block 101-200) is contained under the Disassembly (blue) divider card. The remaining Chapters 71, 73, etc. have no page block divider cards and all subjects are in ATA sequence.

### 3. Item Identification

- A. The identifying system of ATA numbering in Book 1 is (where possible) identical to that in the Illustrated Parts Catalogue (IPC), and with the exception of disassembly, references are contained throughout the text as thought necessary, of the IPC Fig. and Item No. for identifying items. The identifying system used in the IPC cannot always be used in the disassembly/assembly page blocks due to the structure of the engine, which in some instances entails the combination of a number of subjects. An example is the RH Gearbox Assembly which is called out under seven subjects 72-63-00 to 72-63-06 in the IPC, but is disassembled/assembled as an assembly under 72-63-00. Where this occurs, a token page is contained in this book which refers to the Section/Subject number under which the information is contained.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- B. A similar arrangement has been used in the Inspection/Check page block where because of inter-relating items or duplication of checks, a number of subjects in the IPC have been contained under one subject number in this book. In Chapter 72 Engine, token pages have been included which refer to the subject number under which the information is contained. The remaining Chapters 71, 73, 74 etc. do not generally contain token pages, but the Chapter Contents pages of each Chapter denote the subjects contained under each Section/Subject number.

#### 4. Cleaning and Inspection/Check

- A. For identification of items during cleaning and inspection/check topics, the IPC illustrations have been reproduced, with the difference that all consumable (low cost items) have been deleted, and items that normally remain assembled, such as studs, inserts etc. have been shown assembled with the IPC references indicating their position.

#### 5. Service Bulletins

- A. All Service Bulletins quoted in this manual are identified by their chapter No. and issue sequence No. only. The engine identification code OL.593 has been omitted for simplicity.
- B. With the exception of Mandatory bulletins which are basic in the text, all other service bulletins (SB) that entail a different disassembly or assembly procedure, cleaning process or inspection/check etc. are identified in the text as post or pre SB standard. Where a SB entails a direct replacement of an item that does not affect a procedure etc. the SB is not identified in the text.

#### 6. Standard Practices

- A. To prevent duplication of information of a general nature in each subject, standard practices of each topic of overhaul are contained under section 72-09-00 of each topic, or under 71-09-00 for Power Plant information on disassembly and assembly.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

## 7. Repair

- A. Information of a general nature dealing with repair are contained in Standard Practices 72-09-00 Repair, while procedures for finishes (painting, plating etc.) are detailed under their own subject number 72-09-01, 02 etc. Additional information of a general nature dealing with where to apply paint, plating etc. and how to dress out damage within the Inspection/Check acceptable limits on an item, are contained under their own Chapter/Section/Subject number.
- B. Information of a specific nature dealing with one aspect of an item or items will be contained in a Repair, and each repair will be identified by a No. and will start on page 401. The Repairs will follow any information of a general nature in each Chapter/Section/Subject as applicable.

OVERHAUL

### OBSERVANCE OF MANUAL INSTRUCTIONS

The instructions for overhaul and repair of the engine contained in this manual, particularly those related to cleaning, inspection, surface protection and repair of major rotating parts and of other "high duty" parts, have been devised to preserve the integrity of the parts during their service lives.

Instructions are written to permit, wherever possible, the use of routine workshop practices in the performance of tasks and to give flexibility where appropriate. However, where instructions are specific as to means and method, it is important that alternatives are not used unless agreed with Rolls-Royce/SNECMA, since even minor deviations from the specified parameters may require careful evaluation in order to avoid abuse, e.g. machining abuse, which may not be detectable by routine inspection.

Where changes to the specified instructions are agreed, Rolls-Royce/SNECMA will consider revising the manual to include the change as an alternative.

OLYMPUS 593

MK.610-14-28

OVERHAUL

## ASSEMBLY OF PARTS

Owing to the physical similarity of components with different part numbers, it is possible to assemble engine parts into the wrong location, and into engine types for which they were not intended. Such incorrect assembly could possibly result in failure. Before fitting components therefore, always check the part number to ensure that it is the correct item.

## CONTAMINATION OF ENGINE COMPONENTS

### 1. General

Contamination of a material by a low melting point alloy can, at certain temperatures, lead to intercrystalline penetration and subsequent embrittlement and cracking.

Contamination by chloride based materials of stainless steel tubes can, after a period of time, cause stress cracking and ultimate failure.

### 2. Contamination by Cadmium Plated Tools

It is possible for deposits of cadmium to be transferred from a plated tool to the surface of an engine component. In the case of titanium components this could result in rapid failure of the component under certain running conditions.

The failure is caused by the cadmium reacting, at certain temperatures, with the titanium, resulting in embrittlement and cracking.

In view of this, any tool or item of equipment which is liable to come into contact with titanium must not be cadmium plated.

### 3. Chafe Wrapping of Stainless Steel Tubes

Chloride based materials (e.g. neoprene tubing and glass fibre tape) must not be wrapped on engine air, oil and fuel tubes to prevent chafing. These materials can breakdown under high engine temperatures, resulting in the formation of salts which are highly corrosive to the stainless steel tubes. After a period of time, stress cracking can develop, resulting in failure of the tubes.

All tubes must be installed with the authorised brackets, clips and bushes only, as specified in the Illustrated Parts Catalogue TP.184/BED.

## ENGINE - ASSEMBLY

### TABLE OF CONTENTS

Para.		Page
1.	General ... ..	501
2.	Assemble Air Inlet Section to Building Base ... ..	503
	A. Prepare Building Base ... ..	503
	B. Assemble the Air Inlet Section... ..	503
3.	Assemble the LP Compressor Assembly to the Air Inlet Section ... ..	503
	A. Prepare the LP Compressor Assembly ... ..	503
	B. Assemble the LP Compressor Assembly ... ..	505
	C. Remove the LP Compressor Rear Bearing Adapter ... ..	507
	D. Remove the Balancing LP Bearing Assembly ... ..	509
4.	Assemble the Adjusting Washer, LP Thrust Bearing Assembly, Bevel Gear and Probe Operating Ring ... ..	511
	A. Prepare LP Bearing Assembly ... ..	511
	B. Assemble the Adjusting Washer, Bevel Gear and Retaining Nut ... ..	513
	C. Assemble the LP Probe Operating Ring... ..	514
5.	Assemble the Brackets to the LP Compressor Case Front Flange ... ..	515
	A. Prepare the Brackets and Bolts... ..	515
	B. Assemble the Brackets ... ..	515
6.	Assemble the Module Plate Mounting Brackets and Identification Plate to the Mounting Brackets ... ..	517
	A. Assemble the Mounting Brackets... ..	517
	B. Assemble the Module Identification Plates ... ..	518
7.	Assemble the HP Compressor/Intermediate Assembly to the LP Compressor Assembly... ..	521
	A. Prepare for Dimensional Check ... ..	521
	B. Assemble the Metaflex Seal ... ..	522A
	C. Remove the HP Compressor/Intermediate Assembly from the Mobile Stand... ..	522A
	D. Determine Thickness of LP Bearing Failure Probe Adjusting Washers ... ..	522B
	E. Lower the HP Compressor/Intermediate Assembly onto the Spacers... ..	523
	F. Lock the Spherical Mounting ... ..	527
	G. Secure the Inner and Outer LP Bearing Housing Baffles to the Intermediate Case ... ..	527
	H. Re-check the Set Dimension ... ..	528
	J. Change the LP Compressor Thrust Bearing Adjusting Washer if Required ... ..	529

Para.		Page
8.	Air Flow and Pressure Check of the LP and HP Compressor Thrust Bearing Failure Warning Probe Circuit ... ..	529
	A. Prepare Test Equipment ... ..	531
	B. Carry Out Air Flow Check... ..	531
9.	Assemble the Exit Guide Vane Cases and Flange Brackets. ... ..	531
	A. Assemble the Cases... ..	531
	B. Assemble Brackets to the LP Compressor Case/ Exit Guide Vane Case Flanges... ..	534
	C. Assemble Brackets to the Exit Guide Vane/ Intermediate Case Flanges ... ..	536
	D. Torque-tighten the Axial Bolts and Flange Bolts ... ..	536
10.	Check HP Compressor Adjusting Washer Setting ... ..	536
	A. Remove Rear Bearing Adapter ... ..	536
	B. Carry Out Dimensional Check ... ..	538
11.	Assemble HP Turbine Bearing Inner Track to HP Drive Shaft... ..	538
	A. Remove HP Turbine Slave Bearing Inner Track ... ..	538
	B. Assemble Bearing Inner Track ... ..	540
12.	Assemble Turbine Static Sub-Assembly to HP Exit Guide Vane Case ... ..	542
	A. Prepare for Assembly ... ..	542
	B. Assemble Sub-Assembly to Engine ... ..	542
13.	Calculate HP and LP Turbine Adjusting Washers Thickness ... ..	547
	A. Determine HP Turbine Adjusting Washer Thickness SB.72-94 ... ..	547
	B. Determine LP Turbine Adjusting Washer Thickness SB.72-94 ... ..	548
	C. Determine HP Turbine Adjusting Washer Thickness Pre-SB.72-94 ... ..	550
14.	Assemble HP Turbine Hub to Drive Shaft ... ..	550
	A. Prepare Turbine Hub for Assembly ... ..	550
	B. Assemble Turbine Hub ... ..	552
	C. Tighten HP Turbine Nut ... ..	552
15.	Assemble HP Turbine Rotor and Labyrinths... ..	554
	A. Assemble Turbine Rotor to Hub ... ..	554
	B. Assemble No.24 and 26 Labyrinth to HP Turbine Disk ... ..	556
	C. HP Turbine Rotor Blades Tip Clearance Check ... ..	558
	D. Adjusting Washer Proving Check... ..	560
	E. HP Turbine Rotor Swash Check ... ..	560
16.	Assemble and Secure the LP Turbine Nozzle Assembly to CCOC ... ..	561
	A. Assemble the Nozzle Assembly ... ..	561
17.	Calculate LP Turbine Adjusting Washer Thickness ... ..	563
	A. Adjusting Washer Checks ... ..	563

## ENGINE - ASSEMBLY

### 1. General

- A. Prior to commencing assembly, refer to 72-09-00 Assembly for general information.
- B. Throughout the text special tools are quoted by their Ref.No. e.g. (Tool 1234). For a complete list of tooling required for the assembly and for the manufacturer's Part No., refer to Special Tools, Fixtures and Equipment Table 1002.
- C. During the assembly procedure, reference will be made to the Illustrated Parts Catalogue (I.P.C.) to identify the items. To qualify from what sub-assembly or module the item belongs, the breakdown number will be quoted e.g. (72-20-00). In addition, because of the duplication of titles, e.g. nuts, bolts, washers, gears, housings etc., the item will be identified as bolt (72-20-00/1-10), the 1 referring to the I.P.C. Fig.No., and the 10 referring to the Item No.
- D. During the sub-assembly procedure, where the thickness of adjusting washers has to be determined, the words 'select' or 'select from the range' are used. If a range of washers is not available, it may be necessary to machine the washer to achieve the desired thickness. The information for machining washers is given under chapter 72-09-21 Repair. During the assembly procedure, the machining procedure reference will be given immediately after each adjusting washer I.P.C. Ref. No. in the appropriate part of the text e.g. select from the range the correct thickness adjusting washer (3-70) (72-09-21 Repair, Fig.401).
- E. This section details the sequence for assembling together all the sub-assemblies or modules comprising the complete engine. The assembly is carried out vertically, starting with the engine front sub-assembly or module at the bottom, and progressing upwards to the engine rear sub-assembly or module as illustrated in Fig.501.
- F. Prior to accepting for engine assembly a sub-assembly or module, ensure that they have been finalised on their sections, and that the modules have their identification plate attached qualifying that they are complete and ready for engine assembly.

- G. On completion of the engine assembly, refer to 71-00-01 Assembly for the removal of the engine from the building base to a horizontal stand, and the assembly of all external tubes and accessories, and for the assembly of the electrical harness refer to 71-00-02 Assembly.

## 2. Assemble Air Inlet Section to Building Base

### A. Prepare Building Base.

NOTE: Platforms (Tool 1308 and 967) are to be used at all times during engine build. Platforms not in use are to be stowed in the mobile stand (Tool 85).

- (1) Check for general cleanliness of the building base and ensure that it is securely clamped to the ramp platform, (Ref.Fig.503).
- (2) Check that the jacking fixture in the centre of the building base is in the retracted position, if not, retract the jack by rotating the handwheel located on the side of the building base in a counter-clockwise direction.

### B. Assemble the Air Inlet Section (Ref.Fig.503).

- (1) Ensure that the air inlet section has been cleared for engine assembly.
- (2) Assemble and secure the lifting fixture (Tool 1236) to the intake case. Raise the air inlet section, then remove the protectors from the front and rear of the LP bearing housing. Ensure that the LP bearing outer track and labyrinth seal are undamaged, then apply lubricant 'A' to the rollers of the outer track. Check that protective blanks have been assembled to the following positions:
  - (a) Air tube at vane No.2 outer location.
  - (b) Oil feed tube at vane No.3 outer location.
  - (c) Oil scavenge tube at vane No.4 outer location.
- (3) Lower the air inlet section onto the building base (Tool 1244) aligning the TOP of the intake (vane No.1 position) with the TOP of the building base. Release and remove the lifting fixture.

### 3. Assemble the LP Compressor Assembly to the Air Inlet Section

#### A. Prepare the LP Compressor Assembly.

- (1) Receive the compressor on the mobile stand (Ref.Fig. 502).
- (2) Assemble a lifting fixture (Tool 1096), if not already assembled, to the LP compressor assembly rear bearing adapter and secure with the captive bolts attached to the fixture plate. Attach a hoist to the lifting fixture.
- (3) Remove the slave nuts and bolts retaining the front bearing adapter to the LP case front flange. Place slave nuts and bolts in a container.
- (4) Carefully take the weight of the LP compressor assembly sufficiently to free the assembly from its spigot location in the front bearing adapter, then raise the compressor assembly clear of its stand.
- (5) Check that the pin (72-31-01/6-460) has been assembled to the TOP position (near the engine mounting bracket) of the LP case front flange.
- (6) Assemble an adapter (Tool 319) to the LP rotor shaft centre and retain with the four captive bolts (do not overtighten). Check that the LP roller bearing inner track has been correctly assembled to the LP rotor shaft front, and that it is free from damage, then apply lubricant 'A' to the LP bearing inner track. Check that the balancing weight retaining nuts (72-31-03/1-50) on the rotor shaft front are secure.

#### B. Assemble the LP Compressor Assembly (Ref.Fig.503).

- (1) Centralize the LP compressor assembly over the air inlet section, then adjust the compressor assembly until the location pin assembled to the TOP position of the LP case front flange is aligned with its corresponding pin hole at the TOP position in the intake case rear flange.

OVERHAUL

**CAUTION:** EXERCISE CARE WHEN LOWERING THE COMPRESSOR ASSEMBLY OVER THE BOLT PROTRUDING FROM HOLE 22 OF THE INTAKE CASE FLANGE.

- (2) Carefully lower the compressor assembly until the jacking adapter (Tool 319) is about to enter the roller bearing. Make a final check to ensure that the adapter enters the bearing centrally without fouling the rollers. Lower the compressor assembly onto the intake case. Temporarily assemble three equi-spaced fitted bolts to the compressor flange to align the compressor case and intake case bolt-holes.
- (3) Remove the hoist, then withdraw the three bolts temporarily assembled to the compressor flange. Apply lubricant 'B' to the flange bolts (72-22-01/4-30), then assemble them (less bracket positions) to the LP compressor/intake flange, boltheads face forward. Retain the bolts in position with self-locking nuts. Torque-tighten the nuts between 170 and 190 lbf in. (19,2 and 21,5 N.m), ensuring that they have a minimum locking (run-down) torque of 6.5 lbf in. (0,73 N.m). Refer to Fig.507 for the bracket positions.
- (4) Turn the handwheel, located on the side of the building base, in a clockwise direction until the jack firmly abuts the adapter assembled to the LP rotor shaft front.
- (5) Apply lubricant 'A' to the slave bearing in the front bearing adapter then assemble the protector (Tool 1369). Return the mobile stand, adapter, slave nuts and bolts to the compressor section.

C. Remove the LP Compressor Rear Bearing Adapter (Ref. Fig.504).

- (1) Unscrew 8 off captive bolts securing the lifting fixture (Tool 1096) to the rear bearing adaptor.
- (2) Remove immobilisers (Tools 3157 and 3158) using spanner (Tool 3164).
- (3) Unscrew the captive bolts securing the rear bearing adapter to the slave bearing assembly. Remove the slave bolts and nuts attaching the slave exit guide cases to the rear of the LP compressor case.

ASSEMBLY

OVERHAUL

- (4) Re-install lifting fixture (Tool 1096) and assemble the overhead hoist to the ring of the lifting fixture. Take the weight of the bearing adapter and at the same time check that all the captive bolts are free to move rearwards.
- (5) Slowly raise the rear bearing adapter/slave exit guide blade cases clear of the compressor assembly, then position and lower onto a container. Release the hoist from the lifting fixture, then return the adapter/cases together with the slave exit guide blade nuts and bolts to the compressor section.

CAUTION: DO NOT TOUCH THE BUILDING BASE HANDWHEEL AFTER REMOVING THE LP COMPRESSOR REAR BEARING ADAPTER.

- (6) If balancing weights have been assembled to the rim of the stage seven LP rotor disk, ensure that their retaining nuts have been correctly torque-tightened between 85 and 95 lbf in. (9,6 and 10,7 N.m). Temporarily screen off the rear of the compressor assembly with a suitable material prior to removing the slave bearing.

CAUTION: TOOLING ACCIDENTLY DROPPED CAUSING SUFFICIENT DAMAGE TO THE TRAILING EDGES OF STAGE SEVEN ROTOR BLADES WOULD RESULT IN A COMPLETE DISASSEMBLY OF THE COMPRESSOR ASSEMBLY.

D. Remove the Balancing Bearing Assembly (Ref.Fig.505).

- (1) Insert a sleeve (Tool 696) into the rear of the rotor shaft rear, then locate the immobilizer (Tool 280) in the rotor shaft internal splines. Ensure that the spanner (Tool 1594) is bolted to the multiplier (Tool 1022), then assemble the spanner to the nut and the multiplier to the immobilizer. It may be necessary to turn the square in the top of the multiplier to engage the square of the immobilizer.
- (2) Engage the wrench handle (Tool 1651) in the multiplier, then de-torque the bearing retaining nut. Remove the wrench, spanner/multiplier, immobilizer, and sleeve.

NOTE: The bearing retaining nut has a right-hand thread.

ASSEMBLY

OVERHAUL

- (3) Remove the retaining nut and washer from the rotor shaft rear. Remove spacer sleeve (Tool 3159).
- (4) Assemble the mechanical puller (Tool 283) to the rotor shaft rear.
  - (a) Lower the puller onto the rotor shaft rear and screw the central threaded shroud of the puller onto the rotor shaft rear. Engage sufficient threads of the threaded shroud to operate the puller, but do not overtighten.
  - (b) Lower the outer ring of the puller onto the balancing bearing aligning the captive bolts of the balancing bearing, with the tapped holes in the puller outer ring. Secure the puller to the balancing bearing outer location with the captive bolts.
- (5) Turn the puller T piece in a clockwise direction and remove the balancing bearing assembly. When the bearing becomes free of its interference location, unscrew the puller control shroud from the rotor shaft rear, then lift the puller and bearing assembly clear of the LP compressor assembly. Place the balancing bearing onto a suitable work top, then release and remove the puller from the bearing assembly.
- (6) On engines to pre SB.72-21 standard remove the slave adjusting washer from the LP rotor shaft rear. Return the slave adjusting washer (if applicable), packing piece and balancing bearing assembly to the LP compressor section.
- (7) On engines to SB.72-8896-347 standard, apply heat resisting aluminium touch-up enamel (PL82) to the rotor shaft rear on the area not protected by Sermetel W (Ref. Fig.505A). For procedure, refer to 72-09-04 Repair.

4. Assemble the Adjusting Washer, LP Thrust Bearing Assembly, Bevel Gear and Probe Operating Ring (Ref.Fig.506).

A. Prepare LP Bearing Assembly.

- (1) Remove the LP bearing assembly from its protective container and place on a clean surface. For pre SB.72-21 standard engines obtain the correct size adjusting washer (72-31-03/3-70-165), previously calculated by the compressor section. Measure the washer to establish that it corresponds with the figure recorded in the record sheets.
- (2) On SB.72-21 standard engines check the actual thickness of the engine adjusting washer assembled to the rotor shaft and make sure that it corresponds with the thickness logged in the relevant record sheet.
- (3) Check that the adjusting washer is free from nicks and burrs, lightly stone if necessary. Ensure that the rotor shaft rear washer abutment flange is free from damage marks. Apply lubricant 'A' to the LP thrust bearing location and adjusting washer, then assemble the adjusting washer to the rotor shaft rear.

OVERHAUL

- (4) Check that a blank has been assembled to the LP bearing housing transfer feed tube. Adjust the LP thrust bearing inner tracks until the thrust arrows coincide to form a "V". Ensure the LP bearing assembly is clean and free from damage marks.
- (5) With the correct size adjusting washer in position on the rotor shaft rear, assemble the LP thrust bearing assembly over the rotor shaft. Position the bearing assembly so that the thrust markings are in line with the master spline of the rotor shaft rear and that the arrows point forward.
- (6) Ensure that the adapter (Tool 284) is screwed onto the centre thrust plate of the mechanical driver (Tool 1099), then lower the drive onto the rotor shaft rear, and screw the central adapter (Tool 284) onto the shaft ensuring that it is not overtightened. Turn the T handle in a clockwise direction and press the thrust bearing assembly home. Unscrew the adapter, then remove the mechanical driver from the shaft.

B. Assemble the Adjusting Washer Bevel Gear and Retaining Nut.

- (1) Check that the six pins (72-32-00/1-30) assembled to the bevel gear (72-32-00/1-40) (Ref.SB.72-21) are undamaged, then temporarily assemble the locking washer (72-31-03/3-60) to the bevel gear to ensure that none of the six pins protrude above the locking washer abutment face. Remove the locking washer from the bevel gear.
- (2) Obtain the correct size bevel gear adjusting washer (72-32-00/1-50) previously calculated by the intermediate section. Measure the thickness of the washer to verify that it is the dimension logged in the engine record sheet.
- (3) Assemble the adjusting washer to the rotor shaft rear, then assemble the bevel gear (72-32-00/1-40) to the shaft, engaging the splines. Assemble the locking washer (72-31-03/3-60) to the six pins assembled to the bevel gear. Lubricate the retaining nut (72-31-03/3-50) with lubricant 'B', then assemble the nut to the shaft. Run the nut down initially with the hand spanner (Tool 1551).

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (4) Insert a sleeve (Tool 696) into the rear of the rotor shaft rear, then locate the immobilizer (Tool 280) in the rotor shaft internal splines. Ensure that the spanner (Tool 1594) is bolted to the multiplier (Tool 1022), then assemble the spanner to the nut and the multiplier to the immobilizer. It may be necessary to turn the square in the top of the multiplier to engage the square of the immobilizer. Assemble a torque wrench to the multiplier, then torque-tighten the retaining nut between 650 and 700 lbf ft (881 and 949 N.m). Remove the torque wrench, multiplier/spanner, immobilizer and sleeve. Lock the retaining nut by peening the locking washer at three equi-spaced positions.

C. Assemble the LP Probe Operating Ring. (Refer to SB.72-95).

- (1) Temporarily assemble the locking washer (72-31-03/3-20) to the probe ring (72-31-03/3-40) to ensure that the four locating pins assembled to the probe ring do not protrude above the nut abutment face of the locking washer. Remove the locking washer from the probe ring.

NOTE: The two lugs on the probe ring are diametrically opposite, one is a plain lug, whilst the other functions as the rotating member of LP bearing failure warning probe, its static member being attached to the oil distributor in the intermediate case. When assembling the probe ring it is imperative that the probe lug proper aligns the master spline of the LP rotor shaft rear.

- (2) Lower the probe ring (72-31-03/3-40) into the slots machined in the rotor shaft rear, ensuring that the probe lug aligns the master spline. Assemble the locking washer to the four locating pins (72-31-03/3-30) in the probe ring. Lubricate the retaining nut (72-31-03/3-10) with lubricant 'B', then screw the nut by hand onto the rotor shaft rear. Lower the immobilizer (Tool 1330) into the shaft engaging the splines of both items, then lower the spanner (Tool 325) onto the retaining nut. Lower the multiplier (Tool 1333) onto the spanner turning the multiplier drive (if necessary) to enable it to engage its drive in the immobilizer and its capscrews into the holes of the spanner. Assemble a torque wrench to the multiplier, then torque the retaining nut between 300 and 330 lbf ft (407 and 448 N.m). Remove the torque wrench, multiplier, spanner and immobilizer from the rotor shaft rear, then lock the retaining nut by peening the locking washer at three equi-spaced positions.

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (3) Assemble a protector (Tool 1227) to the rear of the LP compressor assembly.

5. Assemble the Brackets to the LP Compressor Case Front Flange

NOTE: The 116 bolts and nuts required for securing the flanges are of the same Part No., therefore the I.P.C. No. for the bolts (72-22-01/4-30, 60, 90, 120, 150, 180, 220, 250 and 300), and the I.P.C. No. for the nuts (72-22-01/4-20, 40, 70, 100, 130, 160, 190, 230, and 280) will not be quoted with each bracket assembled.

- A. Prepare the Brackets and Bolts (Ref.Fig.507).

NOTE: Boltheads are to face forward.

- (1) Starting in a clockwise direction and in numerical sequence looking forward from the TOP position, (No.1 bolt-hole) mark on the case with an approved marker the bracket positions (Ref.Fig.507) 36, 37, 45, 46, 47, 49, 50, 53, 54, 62, 63, 65, 66, 71 and 72.
- (2) Apply lubricant 'B' to the threads of all the bracket securing bolts.

- B. Assemble the Brackets.

- (1) Assemble a bracket (72-22-01/4-50) to position 36 and 37, retain the bracket, with two bolts and two nuts.

NOTE: Before assembling the following bracket (72-22-01/4-80) refer to SB.77-8.

- (2) Assemble a bracket (72-22-01/4-80) to position 45, 46 and 47, retain the bracket with three bolts and three nuts.
- (3) Assemble a bracket (72-22-01/4-110) to position 49 and 50, retain the bracket with two bolts and two nuts.
- (4) Assemble a bracket (72-22-01/4-200) to position 53 and 54, retain the bracket with two bolts and two nuts.
- (5) Assemble a bracket (72-22-01/4-170) to position 55 and 56, retain the bracket with two bolts and two nuts.
- (6) Assemble two brackets (72-22-01/4-210 and 4-140) to position 62 and 63, ensuring that bracket (4-210) is assembled to the flange first with the long leg extending forward, and bracket (4-140) assembled to bracket (4-210) with its leg extending rearward. Retain the brackets with two bolts and two nuts.

- (7) Assemble a bracket (72-22-01/4-240) to position 65 and 66, retain the bracket with two bolts and two nuts.
- (8) Assemble a pin (72-22-01/4-270) and retaining ring (72-22-01/4-260) to the bracket (72-22-01/4-290), then assemble the bracket to position 71 and 72 and retain with two bolts and two nuts.
- (9) Assemble a bolt (72-22-01/4-30) and nut (72-22-01/4-20) to the remaining vacant positions with the exception of bolt-holes 22, 57 and 61.
- (10) Torque-tighten the assembled LP compressor/air inlet section flange retaining bolts between 170 and 190 lbf in. (19,2 and 21,5 N.m), ensuring that they have a minimum locking (run-down) torque of 6.5 lbf in. (0,73 N.m).

6. Assemble the Module Plate Mounting Brackets and Identification Plates to the Mounting Brackets (Ref.Fig.508)

A. Assemble the Mounting Brackets.

- (1) Remove the two bolts and a spacer from the LP stage 2 bottom bolted vane position. Apply lubricant 'B' to two front flange bolts (72-22-01/4-30), then assemble them to positions 57 and 61 of the LP case front flange, retain the mounting bracket assembly (72-31-01/4-260) at this position with two nuts (72-22-01/4-20).
- (2) Secure the brackets (72-31-01/4-130 and 4-260) with the two bolts and spacer removed from the case in para.(1). The spacer is assembled between the case and the bracket. Torque-tighten the two bolts between 160 and 180 lbf in. (18,1 and 20,3 N.m), then wire-lock the bolts to each other.
- (3) Torque-tighten the two bolts securing the bracket (72-31-01/4-260) to the LP case flange at the bottom position (holes 57 and 61), between 170 and 190 lbf in. (19,2 and 21,5 N.m), ensuring that they have a minimum locking (run-down) torque of 6.5 lbf in. (0,73 N.m).

ASSEMBLY

OVERHAUL

B. Assemble the Module Identification Plates (Ref.Fig.508).

NOTE: After the sub-assemblies have been cleared for engine build, each sub-assembly will have attached its own module identification plate which will be checked on receipt to ensure that it bears the correct data. No module identification plate may be assembled to the mounting bracket on the engines LP compressor case until the relevant information has been marked on the identification plate and verified as being correct in accordance with the module interchangeability chart.

- (1) Starting nearest the LP case front flange and working rearwards, assemble the following Module Identification plates and engine nameplate. Apply lubricant 'B' to all the following retaining bolts.
  - (a) Assemble a module identification plate (72-00-06/1-160) to location 1, retain with two washers (72-00-06/1-150) and two bolts (72-00-06/1-140).
  - (b) Assemble a module identification plate (72-00-12/1-90) to location 2, retain with two washers (72-00-12/1-80) and two bolts (72-00-12/1-70).
  - (c) Assemble a module identification plate (72-00-07/1-50) to location 3, retain with two washers (72-00-07/1-40) and two bolts (72-00-07/1-30).
  - (d) Assemble a module identification plate (72-00-04/1-90) to location 4, retain with two washers (72-00-04/1-80) and two bolts (72-00-04/1-70).
  - (e) Assemble a module identification plate (72-00-05/1-90) to location 5, retain with two washers (72-00-05/1-80) and two bolts (72-00-05/1-70).
  - (f) Assemble a module identification plate (72-00-03/1-70) to location 6, retain with two washers (72-00-03/1-60) and two bolts (72-00-03/1-50).
  - (g) Assemble a module identification plate (72-00-02/1-70) to location 7, retain with two washers (72-00-02/1-60) and two bolts (72-00-02/1-50).

- (h) Assemble a module identification plate (72-00-01/1-70) to location 8, retain with two washers (72-00-01/1-60) and two bolts (72-00-01/1-50).
- (j) Assemble a module identification plate (72-31-01/4-250) to location 9, retain with two washers (72-31-01/4-240) and two bolts (72-31-01/4-230).
- (k) Assemble a module identification plate (72-31-01/4-220) to location 10, retain with two washers (72-31-01/4-210) and two bolts (72-31-01/4-200).
- (m) Assemble the engine identification plate (72-31-01/4-40) to location 11, then retain with four washers (72-31-01/4-20) and four bolts (72-31-01/4-30).
- (n) Assemble an identification engine nameplate (72-31-01/4-190) to location 12, retain with two washers (72-31-01/4-180) and two bolts (72-31-01/4-170).
- (p) Assemble a module identification plate (72-00-08/1-50) to location 13, retain with two washers (72-00-08/1-40) and two bolts (72-00-08/1-30).
- (q) Assemble a module identification plate (72-00-09/1-50) to location 14, retain with two washers (72-00-09/1-40) and two bolts (72-00-09/1-30).
- (r) Assemble a module identification plate (72-00-10/1-50) to location 15, retain with two washers (72-00-10/1-40) and two bolts (72-00-10/1-30).
- (s) Assemble a module identification plate (72-00-11/1-50) to location 16, retain with two washers (72-00-11/1-40) and two bolts (72-00-11/1-30).
- (t) Torque-tighten all of the module plate retaining bolts between 28 and 32 lbf in. (3,2 and 3,6 N.m).

7. Assemble the HP Compressor/Intermediate Assembly to the LP Compressor Assembly

A. Prepare for Dimensional Check (Ref.Fig.509).

NOTE: On pre SB.72-21 and SB.72-21 standard engines the LP compressor rotor is adjusted by means of the handwheel on the side of the building base, to produce the mean set dimension. This is from the

ASSEMBLY

OVERHAUL

rear face of the LP compressor rear flange to the rim of the stage 7 rotor disk. The dimension is rechecked on pre SB.72-21 standard engines as a washer proving check, after the HP compressor/intermediate assembly has been assembled to the LP compressor.

- (1) Remove the protective blanking cover from the rear of the LP compressor assembly.
- (2) Assemble the gauging bar (Tool 83) to the rear flange of the compressor case, secure the bar with the capscrews.
- (3) Turn the handle at the side of the building base to adjust the LP rotor until a 0.015 in. (0,381 mm) feeler gauge can be inserted between the gauging area of the bar and the rim of the stage 7 rotor disk.
- (4) Remove the gauging bar and place in a protective container.
- (5) Establish dimension 'G' if not already recorded during build of the LP Compressor Assembly (Ref. Assembly 72-31-00 para.2D).
  - (a) Support the bearing housing during measurement to compensate for bearing end float.
  - (b) Assemble the checking gauge (Tool 43) to the LP bearing housing (72-32-00/1-270) rear inner abutment face.
  - (c) Adjust the gauge so that the arm of the gauge contacts the rear inside face of the probe ring lug, then lock the gauge in this position (Ref. Fig.509).
  - (d) Remove the gauge, then by direct measurement, measure from the top of the arm to the LP bearing/gauge abutment face, record this as dimension 'G'. Place the gauge in its container (Tool 824).

ASSEMBLY

## B. Assemble the Metaflex Seal.

**NOTE:** The seal is received as a loose item. It must be new and unused, and have been lapped to produce a 0.003-0.008 nip (0,070-0,200 mm) by the intermediate case section. Refer to 72-32-00 for the lapping procedure.

- (1) Ensure that the seal location in the rear of the LP bearing assembly is clean. Do not apply jointing compound to the seal location.
- (2) Apply a light smear of jointing compound 'D' to both faces of the Metaflex seal (72-32-00/1-320), then assemble it to its location in the LP bearing assembly.

## C. Remove the HP Compressor/Intermediate Assembly from the Mobile Stand.

- (1) Check that the mobile stand has its brake applied, then remove the protector (Tool 210) from the rear (top) of the HP compressor assembly.
- (2) Identify the steady support (Tool 396) on the (bottom) front of the intermediate inner case, then unscrew the jacking wheel and lower the LP drive shaft until it is supported internally. Release and remove the steady support from the inner case.
- (3) Assemble the overhead hoist to the alignment locking tool (Tool 835), then raise the tool above the HP compressor assembly until the tool aligns the LP drive shaft. Slowly lower the alignment locking tool into the LP drive shaft a few inches, then assemble the split guide (Tool 838) into the end of the LP drive shaft and the split sleeve (Tool 836) around the locking tool. Continue to lower the alignment locking tool until the split sleeve engages the split guide, then release the hoist.
- (4) Screw the lifting fixture (Tool 837) onto the HP drive shaft, then attach a hoist to the lifting equipment.
- (5) Release the clamps securing the HP compressor assembly to the mobile stand. Slowly raise the assembly until it is clear of the stand and at a convenient height for inspection of the intermediate case.

ASSEMBLY

OVERHAUL

- D. Determine thickness of LP bearing failure probe adjusting washers (Ref. Fig.509).

**CAUTION:** THE FRANGIBLE PROBES ARE SUSCEPTIBLE TO DAMAGE DURING THE SETTING PROCEDURE, AND IF KNOCKED WHILST BEING ASSEMBLED THEY SHOULD BE REMOVED AND SUBJECTED TO AN INSPECTION FOR CRACKING AND DISTORTION. IF A PROBE IS FOUND DAMAGED IT SHOULD BE REJECTED.

**NOTE:** If the dimension 'D' and the thickness of the adjusting washers (72-32-00/3-180) were recorded during assembly of the Intermediate Case Assembly to the HP Compressor Assembly (Ref. Assembly 72-33-00 para.11E), proceed to para.(4).

- (1) Measure and record the thickness of the two probe adjusting washers (72-32-00/3-180).
- (2) Assemble the two adjusting washers, the probe and probe retainer (72-32-00/3-170, 160) to the intermediate case and temporarily secure them with bolts (72-32-00/3-150).
- (3) Measure from the front face of the intermediate case (inner) flange to the rear face of the probe and record as dimension 'D'.
- (4) Obtain dimension 'G' recorded during dimensional check (Ref. para.7.A (5)).
- (5) Using the following formula, calculate the required thickness of the LP probe adjusting washers (72-32-00/3-180) to produce the desired clearance between the probe and probe operating ring of between 0.024 and 0.029 in. (0,609 and 0,736 mm) for SB.72-21 standard, or between 0.020 and 0.025 in. (0,508 and 0,635 mm) for pre-SB.72-21 standard engines.
  - (a) The required adjusting washer thickness =  

$$D + (\text{size of washer assembled for check}) + (\text{desired clearance}) - G.$$
- (6) If adjustment is required, select two adjusting washers (72-32-00/3-180) that will produce a clearance between 0.024 and 0.029 in. (0,609 and 0,736 mm) for SB.72-21 standard, or between 0.020 and 0.025 in. (0,508 and 0,635 mm) for pre-SB.72-21 standard engines.

OVERHAUL

sneema

Printed in England

- (7) Remove the LP probe and retainer (72-32-00/3-170, -160) from the oil distributor, then remove the two adjusting washers used for the check.
- (8) Reassemble the LP probe, retainer and the two selected adjusting washers (72-32-00/3-180) (72-09-21 Repair, Fig.407) to the oil distributor. Secure the probe with two bolts (72-32-00/3-150) lubricated with lubricant 'A'. Torque-tighten the bolts to 135 lbf in. (15,2 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).

E. Lower the HP Compressor/Intermediate Assembly onto the Spacers (Ref.Fig.510).

CAUTION: THE FRANGIBLE PROBES ARE SUSCEPTIBLE TO DAMAGE DURING ASSEMBLY OF THE ENGINE MODULES, AND IF KNOCKED THEY SHOULD BE REMOVED AND SUBJECTED TO AN INSPECTION FOR CRACKING AND DISTORTION. IF A PROBE IS FOUND DAMAGED IT SHOULD BE REJECTED.

- (1) Ensure that the LP and HP bearing failure warning probes assembled to the inner case are undamaged, and that the inner and outer front flanges of the intermediate case are free from damage.
- (2) Ensure that the oil transfer tube (72-32-00/3-370) has been assembled to the distributor in the intermediate case, and the oil transfer tube (72-32-00/3-340) has been assembled to the rear location on the LP bearing housing.
- (3) Offer up the spherical mounting setting tool (Tool 839) to the rear of the LP rotor shaft. Identify the master spline of the spherical mounting, then observe the master spline through the observation hole in the setting tool. Engage the splines of the setting tool with those of the spherical mounting. Turn the setting tool until the master spline of the LP rotor shaft rear aligns the corresponding master spline in the rear flange of the setting tool, then allow the setting tool to drop fully home into the locking cone. Withdraw the setting tool ensuring it is not turned.

ASSEMBLY

72-00-00

Page 523  
Dec 31/01

OLYMPUS 593

MK.610-14-28  
OVERHAUL

sneema

**NOTE:** The master spline of the spherical mounting is now set 45 deg relative to the master spline in the locking cone and ready to receive the LP shaft. Do not touch the spherical mounting after setting.

- (4) Assemble three spacers (Tool 804) equi-spaced to the rear face of the LP compressor case. Retain the spacers with thumbscrews.

**NOTE:** The spacers (Tool 804) allow the HP compressor assembly to be temporarily supported, leaving a clearance between the LP drive shaft and spherical mounting, permitting the LP drive shaft to be rotated in a free state allowing accurate alignment with the locking system prior to engagement.

- (5) Observe the master spline of the rotor shaft rear, then using suitable chalk, mark the rotor shaft rear on the outside in line with the spline.

**NOTE:** The chalk mark will assist in lining up the master spline with the LP drive shaft master spline.

- (6) Raise and position the HP compressor assembly above the LP compressor assembly.

**CAUTION:** BEFORE LOWERING THE ASSEMBLY ENSURE THAT THE PROBE LUG OF THE OPERATING RING IS NOT IN LINE WITH THE PROBE ASSEMBLED TO THE OIL DISTRIBUTOR IN THE INTERMEDIATE CASE.

- (7) Align the rotor shaft and LP drive shaft master splines. Check that the TOP of the HP compressor/intermediate case assembly aligns with the TOP of the LP compressor assembly, then lower the assembly, exercising care, onto the spacers. Secure the spacers to the intermediate case front flange with thumbscrews. Release the hoist and lower the lifting fixture onto the rear bearing adapter.

- (8) Assemble the lifting fixture (Tool 981) to the overhead hoist, then lower the lifting fixture over the LP drive shaft. Engage the half clamps into the recess in the rear of the shaft, then lock the half clamps together with the pivoting bolt.

OVERHAUL

- (9) Operate the hoist until the weight of the LP drive shaft is taken up allowing the shaft to turn freely.
- (10) Support the alignment/locking tool and withdraw the split sleeve, then allow the tool to move forward to engage with the spherical mounting and locking cone. Slight angular adjustment of the LP drive shaft may be necessary to effect engagement.
- (11) Turn the central part of the alignment/locking tool 45 deg in a clockwise direction to unlock the spherical mounting.
- (12) Attach the lifting fixture already assembled to the HP drive shaft to a hoist. Take the weight of the HP compressor/intermediate assembly, then release and remove the three spacers assembled to the rear flange of the LP compressor case.
- (13) Assemble four packing pieces (Tool 1200) and two packing pieces (Tool 1201) to the rear flange of the LP case, secure with thumbscrews.
- (14) Remove the seven bolts retaining the blanking plate at the LP pulse probe drive location (intermediate case vane No.4), then remove the plate.
- (15) Check that the TOP marked on the LP bearing housing aligns the TOP marked on the intermediate case (vane No.1 position). Observe the six dowels assembled to the front inner flange of the intermediate case, then ensure that they align with their corresponding location holes in the LP bearing housing flange.

**CAUTION:** EXERCISE GREAT CARE WHEN LOWERING  
COMPRESSOR/INTERMEDIATE ASSEMBLY,  
ENSURING THAT LP DRIVEN BEVEL GEAR DOES  
NOT ABUT LP DRIVING GEAR.

- (16) Ensuring that the dowels in the intermediate case engage in the holes in the LP bearing housing flange, slowly lower the HP compressor/intermediate assembly, simultaneously turning the LP pulse probe drive shaft to ensure that the LP pulse probe driven bevel meshes smoothly with the LP gear and the teeth do not abut. When the intermediate case abuts the packing pieces secure the case to the packing pieces with slave bolts and nuts.
- (17) Release the hoist and lower the lifting fixture onto the rear bearing adapter.

ASSEMBLY

F. Lock the Spherical Mounting.

- (1) Partially lock the spherical mounting by turning the central part of the alignment/locking tool approximately 5 deg in a counter clockwise direction.
- (2) Assemble a Salter 400 lb (181.4 kg) spring balance (Tool 1631) to the overhead hoist, then assemble the spring balance to the LP shaft lifting equipment already in position. Slowly raise the LP shaft until the shaft is suspended by the spring balance, then record the weight registered on the spring balance. Continue to raise the shaft until a slight increase in weight is noted on the dial of the spring balance.

NOTE: The LP drive shaft is now in contact with the partially locked spherical, any further increase in weight is unnecessary.

- (3) Turn the central part of the alignment/locking tool counter clockwise approximately 45 deg to bring the spherical mounting into the fully locked position. A decrease in the weight factor will be observed on the dial of the spring balance.
- (4) Carefully lower the hoist, then remove the spring balance and lifting equipment. Attach the hoist to the alignment/locking tool, then carefully withdraw the tool and split guide from the LP shaft. Place the alignment tool in its container (Tool 803).

G. Secure the Inner and Outer LP Bearing Housing Baffles to the Intermediate Case.

- (1) Apply lubricant 'A' to the 30 externally relieved body bolts (72-32-00/1-20) of the LP bearing housing, then engage the bolts in the tapped holes in the intermediate inner case and screw in until finger tight.

ASSEMBLY

72-00-00

Page 527

MK.610-14-28  
OVERHAUL

sneema

- (2) Calibrate the ratchet wrench (Tool 1542) and torque wrench (Tool 1541) on the torquemeter gauge to a torque of 135 lbf in. (15,2 N.m), then torque-tighten the 30 captive bolts to 135 lbf in. (15,2 N.m), ensuring that they have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).

NOTE: The seals, assembled in the following operation, are located by six equi-spaced dowels, the correct assembly position of the seal is determined by aligning the cut-away in the seal (this is 30 deg relative to the centre location hole in the seal) with the headless pin (72-32-00/6-40) located in the intermediate case. The angular position of the pin is 90 deg relative to the 'TOP' of the intermediate case and falls between vane No.2 and 3.

- (3) Identify the cut-away on the two seals (72-31-02/1-30), then assemble them to the front outer baffle of the LP bearing housing positioning the gaps correctly. Retain the seal rings to the outer baffle with the 24 externally relieved bolts (72-32-00/1-10) lubricated with lubricant 'A'. Calibrate the ratchet wrench (Tool 822) and torque wrench (Tool 821) on the torquemeter gauge to a torque of 135 lbf in. (15,2 N.m). Torque-tighten the 24 retaining bolts to 135 lbf in. (15,2 N.m), ensuring that they have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).

#### H. Re-check the Set Dimension.

NOTE: The dimensional check (para.(2) to (6) inclusive) is applicable to Pre SB.72-21 engines only.

- (1) With the seals correctly positioned and the 54 LP bearing housing/intermediate case bolts torque-tightened, turn the handwheel, located on the side of the building base, in a counter clockwise direction allowing the LP rotor to move forward, now supported by the LP bearing housing/intermediate case.
- (2) Carefully insert the gauging bar (Tool 83) between the intermediate case front flange and the LP compressor case rear flange, then secure the bar to the LP compressor case flange with the capscrews.

ASSEMBLY

72-00-00

Page 528

Dec 31/01

OLYMPUS 593

MK.610-14-28 *sneema*  
OVERHAUL

- (3) Using feeler gauges, measure the gap which exists between the gauging bar and the rim of the stage 7 rotor disk. Reposition the gauging bar and repeat the check diametrically opposite.
- (4) Subtract the mean dimension obtained, from the actual dimension marked on the gauging bar.
- (5) The set gap dimension must be between 1.730 and 1.725 in. (43,942 and 43,815 mm).

Example - If the distance measured by the feeler gauges is 0.015 in. (0,381 mm), then subtract this from say 1.742 in. (44,246 mm) marked on the gauging bar, and the resultant dimension would be 1.727 in. (43,865 mm), acceptable as mid tolerance between the desired set gap dimension.

ASSEMBLY

OVERHAUL

sneema

- (6) Remove the gauging bar from the LP compressor case flange and place it in a protective container.
- (7) Check the backlash between the LP zero l bevel driving gear and the LP zero l bevel driven gear (LP pulse probe drive) (Ref. Fits and Clearance Schedule (72-32-00) F.C.S.438).

If the LP drive gears backlash check has been carried out on the Intermediate Case Assy. during final assembly (Ref.72-32-00 Sub-Assembly Para.11A), proceed as follows:

Check for backlash by moving the pulse probe bevel gearshaft through the drive housing aperture. Loss of movement indicates fouling of gear teeth.

- (8) Following satisfactory dimensional and backlash checks, reassemble the blank to the LP pulse probe drive position (vane No.4). Apply lubricant 'B' to the seven bolts, then secure the blank. Torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m), ensuring that they have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).
- (9) If for any reason work is to be discontinued at this stage for any period of time, blank off the gap which exists between the LP compressor and intermediate case with blank (Tool 995).

NOTE : If the set dimension is outside the limits, it may be necessary to change the LP thrust bearing adjusting washer. A thicker adjusting washer decreases the set dimension and conversely a thinner washer increases the dimension. Inspection supervision must be consulted before any decision is reached concerning a washer change.

#### J. Change the LP Compressor Thrust Bearing Adjusting Washer if Required.

- (1) Remove the LP thrust bearing assembly and adjusting washer (Ref.72-00-00 Disassembly).
- (2) Assemble the LP bearing adjusting washer (Ref.para.4.A.(2)).
- (3) Reassemble the LP compressor intermediate assembly to the LP compressor assembly (Ref.para.7).

Checking the Bearing Failure Warning Probe Circuit  
Figure 511

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

8. Air Flow and Pressure Check of the LP and HP Compressor Thrust Bearing Failure Warning Probe Circuit (Ref.Fig.511)

NOTE : This check will indicate whether or not a bearing failure warning probe has been 'knocked off' during assembly.

A. Prepare Test Equipment.

- (1) Examine the adapter (Tool 802) for cleanliness and serviceability of the two gauges, then remove the protector from the LP/HP bearing failure warning feed back tube at vane No.2 of the intermediate case.
- (2) Assemble the adapter to the feedback tube, then connect a flexible hose between the adapter and a moisture free air supply.

B. Carry Out Air Flow Check.

- (1) Turn on the air supply and regulate the supply until 15 psig (105 Kpa) is registering on the P<sub>1</sub> gauge. With 15 psig (105 Kpa) registering on P<sub>1</sub> gauge, P<sub>2</sub> gauge should register between 6.1 and 7.5 psig (43 and 53 Kpa). If there is a slight variant at P<sub>2</sub>, then check for leaks at the feedback tube connection and repeat the check. If a probe has been 'knocked off', then no pressure, or a very low pressure will be observed on the P<sub>2</sub> gauge.
- (2) If the check is satisfactory, remove the adapter then reassemble the protector to vane No.2. If a probe has been 'knocked off', refer to the following Chapters and use the appropriate text in each Chapter.
  - (a) Engine (72-00-00 Disassembly).
  - (b) Intermediate Case (72-32-00 Assembly).
  - (c) Engine (72-00-00 Assembly Ref.para.7.).
- (3) If no further work is to be carried out immediately, blank off the gap between the LP compressor and intermediate cases with protector (Tool 995).

9. Assemble the Exit Guide Vane Cases and Flange Brackets

A. Assemble the Cases (Ref.Fig.512).

- (1) Check that the exit guide vane (e.g.v.) cases (72-31-02/1-150) are a matched pair and free from damage.

ASSEMBLY

72-00-00

Page 531

Dec 1/87

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (2) Attach the lifting fixture, already assembled to the HP drive shaft, to a hoist. Loosen the nuts securing the six packing pieces to the intermediate case two or three threads. Using extreme care so as not to lift the complete assembly from the build stand, raise the hoist to take the weight of the HP compressor/intermediate case off the packing pieces without loading the bolts attached to the intermediate case.
- (3) Release and remove the three packing pieces assembled to the top half of the LP compressor case and intermediate case flanges.

NOTE: Lubricant 'B' to be applied to all bolt threads in the following operations.

- (4) Identify the top half of the e.g.v. cases, then assemble the case between the LP compressor case and intermediate case flanges aligning the dowel holes of the e.g.v. with the corresponding dowel holes in the LP compressor case rear flange and the intermediate case front flange. Check that the e.g.v. retaining ring (72-31-02/1-60) engages with the seal (72-31-02/1-30) assembled to the front outer labyrinth housing (72-32-00/1-350) of the LP bearing housing. If necessary lightly tap the case with an appropriate mallet to align the bolt holes. Temporarily assemble six bolts (72-31-01/6-160) and nuts (72-31-01/6-150) to equi-spaced positions to align and hold the top and bottom flanges of the top half case in their correct position.
- (5) Remove the slave plates (gearbox mounting bracket positions) from the intermediate case front flange.
- (6) Release and remove the three packing pieces assembled to the bottom half of the LP compressor case and intermediate case flanges. Wipe these flanges clean, then assemble the bottom half of the e.g.v. case to the engine at the same time observing the seal engagement between the e.g.v. retaining ring (72-31-02/1-60) and the front outer labyrinth housing location of the LP bearing housing.
- (7) Temporarily assemble six equi-spaced bolts (72-31-01/6-160) and six nuts (72-31-01/6-150) to the front and rear flanges of the bottom e.g.v. case.

- (8) Assemble a pin (72-32-00/6-20) through the intermediate case front flange and e.g.v. rear flange (flange of pin to rear of engine). Secure the pin with a plate (72-32-00/6-10), then retain the plate with two bolts lubricated with lubricant 'B' and two nuts.
- (9) Assemble a pin (72-31-01/6-130) through the e.g.v. case front flange and LP compressor case rear flange, retain the pin with a retaining plate (72-31-01/6-120), two bolts (72-31-01/6-140) lubricated with lubricant 'B' and two nuts (72-31-01/6-110).
- (10) Apply lubricant 'B' to six bolts (72-31-02/1-20), then assemble them to the axial positions of the exit guide vane cases with the boltheads to the TOP of the engine. Retain the bolts with nuts (72-31-02/1-10).
- (11) Lower the HP compressor/intermediate case onto the exit guide vane cases. Release and remove the lifting fixture from the HP drive shaft and hoist.
- (12) Assemble two hollow pin retainers (72-32-00/7-170) to the rear exit guide flange (left-hand gearbox mounting bracket location), secure the retainers at the inner station with bolts (72-32-00/7-140) lubricated with lubricant 'A', and at the outer station with nuts (72-32-00/7-150) and bolts (72-32-00/7-160) lubricated with lubricant 'A'. Do not tighten at this stage.
- (13) Assemble the retaining plate (72-32-00/8-140) to the rear exit guide flange (right-hand gearbox mounting bracket location), secure the retainer with bolts (72-32-00/8-130) lubricated with lubricant 'A'. Do not tighten the bolts at this stage.

**B. Assemble Brackets to the LP Compressor Case/Exit Guide Vane Case Flanges.**

- (1) Attach suitable tape to the exit guide vane case, then mark off the bracket positions, starting at the No.1 bolt-hole position and numbering clockwise looking forward.

NOTE: Remove any temporarily assembled bolts occupying bracket positions.

- (2) Assemble brackets, bolts and nuts in accordance with Fig.513. Do not tighten the bolts at this stage.

OVERHAUL

C. Assemble Brackets to the Exit Guide Vane/Intermediate Case Flanges.

- (1) Attach suitable tape to the exit guide case, then mark off the bracket positions starting at the No.1 bolt-hole position and numbering clockwise looking forward.
- (2) Assemble the brackets, bolts and nuts in accordance with Fig.514.

D. Torque-tighten the Axial Bolts and Flange Bolts.

- (1) Using spanner (Tool 1585) and a torque wrench, torque-tighten the axial joint bolts between 170 and 190 lbf in. (19,2 and 21,5 N.m), ensuring that they have a minimum locking (run-down) torque of 6.5 lbf in. (0,73 N.m).
- (2) Torque-tighten the 48 LP compressor case/exit guide vane case flange bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m), ensuring that they have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).
- (3) Torque-tighten the exit guide vane case/intermediate case flange bolts.
  - (a) Torque-tighten the bolts at holes 29, 30, 31, 32, 33 and 34 between 67 and 73 lbf in. (7,57 and 8,25 N.m), ensuring that they have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 2.5 thread pitches beyond nut chamfer, the bolt must be renewed. Failure to obtain this protrusion at positions 31, 32, 33 and 34, refer to SB.72-8404-234.
  - (b) Torque-tighten the remaining bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m), ensuring that they have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).

- (4) Remove the tape from the exit guide vane cases.

10. Check HP Compressor Adjusting Washer Setting

A. Remove Rear Bearing Adapter.

- (1) Attach the overhead hoist to the multiple leg sling (1054), then assemble the sling to the rear bearing adapter and secure with the three thumbscrews.
- (2) Remove the slave nuts and bolts retaining the rear bearing adapter to the HP compressor case rear.
- (3) Slowly raise the bearing adapter until the adapter clears the LP drive shaft, then lower onto a suitable pallet. Place the slave nuts and bolts in a canvas bag and attach to the adapter.

ASSEMBLY

- (4) Apply lubricant 'A' to the slave bearing assembled to the rear of the adapter, then assemble a protector (Tool 1370) to the adapter to protect the bearing.

B. Carry Out Dimensional Check.

- (1) Place a straight edge across the HP compressor case rear flange, then position the straight edge as near as possible to the HP drive shaft (Ref.Fig.515).
- (2) Using a depth gauge measure from the rear face of the HP case flange to the rim of the stage 7 rotor disk (between the blades not on the blade platform). The distance must be within the dimensions quoted in the Fits and Clearance Schedule (72-00-00) FCS 120. Repeat the check at 90 deg, 180 deg and 270 deg. Add the four sets of figures together then divide by 4 to obtain the mean dimension. Record the dimension.
- (3) If the figure obtained is satisfactory, assemble a protector (Tool 1237) to the rear of the HP compressor assembly.
- (4) If the check is unsatisfactory, consult inspection supervision before carrying out any rectification.
- (5) If the HP adjusting washer has to be changed, refer to the following Chapters and use the appropriate part of the text in each Chapter.
  - (a) Engine (72-00-00 Disassembly).
  - (b) HP Compressor Assembly (72-33-00 Disassembly).
  - (c) HP Compressor Assembly (72-33-00 Assembly).
  - (d) Engine (72-00-00 Assembly).

11. Assemble HP Turbine Bearing Inner Track to HP Drive Shaft

A. Remove HP Turbine Slave Bearing Inner Track (Ref.Fig.516).

- (1) Ensure that the hydraulic cylinder is assembled between the two parts of the mechanical puller (Tool 1019) (Ref.detail A), then unscrew the extraction claws.
- (2) Carefully lower the mechanical puller over the LP drive shaft and screw the end fitting fully onto the HP drive shaft.

- (3) Screw each extraction claw fully into position in the recesses under the slave bearing inner track, then lock by tightening the small screw located near each knurled nut (Ref.detail B).
- (4) Connect the hand pump hose to the hydraulic cylinder, then apply sufficient pressure through the hand pump to gradually remove the slave bearing. When the slave bearing is released, release and withdraw the extraction claws from under the bearing.

CAUTION: EXERCISE CARE DURING REMOVAL OF SLAVE BEARING TRACK TO PREVENT DAMAGE TO DRIVE SHAFTS.

- (5) Disconnect the hand pump hose from the cylinder, then unscrew the end fitting from the HP drive shaft and remove the mechanical puller from the drive shafts. Withdraw the slave bearing from the drive shafts and place in a container.

B. Assemble Bearing Inner Track (Ref.Fig.516).

- (1) Release and remove the hydraulic cylinder from between the two parts of the mechanical puller (Tool 1019), then assemble the cylinder above the outer part (Ref.detail C).
- (2) Unscrew the extraction claws as far as possible to ensure that they will not be in contact with the bearing track.
- (3) Ensure thorough cleanliness of the shaft and bearing inner track (72-33-02/3-120), then with the identification markings on the track edge uppermost, carefully lower the bearing track into position on the HP drive shaft.
- (4) Carefully lower the mechanical puller over the LP drive shaft and screw the end fitting fully onto the HP drive shaft. Adjust the mechanical puller until the extraction claw mounting flange is correctly located on the bearing track (Ref.detail D).
- (5) Connect the hand pump to the hydraulic cylinder, then operate the pump until the bearing track is pressed fully into position on the HP drive shaft.

(6) Disconnect the hand pump from the cylinder, then unscrew and remove the mechanical puller from the drive shaft.

(7) Ensure that the bearing track is correctly installed.

12. Assemble Turbine Static Sub-assembly to HP Exit Guide Vane Case

A. Prepare for Assembly (Ref.Fig.517).

(1) Check the HP compressor exit guide vanes tip clearance.

(a) Obtain dimension X from the Turbine Static Sub-assembly record (Ref.72-00-51 para.9.B.). Record as dimension A.

(b) Obtain the exit guide vanes diameter from the HP Compressor Case and Vanes Sub-assembly record (Ref.72-33-01 para.2.). Record as dimension B.

(c) Calculation to obtain exit guide vanes tip clearance detailed in Fits and Clearances Schedule (72-34-00) F.C.S.135 =  $B - A$  divided by 2. Record the calculated clearance.

(2) Place the HP drive shaft guide sleeve (Tool 1202) onto the rear end of the HP compressor drive shaft with the chamfer of the sleeve uppermost.

(3) Attach a crane hoist to the lifting fixture attached to the rear of the CCOC, then carefully raise and position the sub-assembly over the HP compressor assembly.

(4) Insert four guide pins (Tool 1304) at equi-spaced positions into the front flange of the HP compressor diffuser case. Note the position of the locating pin at the top position on the HP compressor exit guide blade case flange.

B. Assemble Sub-assembly to Engine.

CAUTION: EXERCISE GREAT CARE TO AVOID DAMAGE TO BEARING AND LABYRINTHS.

(1) Carefully lower the sub-assembly over the LP and HP drive shafts and into position on the HP compressor case aligning the top positions. Withdraw the guide pins.

- (4) On completion of the flange securing procedure, apply lubricant 'C' to the four bolts (72-33-01/3-60), then assemble the bolts and sleeves (72-33-01/3-70) to the HP compressor exit guide vane case (Ref. detail D). Torque-tighten the bolts to 100 lbf in. (11,5 N.m) then wire-lock the bolts.
- (5) Assemble the single inspection port retaining plate to the HP compressor rear case (Ref. detail D) (single inspection port; Mod.8039 cases only).
- (a) Apply lubricant 'C' to the securing bolts (72-33-01/3-60, 74) and lubricant 'A' to the blanking plug (72-33-01/3-73).
- (b) Position the retaining plate (72-33-01/3-75) and secure it with one bolt. Assemble a bolt and a sleeve (72-33-01/3-70) to the retaining plate location. Torque-tighten the bolts to 100 lbf in. (11,5 N.m).
- (c) Screw the blanking plug into the retaining plate, and torque-tighten to 65 lbf in. (7,3 N.m).
- (d) Wire-lock the bolts and the plug together.
- (6) Assemble the double inspection port mounting block to the HP compressor rear case (Ref. detail D) (double inspection port; post Mod.8039 cases only).
- (a) Apply lubricant 'C' to the securing bolts (72-33-01/3-90) and lubricant 'A' to the blanking plugs (72-33-01/3-80).
- (b) Position the mounting block (72-33-01/3-100), and secure it with the bolts. Torque-tighten the bolts to 100 lbf in. (11,5 N.m) and wire-lock.
- (c) Ensure the thorough cleanliness of the spherical sealing surfaces of the blanking plugs, and screw them into the mounting block.
- (d) Torque-tighten each plug in turn in gradual stages until both reach a torque of 70 lbf in. (7,9 Nm). Wire-lock the plugs together.
- (7) Release and remove the lifting equipment from the rear of the CCOC, then withdraw the guide sleeve from the end of the HP drive shaft.

### 13. Calculate HP and LP Turbine Adjusting Washers Thickness

- A. Determine HP Turbine Adjusting Washer Thickness SB.72-94 (Ref.Fig.519).

NOTE: This procedure conforms to module interchangeability requirement.

- (1) Measure the distance from the rear flange face of the CCOC to the rear face of the previously installed bearing inner track. Record as dimension W.
- (2) Obtain dimension B from the HP Turbine Sub-assembly records (Ref.72-51-03 para.7.B.). Record as dimension X for this calculation.
- (3) Obtain the Set Gap dimension from the Fits and Clearance Schedule 72-00-00 F.C.S.237.
- (4) Using the following formula, calculate the required adjusting washer thickness. Thickness of the washer required =  $W - \text{Set Gap dimension} + X$ . Obtain a washer from the range (72-51-04/1-35 to 115) (72-09-21 Repair, Fig.421).
- (5) Lightly mark the edge of the washer with the base module number. The washer must be retained permanently with the base module.

- B. Determine LP Turbine Adjusting Washer Thickness SB.72-94 (Ref.Fig.519).

NOTE: This procedure conforms to module interchangeability requirement.

- (1) Assemble the split sleeves (Tool 1058) between the HP rotor shaft rear and the LP rotor shaft. Do not tighten the securing screws at this stage.
- (2) In order to ensure that the LP rotor shaft is fully forward check that the jacking fixture on the building base at the front end of the engine is fully retracted. To achieve this, the handwheel on the side of the building base must be turned in a counter-clockwise direction.
- (3) Tighten the split sleeves securing screws.

ASSEMBLY

72-00-00

Page 548

OVERHAUL

- (4) Measure and record the distance from the rear flange face of the CC0C to the LP turbine adjustment washer abutment face on the rotor shaft. Record as dimension Y.
- (5) Obtain the LP drive shaft/rotor rear end-float dimension from the LP compressor drive shaft sub-assembly records (Ref.72-31-04 para.5.B.(4)). Record as dimension Z for this calculation.
- (6) Obtain the Set Gap dimension from the Fits and Clearance Schedule 72-00-00 F.C.S.239.
- (7) Using the following formula, calculate the required adjusting washer thickness. Thickness of washer required = Set Gap dimension - (Y + Z). Obtain a washer from the range (72-31-04/2-25 to 90) (72-09-21 Repair, Fig.402).
- (8) Lightly mark the edge of the washer with the base module number. The washer must be retained permanently with the base module.

OVERHAUL

- C. Determine HP Turbine Adjusting Washer Thickness  
Pre-SB.72-94 (Ref.Fig.519).

NOTE: This procedure does not conform to module  
interchangeability requirement.

- (1) Measure the distance from the rear flange face of the CCOC, to the rear face of the previously installed bearing inner track. Record as dimension W.
- (2) Obtain dimension A from the Turbine Static Sub-assembly records (Ref.72-00-51 para.34.B). Record as dimension X for this calculation and the adjusting washer proving check.
- (3) Obtain dimension A from the HP Turbine Sub-assembly records (Ref.72-51-03 para.7.A). Record as dimension Y for this calculation.
- (4) Using the following formula, calculate the required adjusting washer thickness. Thickness of washer required =  $(W) - (X + Y - 1.990 \text{ in.})$ .
- (5) Obtain a washer from the range (72-51-04/1-40 to 110) (72-09-21 Repair, Fig.421) and record the thickness of the washer to be installed.

#### 14. Assemble HP Turbine Hub to Drive Shaft

- A. Prepare Turbine Hub for Assembly (Ref.Fig.520).

- (1) Lower the adjusting washer of the correct thickness over the LP drive shaft and into position on the HP drive shaft.
- (2) Remove the split sleeves located between the HP and LP drive shafts.
- (3) Assemble the bolts (72-51-04/1-180) numbered 1 to 10 to the turbine hub.
  - (a) Insert No.1 bolt rearward through the hub in line with the master spline in the hub bore. Secure the bolt by assembling a retaining ring (72-51-04/1-170) to the recess in the bolt using the sleeve (Tool 1224).
  - (b) Assemble the remaining bolts and retaining rings in numerical order in a clockwise direction when viewing the hub from the rear.

OVERHAUL

**B. Assemble Turbine Hub.**

- (1) Remove the protector from the hub and ensure thorough cleanliness of components. Align the master splines of the shaft and hub and slide the hub fully into position on the shaft.
- (2) Lower the keywasher (72-51-04/1-30) over the shaft and engage the lugs with the locations in the turbine hub, then place the washer (72-51-04/1-20) in the keywasher.
- (3) Apply lubricant 'A' to the shaft thread and retaining nut (plain round nut) (72-51-04/1-10), then screw the nut onto the shaft ensuring that the nut abutment face abuts the skid washer and that the keywasher is correctly engaged with the hub.

**C. Tighten HP Turbine Nut (Ref.Fig.521).**

- (1) Prepare the equipment.
  - (a) Attach the lifting ring (Tool 334) to the spanner (Tool 1085) and secure it with bolts.
  - (b) Assemble the hand torque multiplier (Tool 1022) to the immobilizer (Tool 1343) and secure the assembly with bolts, then assemble the adapter (Tool 1315) to the immobilizer and secure it with bolts.
- (2) Assemble equipment and tighten the hub nut.
  - (a) Using a hoist, carefully lower the spanner (Tool 1085) over the shaft and engage it with the hub nut. Remove the hoist and lifting ring from the spanner.
  - (b) Attach a crane hoist to the immobilizer ring, then carefully lower the immobilizer/multiplier over the spanner and guide the turbine securing bolts through the pillar tubes. Turn the square drive of the multiplier (if necessary) until engagement is achieved with the spanner.

**WARNING:** MAINTAIN SUPPORT OF TOOL ASSEMBLY WITH CRANE TO PREVENT ASSEMBLY FROM DROPPING ON TURBINE HUB.

OVERHAUL

- (c) When the immobilizer is engaged in the spanner continue lowering the immobilizer assembly onto the turbine hub and ensure that the Hirth serrations engage correctly.
- (d) Secure the tool assembly to the hub bolts with slave nuts and washers evenly tightened, then remove the crane hoist.
- (e) Use a suitable torque wrench and torque-tighten the hub nut between 3400 and 3700 lbf ft (4610,2 and 5016,9 N.m).

NOTE: The torque multiplier has a ratio of 10 to 1, therefore the input torque must be between 340 and 370 lbf ft (461 and 501,7 N.m).

- (3) Remove the equipment and lock the keywasher.
  - (a) Remove the torque wrench, then attach a hoist to the immobilizer ring. Remove the slave nuts and washers from the turbine hub bolts, then carefully remove the tool assembly and lower onto a container. Disconnect the hoist from the immobilizer.
  - (b) Assemble the lifting ring to the hub spanner, then attach a hoist to the ring and carefully remove the spanner from the drive shaft. Disconnect the hoist from the spanner.
  - (c) Using the peening tool (Tool 274), lock the hub nut keywasher at three equally spaced positions.

## 15. Assemble HP Turbine Rotor and Labyrinths

### A. Assemble Turbine Rotor to Hub (Ref.Fig.522).

- (1) Ensure that the Hirth serrations on the disk face downward.
- (2) With the knurled nuts of the lifting fixture (Tool 1120) in the 'UNLOCK' position, carefully lower the lifting fixture into the centre bore of the disk and engage the support feet under the disk by turning the knurled nuts to the 'LOCK' position.

- (3) Attach a crane hoist to the lifting fixture and carefully raise the rotor. Ensure that all components are clean especially the Hirth serrations on the turbine rotor and hub.
  - (4) Carefully lower the turbine rotor over the LP drive shaft. Ensure that the balance datum marks 0 on the turbine disk and hub align, then lower the disk onto the hoist exercising care to prevent damage to the securing bolt threads. Ensure that the Hirth serrations are correctly and fully engaged.
  - (5) Turn the knurled nuts of the lifting fixture to the 'UNLOCK' position, then remove the lifting fixture from the turbine disk and hoist.
- B. Assemble No.24 and 26 Labyrinth to HP Turbine Disk (Ref.Fig.523).
- (1) With balance datum marks 0 aligned, assemble the labyrinth to the turbine disk, exercising care when lowering the labyrinth over the turbine disk securing bolts.
  - (2) Assemble the immobilizer (Tool 1354) to the CC0C flange positioning the immobilizer to allow the restraining pin to engage with a hole between the bolts protruding through the labyrinth. Secure the tool to the CC0C flange with nuts, bolts and washers.
  - (3) Identify the securing bolt positions 1 to 10 for torque sequence purposes. Apply lubricant 'C' to the nuts, bolts and thrust faces of the nuts, then loosely assemble the nuts (72-51-04/1-120) to the bolts.
  - (4) Using a torque wrench, torque-tighten the nuts to the nut run-down torque plus 30 lbf.in. (3,4 Nm) in the following sequence 1, 6, 3, 8, 2, 7, 4, 9, 5 and 10.
  - (5) On completion of the tightening procedure, carry out a torque locking check.
    - (a) Slacken No.1 nut sufficiently to facilitate the torque locking check.

OVERHAUL

- (b) Tighten the nut and note that the torque resistance is between 24 and 105 lbf in. (2,7 and 11,9 N.m), then torque-tighten to 60 lbf in. (6,8 N.m) in excess of the noted torque to ensure full engagement of the bolt.
  - (c) Repeat the procedure i.e. slacken, then torque check each of the remaining nuts in turn. If any nut is below the minimum torque value, it must be replaced and a torque check carried out to ensure it is within the torque limits.
- (6) On completion of the torque check procedure, tighten and stretch each bolt in the sequence of 1, 6, 3, 8, 2, 7, 4, 9, 5 and 10 in the following manner.
- (a) Place the cranked wrench spanner (Tool 1630) on No.1 nut.
  - (b) Place the checking fixture (Tool 82) in position with the dial indicator stylus located on the end of the bolt. Set the dial indicator to 0.
  - (c) Ensure that the immobilizer is correctly engaged in the disk. Tighten the nut gradually until the dial indicator records a bolt stretch of 0.013 to 0.015 in. (0,33 to 0,36 mm).
  - (d) Repeat the stretching procedure for each bolt in the given sequence.
- (7) Remove the checking fixture and place it into the container. Remove the immobilizer.
- (8) Measure the amount of bolt thread protruding from each nut. To comply with S.B.72-8444-225, thread protrusion must be no less than 0.145 in. (3,683 mm). This is approximately equal to 2.5 threads.
- (a) If the thread protrusion of each bolt is satisfactory remove the immobilizer and proceed with the engine assembly (Ref.para.E.).
  - (b) If the thread protrusion of any bolt is less than the amount detailed remove and replace the deficient bolt(s).
  - (c) Clearly identify the bolt(s) to be replaced.

OVERHAUL

- (b) Hold each segment in position and using a flexible checking gauge or laminated feeler gauge check the gap between the turbine blade edge and the nozzle vane segment. Each gap must be within the dimensions quoted in the Fits and Clearance Schedule (72-00-00) FCS.241.

D. Adjusting Washer Proving Check (Ref.Fig.524).

NOTE: This check does not conform to module interchangeability requirement.

- (1) Obtain dimension (X) from the adjusting washer thickness check (Ref.para.13.C). Record as dimension X for this calculation.
- (2) Measure the distance from the rear flange face of the CCOC to the HP turbine disk at position X. Record as dimension Y for this calculation.
- (3) Prove the adjusting washer thickness and HP turbine set dimension using the following formula.

$$\text{HP turbine set dimension} = X - Y$$

- (4) Acceptance limit for the set dimension must be within the dimensions quoted in the Fits and Clearance Schedule (72-00-00) FCS.237.
- (5) Assemble protector (Tool 1061) to No.24 and 26 labyrinth.

E. HP Turbine Rotor Swash Check (Ref.Fig.524).

NOTE: This check conforms to module interchangeability requirement.

- (1) Check the turbine rotor for swash at dimension X and at 45 deg intervals. Record the total dial indicator reading at each position and note the highest point of variation.
- (2) Obtain the highest point of swash variation from the HP Compressor Sub-assembly records (Ref. 72-33-00 para.6.C).

TN10486

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (3) Compare the highest point of sub-assembly swash variation with the highest point of engine assembly swash variation. The difference must not exceed 0.001 in. (0,0254 mm).

- (4) Investigate and rectify excessive swash variation.

16. Assemble and Secure the LP Turbine Nozzle Assembly to CCOC  
(Ref.Fig.525)

A. Assemble the Nozzle Assembly.

- (1) Ensure that the nozzle assembly multiple leg sling (Tool 1192) is correctly assembled to the nozzle vanes, then attach a hoist to the sling.
- (2) Remove the protector from No.24 and 26 labyrinth and assemble steady (Tool 1013) to the LP drive shaft. Raise and position the nozzle assembly over the LP drive shaft, then align the inspection probe hole in vane No.13 and the thermocouple holes in vanes No.11 and 14 with the ports in the CCOC.
- (3) Lower the nozzle assembly into the recess in the CCOC flange and ensure that it locates correctly.
- (4) Remove the multiple leg sling from the nozzle vane assembly.
  - (a) Unscrew the knurled nut on each retaining hook. Press the hooks downwards, then turn the hooks through 90 deg to disengage them from the vanes.
  - (b) Withdraw each hook as far as possible, then carefully raise the sling from the nozzle vane assembly. Lower the sling onto a suitable container, then disconnect the hoist.
- (5) Attach the multiple leg sling (Tool 1645) to the clamping ring (Tool 1262), then attach a hoist to the sling. Position and lower the clamping ring onto the CCOC rear flange, ensuring that the pin locates correctly. Secure the ring with nuts, bolts and washers.

- (6) Install inspection port flanged sealing bar(s) (72-42-01/2-220).

NOTE: There are two configurations of turbine inspection port access at rear of drains tank position (Ref.Fig.525).

- (a) Apply lubricant 'C' to the securing bolts (72-42-01/2-200).
- (b) Place a gasket (72-42-01/2-225) SB.72-58 over the stem of each flanged sealing bar (72-42-01/2-220).
- (c) Insert the sealing bars into the CCOC, place a cover plate (72-42-01/2-210) on each sealing bar and secure each assembly with two bolts torque-tightened to 100 lbf in. (11,5 N.m). Wire-lock each pair of bolts together.
- (7) Check to ensure that the thermocouple ports are not obstructed.

#### 17. Calculate LP Turbine Adjusting Washer Thickness

NOTE: This procedure is to Pre SB.72-94 standard and does not conform to module interchangeability requirement.

##### A. Adjusting Washer Checks (Ref.Fig.525).

- (1) Lower the checking gauge (Tool 76) into position over the LP drive shaft ensuring that the tool locates correctly on the clamping ring and nozzle vanes.
- (2) Depress the sliding bush in the centre of the tool and ensure that it locates on the adjusting washer abutment face on the LP drive shaft (Ref. detail B).
- (3) Calculate adjusting washer thickness.
- (a) Obtain dimensions D and C ( $D + C = X$ ) from the LP turbine rotor sub-assembly records (Ref. 72-52-02, para.13). Record as dimension X for this calculation.
- (b) Measure the distance from the rear face of the fixed sleeve to the rear face of the sliding bush (Dimension A Fig.525) (4.000 in. (101,600 mm) - Dimension A) = Y. Record dimension Y for this calculation.

ASSEMBLY

72-00-00

Page 563  
Dec 31/01

OLYMPUS 593

MK.610-14-28  
OVERHAUL

(c) Obtain the LP drive shaft/rotor rear end-float dimension from the LP compressor drive shaft sub-assembly records (Ref.72-31-04, para.5.B. (4)). Record as dimension Z for this calculation.

(d) Calculate the required adjustment washer thickness as follows:

Adjustment washer thickness = (X + 0.160 in.  
(4,064 mm)) - (Y + Z).

(3) Select an adjusting washer of the required thickness from the range (72-31-04/2-10 to 105) (72-09-21 Repair, Fig.402) Pre-SB.72-94 and record the thickness of the washer to be installed. Remove the checking gauge and clamping ring from the engine.

#### 18. Assemble LP Turbine Rotor to Engine

##### A. Assemble Turbine Rotor (Ref.Fig.527).

- (1) Place the adjusting washer of the correct calculated size on the LP drive shaft.
- (2) Ensure thorough cleanliness of splines. Apply lubricant 'A' to LP drive shaft splines.
- (3) Ensure that the lifting/extracting fixture (Tool 1142) handle is fully retracted, then carefully screw the cylindrical section of the tool fully onto the LP turbine hub.
- (4) Attach a crane hoist to the lifting fixture, then carefully lift and position the turbine assembly over the LP drive shaft. Align the master splines of the shaft and turbine assembly, then carefully lower the turbine assembly over the shaft.
- (5) Unscrew and remove the lifting/extracting fixture from the turbine assembly, then disconnect the hoist from the fixture.
- (6) Carefully lower the mechanical driver (Tool 1146) over the LP drive shaft, then turn the small handle on the driver and screw the inner part of the driver onto the thread on the end of the LP drive shaft until fully engaged. Screw down on the large handle until the outer part of the driver contacts the LP turbine hub, then tighten the handle until the turbine assembly is pressed fully onto the LP drive shaft and abuts the adjusting washer. Unscrew and remove the mechanical driver from the LP drive shaft.

## B. Assemble Retaining Nuts (Ref.Fig.527).

- (1) Assemble the bearing inner track retaining nut (72-52-02/1-130) to the drive shaft.
  - (a) Apply lubricant 'A' to the nut, then screw the nut onto the drive shaft as far as possible by hand.
  - (b) Align the splines and lower the immobilizer (Tool 862) into the rear end of the drive shaft until the immobilizer abuts the end of the shaft.
  - (c) Lower the spanner wrench (Tool 1616) over the immobilizer and engage it on the bearing retaining nut.
  - (d) Using a crane hoist, lower the torque multiplier (Tool 1647) and engage it with the splines in the immobilizer and spanner turning the multiplier drive (if necessary) to achieve engagement.
  - (e) Engage a torque wrench in the multiplier drive, then torque-tighten the nut between 690 and 790 lbf ft (935,6 and 1071,2 N.m).

**WARNING:** CRANE HOIST MUST SUPPORT GEARBOX  
DURING TORQUE LOADING PROCEDURE.

- (f) Remove the torque wrench, multiplier, spanner and immobilizer from the nut and drive shaft.
- (2) Lower the cupwasher (72-52-02/2-20) over the drive shaft and engage it in the castellations in the bearing inner track retaining nut.
- (3) Assemble the LP turbine retaining nut (72-52-02/2-10) to the drive shaft.
  - (a) Apply lubricant 'A' to the nut, then screw the nut onto the LP drive shaft, as far as possible by hand.
  - (b) Assemble the immobilizer (Tool 862) to the end of the LP drive shaft, ensuring that the splines engage correctly and the immobilizer plate rests on the end of the shaft.

- (c) Lower the wrench spanner (Tool 1578) over the immobilizer and engage it with the LP turbine hub retaining nut.
- (d) Use a crane hoist and position the torque multiplier (Tool 1647) over the assembled tools.
- (e) Lower and engage the multiplier with the splines in the immobilizer and spanner.
- (f) Engage a torque wrench in the multiplier and torque-tighten the nut between 1450 and 1550 lbf ft (1965,9 and 2101,5 N.m). Do not lock the cupwasher until a satisfactory adjusting washer proving check is completed.

**WARNING:** CRANE HOIST MUST SUPPORT TORQUE MULTIPLIER DURING TORQUE LOADING PROCEDURE.

- (g) Remove the wrench, multiplier, spanner and immobilizer from the LP drive shaft.

## C. Adjusting Washer Proving Check (Ref.Fig.528).

**NOTE:** This check does not conform to module interchangeability requirement.

- (1) Measure the distance from the rear face of the LP turbine disk to the CCOC rear flange face. Record as dimension W.
- (2) Obtain the LP shaft/rotor shaft rear end-float dimension from the LP compressor drive shaft sub-assembly records (Ref.72-31-04, para.5.B.(4)). Record as dimension X for this calculation.
- (3) Obtain dimension C from the LP turbine rotor sub-assembly records (Ref.72-52-02, para.13). Record as dimension Y for this calculation.
- (4) Obtain dimension A from the turbine static sub-assembly records (Ref.72-00-51, para.44.B). Record as dimension Z for this calculation.
- (5) Calculate the LP turbine set dimension as follows:  
$$\text{LP turbine set dimension} = (W + X) - (Y + Z) = \text{actual}$$
- (6) Acceptance limit for the set dimension must be between 0.155 in. and 0.165 in. (3,937 and 4,191 mm).

- (7) On completion of a satisfactory adjusting washer proving check, lock the turbine retaining nut cup-washer in three equally spaced positions with peening tool (Tool 274).

D. Assemble LP Drive Shaft Centralizing Fixture (Ref.Fig.528).

- (1) Assemble the immobilizer (Tool 927) to the centralizing fixture (Tool 1261) and secure it with nuts and washers. Ensure that the sliding plates in the immobilizer are fully withdrawn and locked.
- (2) Attach a crane hoist to the immobilizer, then position and carefully lower the assembly over the LP drive shaft and engage the locating pins and studs in the CC0C rear flange. Ensure that the fixture is fully in position on the flange, then secure it with thumbnuts.
- (3) Release and remove the immobilizer from the centralizing fixture, then disconnect the hoist from the immobilizer.

19. Assemble Locking Tube to LP Drive Shaft

A. Prepare to Assemble Locking Tube (Ref.Fig.529).

- (1) Carefully insert the split guide sleeve (Tool 609) into the splined bore of the LP drive shaft.
- (2) Carefully remove the locking tube from the container (Tool 1452) and ensure that it is clean and undamaged.
- (3) Remove the nut, lockwasher, inner guide and washer from the locking tube (if assembled).
- (4) Screw the lifting fixture (Tool 1323) onto the rear end of the locking tube. To assist assembly alignment, note the master spline position at the front end of the tube and identify the rear end accordingly by marking the lifting fixture.
- (5) Ensure that the seal ring assembly is assembled to the rear end of the locking tube, and that the separate sealing ring gaps are not consecutively aligned. Apply lubricant 'A' and ensure that the seal ring assembly is free to move radially in its location groove.

- (6) Align the master splines of the serrated and locking sleeves at the front end of the locking tube by sliding the alignment tool (Tool 611) over the splines of the serrated sleeve then turning the locking sleeve until the tool can be engaged. Withdraw the tool ensuring that the locking sleeve is not turned.
- (7) Attach a crane hoist to the locking tube lifting fixture, then raise and position the tube over the LP drive shaft.

B. Assemble the Locking Tube.

CAUTION: EXERCISE GREAT CARE WHEN LOWERING LOCKING TUBE INTO DRIVE SHAFT. DAMAGE TO DRIVE SHAFT CARBON SEALS COULD OTHERWISE RESULT.

- (1) Position the locking tube so that the master splines of the sleeves are radially aligned with the master spline on the rear end of the LP drive shaft, then carefully lower the locking tube into the shaft until approximately three quarters of its length is inserted.
- (2) Remove the split guide sleeve from the LP drive shaft.
- (3) Ensure that the master spline identification on the lifting fixture is maintained in line with master spline on the rear end of the LP drive shaft, then continue lowering the locking tube until engagement occurs between the master splines of the tube sleeve and the LP drive shaft. If engagement does not occur, turn the locking tube slightly in one direction, then the other (if necessary) until engagement occurs. When engaged, press the tube into the LP drive shaft until the tube rear flange abuts the internal sleeve in the rear end of the LP drive shaft. If full engagement will not occur, the locking sleeve may have turned. Withdraw the locking tube, align the sleeves and reassemble.
- (4) When the locking tube is fully engaged, unscrew and remove the lifting fixture from the locking tube.

## 20. Assemble and Install LP Shaft Signal System Mechanism

### A. Assemble LP Shaft Signal System Mechanism (Ref.Fig.530).

- (1) Assemble the inner guide (72-31-05/1-60) to the helical splined nut (72-31-05/1-50), and by trial and error, ensure that the alignment spot on the front face of each item are in line, when the front faces are level. Assemble the retaining nut (72-31-05/1-70) and keywasher (72-31-05/1-80) to the helical splined nut, then assemble the outer guide (72-31-05/1-90) to the helical splined nut. By trial and error, align the spot on the front face of the outer guide with the spots on inner guide and helical splined nut when the front faces are level.
- (2) Place the adjusting washer (72-31-05/1-100) supplied with the mechanism (Ref.72-31-04, para.6), on the rear of the locking tube.
- (3) Note the alignment spots on the rear face of the locking tube rear splines, then assemble the signal system mechanism to the locking tube ensuring that the alignment spot on the inner guide aligns with the alignment spots on the tube.
- (4) When fully in position on the locking tube, the alignment marks on the side of the inner guide and helical splined nut must coincide. If this alignment is not achieved, remove the mechanism and investigate for cause of error.
- (5) Apply lubricant 'A' to the retaining nut, then ensuring that the keywasher is correctly located, screw the retaining nut onto the LP drive shaft as far as possible by hand.
- (6) Re-check the external alignment marks as detailed in para.(4).

B. Lock LP Shaft Signal System Retaining Nut (Ref.Fig.531).

- (1) Ensure that the sliding plates on the immobilizer (Tool 927) are fully withdrawn and locked, then assemble the immobilizer to the centralizing fixture and secure it with nuts and washers.
- (2) Lift an access plate on the centralizing fixture and carefully rotate the LP drive shaft until the machined recesses on the shaft are in line with the sliding plates, then engage the plates with the machined recesses and lock the plates firmly in position.
- (3) Carefully insert spanner (Tool 929) down through the centre of the immobilizer and engage it with the signal mechanism retaining nut.
- (4) Assemble adapter (Tool 1300) to the hand torque multiplier (Tool 1022) and secure with eight bolts.
- (5) Lower the adapter/multiplier onto the immobilizer and turning the multiplier drive (if necessary), engage the adapter in the immobilizer and the multiplier in the spanner. Torque-tighten the retaining nut to 286 lbf ft (388 N.m).
- (6) Remove the wrench, adapter/multiplier and spanner, then release and remove the immobilizer (Tool 927). Do not remove the centralizing fixture at this stage.
- (7) Lock the retaining nut with the keywasher at three equally spaced positions with the peening tool (Tool 314).

C. Lock the Shaft Signal System Mechanism (Ref.Fig.532).

- (1) Apply lubricant 'A' to the threads of the castellated round nut (72-31-05/1-40), then insert the nut into the shaft signal system mechanism and screw it into the threads on the locking tube (Ref.detail A).
- (2) Torque-tighten the nut to 65 lbf ft (88 N.m) using a torque wrench and spanner (Tool 1617).
- (3) Insert the locking piece (72-31-05/1-30) into the mechanism inner guide engaging the splines and, (by trial and error), engage the lugs on the locking piece with the castellations of the nuts (Ref. detail B). If engagement cannot be achieved, the castellated nut may be turned in increments to a maximum torque-loading of 70 lbf ft (94,9 N.m) until locking piece engagement is achieved.
- (4) Place the keywasher (72-31-05/1-20) in position on the locking piece and ensure that the lugs engage correctly (Ref.detail C).
- (5) Screw the retaining nut (72-31-05/1-10) into position over the keywasher and torque-tighten it to 95 lbf ft (129 N.m) using a torque wrench and spanner (Tool 1513) (Ref.detail D). Lock the retaining nut by peening the keywasher into the nut.

21. Assemble Turbine Exhaust Diffuser to CCOC

A. Prepare for Assembly.

- (1) Remove the centralizing fixture from CCOC.
  - (a) Ensure that the sliding feet of the immobilizer (Tool 927) are fully withdrawn and locked, then assemble the immobilizer to the centralizing fixture and secure it with nuts and washers.

OVERHAUL

- (b) Remove the thumbnuts securing the centralizing fixture to the CCOC. Attach a crane hoist to the immobilizer, then carefully remove the assembly from the engine, lower onto a container and disconnect the hoist. If necessary use protector (Tool 1180) to protect the engine.

B. Assemble Turbine Exhaust Diffuser (Ref.Fig.533-534 and Table 502).

- (1) Assemble the lifting fixture (Tool 305) to the rear centre cone of the turbine exhaust diffuser aligning the captive bolts of the fixture with the anchor nuts of the cone. Secure the fixture by screwing the bolts into the anchor nuts.
- (2) Application of compound (Ref.Fig.533).
  - (a) Ensure thorough cleanliness of all parts. Do not apply jointing compound to bolt threads.
  - (b) Apply a thin coating of jointing compound 'A' to the CCOC and turbine exhaust diffuser abutment flanges and also to the heads and shanks of the retaining bolts held captive in the exhaust diffuser flange.
  - (c) Apply additional jointing compound to the bolts positioned 30 deg each side of the bottom position, and also seal the gaps between the LP turbine nozzle vanes and CCOC flange over the 30 deg areas.
- (3) Attach a crane hoist to the lifting fixture on the exhaust diffuser, then raise and position the assembly over the CCOC.

CAUTION: EXERCISE CARE WHEN LOWERING EXHAUST DIFFUSER. DAMAGE TO LP TURBINE BEARING COULD OTHERWISE RESULT.

- (4) Align the pin hole in the exhaust diffuser flange with the headless pin in the CCOC flange, then carefully lower the exhaust diffuser on to the CCOC guiding the bolts attached to the exhaust diffuser flange into the holes in the CCOC flange.

## (5) Assemble bolts.

- (a) Ensure that all bolts are fully inserted through the flanges.

**CAUTION:** EXERCISE CARE AND ENSURE D HEAD BOLTS FIT TIGHTLY AGAINST LOCATING SHOULDER TO AVOID DAMAGE.

- (b) Remove any jointing compound that extrudes onto the bolt threads and apply lubricant 'A' to the threads.
- (6) Use an approved non permanent marking agent and mark the flange bolt hole positions 1 to 144 in the clockwise direction when viewing from the rear of the engine.

SNECMA

- (b) Insert the spacer (72-53-00/8-250) between the bracket and the engine flange at positions G bolt-hole 138.
  - (c) Ensure bracket at position A is assembled correctly, dependent on which standard of bracket is being assembled (Refer to Fig.543).
- (8) Secure the containment shield to each mounting bracket at position C.
- (a) Apply lubricant 'A' to securing items, then locate each bracket on the grooved pin in the containment shield and insert each retaining plate (72-53-00/3-10) into the respective pin groove.
  - (b) Use bolts (72-53-00/3-50) to secure the mounting brackets positioned at bolt locations (27-28-29) (117-118-119).
  - (c) Secure the bracket and mounting bracket at bolt location (99-100-101) with bolts (72-53-00/3-40).
  - (d) Secure the remaining mounting brackets to the containment shield with bolts (72-53-00/3-60). Ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the bolts to 100 lbf in. (11,5 N.m).

- (9) Ensure that the nuts have a minimum locking (run-down) torque of 6.5 lbf in. (0,73 N.m). Torque-tighten the engine flange and bracket nuts between 170 and 190 lbf in. (19,2 and 21,5 N.m). Torque the remaining flange nuts and bolts to 210 lbf in. 24 N.m) using the cranked ring wrench (Tool 1508) and adapter (Tool 239).
- (10) Allow a period of ten minutes to elapse after torque tightening the engine flange and bracket nuts then torque check the nuts and ensure that torque-tightness as detailed is maintained.
- (11) Assemble eight protectors (Tool 1350) to the exhaust diffuser vane positions.
- (12) Release and remove the lifting fixture, then assemble the protector (Tool 437) to the rear end of the exhaust diffuser.

22. Assemble Rear Cover Unit to CCOC Heat Insulation Shields  
(Ref.Fig.535)

A. Prepare for Assembly.

- (1) Remove the nut and washer from the rear position of the CCOC heat shields joint at the top position on the engine.

CR 33335/00A

OLYMPUS 593

MK.610-14-28

MK.610-14-28  
OVERHAUL

- (2) Apply lubricant 'B' to the nut and bolts.

B. Install Rear Covers.

- (1) Place each rear cover in the respective left or right-hand position on the rear of the CCOC heat shields and overlap at the top position where the nut has been removed from the main heat shields. Loosely retain the covers with the nut and washer.
- (2) Secure the rear covers at the remaining positions with bolts (71-32-01/2-20-50) and washers (71-32-01/2-30-60). Ensure that the nut and bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the nut and bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m).

23. Assemble Main Oil Tank to Engine (Ref.Fig.536)

A. Prepare Oil Tank.

- (1) Apply lubricant 'B' to the securing bolts.
- (2) Assemble the stiffener plate (79-11-01/2-180) to the front of the LP compressor case bracket flange and secure with two shoulder bolts (79-11-01/2-150) and self-locking nuts (79-11-01/2-140).
- (3) Ensure that the nuts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the nuts between 85 and 95 lbf in. (9,6 and 10,7 N.m).

B. Assemble Oil Tank.

- (1) Position the oil tank on the LP compressor case and locate and secure as follows (Ref.Fig.536).
  - (a) Position bracket A so that it locates on the rear face of the LP compressor bracket flange. Secure the bracket temporarily with a bolt (79-11-01/2-170) and a self-locking nut (79-11-01/2-160). Ensure that the nut has a minimum locking (run-down) torque of 6.5 lbf in. (0,73 N.m).
  - (b) Position bracket B so that it locates on the front face of the LP compressor bracket flange. Ensure that the headless pin is fully inserted in the engine flange. Secure the bracket with two bolts (79-11-01/2-70). Ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).

ASSEMBLY

OVERHAUL

- (c) Secure the link C positioned on the front face of the tank to the bracket on the front flange of the LP compressor case. Insert bolt (79-11-01/2-30) through the link and secure with a nut (79-11-01/2-20). Ensure that the nut has a minimum locking (run-down) torque of 6.5 lbf in. (0,73 N.m).
- (d) Check that link C is secured to the tank with a hollow pin (79-11-01/2-50) and bolt (79-11-01/2-40). Ensure that the bolt has a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the bolt between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (2) Torque-tighten the oil tank securing bolts.
- (a) Torque-tighten the bolt at position A between 170 and 190 lbf in. (16,9 and 21,5 N.m).
- (b) Torque-tighten the bolts at position B between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (c) Torque-tighten the nut at position C between 170 and 190 lbf in. (15,8 and 18,1 N.m).
- (3) Check that the clearance gap between the oil tank and engine case or projection on the engine case is not less than 0.120 in. (3,048 mm) at any point.

#### 24. Assemble Pressurising Air Supply Tubes

##### A. Assemble Tube A (Ref.Fig.537).

- (1) Remove blanks (if assembled) from the ends of the tube (75-05-02/1-90), then apply lubricant 'A' to the union nuts.
- (2) Remove the blanking caps from the union locations, then position the tube between the connectors at the right-hand gearbox location and HP compressor case and engage the union nuts. Torque-tighten the union nut at the right-hand gearbox location between 90 and 100 lbf in. (10,2 and 11,3 N.m) using the wrench (Tool 1480), then torque-tighten the union nut at the HP compressor case between 140 and 160 lbf in. (15,8 and 18,1 N.m) using the wrench (Tool 1480). Wire-lock the union nuts.

## B. Assemble Tube B (Ref.Fig.537).

- (1) Remove blanks (if assembled) from the ends of the tube (75-05-02/1-250), then apply lubricant 'A' to the union nuts.
- (2) Remove the blanking caps from the union locations, then position the tube between the connections at the right-hand gearbox location and the intermediate case sump and engage the union nut.
- (3) Assemble the two loop-clamp assemblies (75-05-02/1-180) and the half clamp shells (75-05-02/1-245) (SB.OL.593-75-8972-27 standard) to the tube, then secure the clamps to the two brackets on the exit guide vane case front flange with nuts, bolts and washers (75-05-02/1-190-210-200) having lubricated the nuts with lubricant 'B'. Ensure that the nuts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the nuts between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (4) Torque-tighten both union nuts between 90 and 100 lbf in. (10,2 and 11,3 N.m) using the wrench (Tool 1480), then wire-lock the union nuts.
- (5) Ensure that a minimum clearance of 0.100 in. (2,54 mm) exists between the tube and the right-hand gearbox mounting bracket.

## C. Secure Tube C (Ref.Fig.537).

NOTE: Tube C will have been connected previously (Ref.72-32-00).

- (1) Assemble a self-locking clipnut (75-05-02/1-335) to the bracket nearest the intermediate case sump (Ref.detail D), and lubricate the nut (75-05-02/1-330) with lubricant 'B'. Assemble the two loop-clamp assemblies (75-05-02/1-320) and the half clamp shells (75-05-02/1-385) (SB.OL.593-75-8972-27 standard) to the tube, then secure the clamps to the brackets with bolts and washers (75-05-02/1-350-340), and a nut (75-05-02/1-330) onto the bracket without the clipnut. Ensure that the nut has a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the nut and bolt between 67 and 73 lbf in. (7,6 and 8,2 N.m).

26. Assemble Right-hand Gearbox to Engine

## A. Prepare Brackets and Pins (Ref. Fig.538).

- (1) Locate two nuts (72-31-02/2-100) in the provisioned holes of the nut retainer (72-63-01/1-80). Apply lubricant A to the threads of the stepped threaded pin (72-63-01/1-70), then insert the pin through the end hole of the front mounting bracket (72-63-01/1-110). Position the nut retainer with the previously assembled nuts to its correct position on the front mounting bracket, then secure the retainer with the threaded pin (72-63-01/1-70) and nut (72-63-01/1-60).
- (2) Ensure that the holes in the nut retainer (72-63-01/1-80) align the corresponding holes in the mounting bracket (72-63-01/1-110). Hold the stepped pin (72-63-01/1-70) across the flats, then torque-tighten the pin to 40 lbf in. (4,5 N.m) ensuring that the pin has a minimum run-down (locking torque) of 2 lbf in. (0,23 N.m).
- (3) Using an approved freezing agent, freeze the stepped pin (72-63-01/1-10), then assemble the pin to the front outer flange of the intermediate case at the bottom position, near No.4 vane, ensuring that the smaller diameter of the pin extends towards the rear, and the larger diameter is flush with the front face of the flange.
- (4) Temporarily assemble the front mounting bracket (72-63-01/1-110) to the front flange of the intermediate case and retain it with bolts (72-31-02/2-110) lubricated with lubricant A and nuts (72-31-02/2-100).
- (5) Temporarily assemble the rear mounting bracket (72-63-01/1-240) to the rear flange of the intermediate case and retain it with bolts (72-33-01/6-200) lubricated with lubricant A and nuts (72-33-01/6-190).

OVERHAUL

B. Assemble Lifting Equipment to Right-hand Gearbox  
(Ref.Fig.539).

- (1) Assemble the adapters (Tool 793 and 794) to the lifting fixture (Tool 795) and secure each adapter with two nuts and washers.
- (2) Position the lifting fixture assembly so that an adapter aligns with a lifting point on each side of the gearbox, then secure each adapter with the retaining bolts and ensure that the locking pin in adapter (Tool 793) is fully engaged.
- (3) Assemble the lifting fixture (Tool 798) to the lifting fixture assembly attached to the gearbox.
  - (a) Attach a spring balance weighing scale (400 lb 181,4 kg. dial indicator pattern) to a crane hoist.
  - (b) Attach turnbuckle (Tool 1302) to the weighing scale and carefully attach the turnbuckle to the lifting fixture (Tool 798). Secure it with the knurled pin on the turnbuckle screwed fully into position.
  - (c) Carefully raise the lifting fixture and engage its studs with the slots in the top of the gearbox lifting fixture. Secure the equipment with nuts and washers firmly tightened.
- (4) Remove the bolts and washers securing the engine turning point cover to the gearbox and remove the cover. Carefully remove the blank from the gear shaft on the gearbox.
- (5) Ensure that the six headed pins (72-63-01/1-28) are assembled to the gearbox mounting flange.
- (6) Assemble gasket (72-63-01/10-29) to the gearbox mounting flange. Apply lubricant 'B' to the retaining bolts (72-63-01/10-27).

ASSEMBLY

OVERHAUL

C. Assemble Gearbox to Engine (Ref.Fig.540).

- (1) Carefully raise the gearbox and note the weight of the assembly.

CAUTION: MAINTAIN NOTED WEIGHT OF GEARBOX DURING ASSEMBLY AS SHAFT MUST BE INSERTED HORIZONTALLY INTO ENGINE. DAMAGE TO SHAFT COULD OTHERWISE RESULT.

WARNING: EXERCISE CARE TO PREVENT HANDS BEING TRAPPED BETWEEN LIFTING FIXTURE AND GEARBOX DURING ROTATION OF GEARBOX.

- (2) Remove the locking pin from the adapter (Tool 793), then carefully rotate the gearbox to allow the gear shaft to move downward and through 180 deg in readiness for entry into the engine. Remove the blank from the gear shaft location on the engine.
- (3) Insert the engine hand turning tool (Tool 613) into the engine turning point on the gearbox and connect a wrench to the tool.
- (4) Position the gearbox to allow the gear shaft to enter vane No.3 using the turnbuckle for fine adjustment. Carefully push the gearbox into position and engage the gearbox gear shaft in the engine bevel gear by turning the wrench/tool. When the gear shaft is engaged, push the gearbox into position until the joint faces are in contact. Ensure that the pins enter into the main mounting bracket. Remove the hand turning equipment and loosely assemble the turning location cover.
- (5) Secure gearbox to the gearbox mounting bracket. Assemble nuts (72-63-01/10-26) to the bolts and torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m). Use the swivel wrench (Tool 3132) to run the nuts down prior to torque-tightening.

## D. Determine Shims for Front and Rear Mounting Brackets.

**NOTE :** The shims and plates must be a firm sliding fit.

- (1) Select the correct thickness adjusting plate (72-63-01/1-120-205) (72-09-21 Repair, Fig.435) from the range to accommodate the gap which exists between the front mounting bracket and the gearbox. Record the thickness of the selected adjusting plate.
- (2) Select the correct thickness adjusting shim (72-63-01/1-250-295) (72-09-21 Repair, Fig.437) from the range to accommodate the gap which exists between the rear mounting bracket and gearbox. Record the thickness of the selected adjusting shim.
- (3) Unscrew and remove the nuts and bolts temporarily retaining the front (72-63-01/1-110) and rear (72-63-01/1-240) mounting brackets to the intermediate flange then remove the brackets.
- (4) Apply lubricant A to the locating diameter of the two hollow headed pins (72-63-01/1-100) then locate them in the front mounting bracket and the correct thickness adjusting plate (72-63-01/1-120-205) previously selected. Temporarily assemble the bracket and plate to the gearbox. Apply lubricant A to two bolts (72-63-01/1-90) then secure the pins, bracket and plate, torque-tighten the bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m) ensuring a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).
- (5) Apply lubricant A to the locating diameter of the two hollow headed pins (72-63-01/1-230), then locate them in the rear mounting bracket (72-63-01/1-240) and the correct thickness adjusting shim (72-63-01/1-250-295) previously selected. Finally assemble the pins, bracket and shim to the gearbox and secure with two bolts (72-63-01/1-220) lubricated with lubricant A. Torque-tighten the bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m) ensuring a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).

- (6) Select the correct thickness adjusting plate (72-63-01/1-20-45) (72-09-21 Repair, Fig.434) from the range to accommodate the gap which exists between the front mounting bracket (72-63-01/1-110) and the intermediate case flange. Record the thickness of the selected adjusting plate.
- (7) Select the correct thickness adjusting plate (72-63-01/1-160-205) (72-09-21 Repair, Fig.436) from the range to accommodate the gap which exists between the rear mounting bracket (72-63-01/1-240) and the intermediate case flange. Record the thickness of the selected adjusting plate.

#### E. Finally Assemble Front and Rear Mounting Brackets.

- (1) Finally assemble the rear mounting bracket (72-63-01/1-240) with the correct thickness adjusting plate (72-63-01/1-160-205) previously selected. Secure the plate and bracket to the intermediate flange with bolts (72-33-01/6-200) lubricated with lubricant A and nuts (72-33-01/6-190). Torque-tighten the bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m) ensuring a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).
- (2) Unscrew and remove the bolts and pins securing the front mounting bracket (72-63-01/1-110) to the gearbox, then finally assemble the bracket with its correct thickness adjusting plate (72-63-01/1-20-45) to the intermediate case flange. Secure the bracket and plate with bolts (72-31-12/2-110) lubricated with lubricant A and nuts (72-31-02/2-100). Torque-tighten the bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m) ensuring a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).
- (3) Finally assemble the front mounting bracket (72-63-01/1-110), two pins (72-63-01/1-100) and the correct thickness adjusting plate (72-63-01/1-120-205) to the gearbox. Retain the pins, bracket and plate with bolts (72-63-01/1-90). Torque-tighten the bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m) ensuring a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).

OVERHAUL

F. Check Rotational Movement of HP Rotating Assembly (Ref. Fig.543).

- (1) Assemble the universal joint (Tool 1872) and the adapter (Tool 1876) to the turning location on the right-hand gearbox. Ensure that the assembly pin on the adapter flange locates in the gearbox flange. Secure the assembly with three equally spaced bolts, with lubricant 'A' applied, then torque-tighten the bolts between 90 and 100 lbf in (10,2 and 11,3 N.m).
- (2) Insert the extension bar (Tool 1873) through the adapter and engage it with the universal joint.
- (3) Set the torque wrench (Tool 1874) to between 360 and 400 lbf in. (40 and 45 N.m) and assemble it with the torque adapter (Tool 1875) to the extension bar.

CAUTION: DO NOT EXERT FORCE IN EXCESS OF 400 LBF IN. (45 N.M) OR APPLY SHOCK LOAD.  
FRACTURE OF SHEAR NECK SHAFT IN GEARBOX  
COULD RESULT.

- (4) Apply a gradual force to the torque wrench and check the HP compressor assembly for free and even rotation.
- (5) Investigate and rectify restricted or uneven rotational movement.
- (6) On completion of satisfactory rotational check, remove the hand turning equipment. Ensure that the gasket is in position on the gearbox and loosely assemble the cover.
- (7) Remove the gearbox lifting equipment and assemble a suitable protector to the gearbox.

27. DELETED.

## 28. Assemble Left-hand Gearbox to Engine

### A. Prepare Brackets and Pins (Ref. Fig.541).

- (1) Assemble a hollow pin (72-62-01/8-8B) (SB.72-103) or a solid pin (72-61-01/8-8A) and retaining ring (72-62-01/8-7) (Pre SB.72-103) to the front mounting bracket location on the gearbox. Assemble the front mounting bracket (72-62-01/1-310) over the pin, then temporarily assemble the retaining plate (72-62-01/1-375) (SB.72-103 only) and two bolts (72-62-01/1-300) to align the bracket. Do not screw the bolts fully in, allowing the bracket to be adjusted for the insertion of shims.
- (2) Assemble a hollow pin (72-62-01/8-4B) (SB.72-103) or a solid pin (72-62-01/8-4A) and retaining ring (72-62-01/8-3) (Pre SB.72-103). Assemble the rear mounting bracket (72-62-01/1-130) over the pin, then temporarily retain the bracket with three bolts (72-62-01/1-100, 110 and 120). Do not screw the bolts fully in, allowing the bracket to be adjusted for the insertion of shims.

NOTE: If required, remove the hollow pin (72-62-01/8-8B) using the mechanical puller (Tool 957) and to remove hollow pin (72-62-01/8-4B) use the mechanical puller (Tool 958).

**B. Assemble Lifting Equipment to Left-Hand Gearbox (Ref.Fig.542).**

- (1) Attach a spring balance weighing scale (400 lb 881,8 kg. dial indicator pattern) to a crane hoist. Attach turnbuckle (Tool 1302) to the weighing scale, then carefully attach the turnbuckle to the gearbox lifting fixture (Tool 197) and secure it with the knurled pin on the turnbuckle.
- (2) Remove the gearbox attachment from the end of the lifting fixture by unscrewing the pin securing it to the fixture.
- (3) Remove the protection blank from the fuel control unit location on the gearbox, then carefully place the attachment section removed from the lifting fixture in position on the gearbox. Engage the coupling ring on the gearbox with the attachment section ensuring that it is correctly engaged and tight.
- (4) Secure the lifting fixture to the attachment section and secure it with the pin previously removed.

**C. Assemble Gearbox to Engine (Ref.Fig.542).**

- (1) Remove the protection blanks from the shaft location on the gearbox and vane No.5 location on the intermediate case.
- (2) Examine the driving shaft (72-62-02/1-180) for cleanliness and ensure that the retaining ring (72-62-02/1-190) is assembled to it. Apply lubricant A to splines and insert the retaining ring end of the driving shaft into the gearbox. Assemble the gasket (72-32-00/7-130) to the adapter plate (72-31-00/7-270).
- (3) Insert the engine hand turning tool (Tool 613) into the engine turning point on the right-hand gearbox and connect a wrench to the tool.

**CAUTION:** DO NOT APPLY FORCE IN EXCESS OF 400 LBF IN. (45 N.M.). FRACTURE OF SHEAR NECK SHAFT COULD RESULT.

ASSEMBLY

- (4) Carefully raise the gearbox and note the weight of the assembly.

**CAUTION:** MAINTAIN NOTED WEIGHT OF GEARBOX DURING ASSEMBLY AS SHAFT MUST BE INSERTED HORIZONTALLY INTO ENGINE. DAMAGE TO SHAFT COULD OTHERWISE RESULT.

- (5) Position the gearbox to allow the gear shaft to enter vane No.5 using the turnbuckle for fine adjustment. Carefully push the gearbox into position and engage the gearbox gear shaft in the engine bevel gear by turning the wrench/tool in the right-hand gearbox. When the gear shaft is engaged, push the gearbox into position at the same time ensure that the bolt-holes in the gearbox flange align correctly with, and pass centrally over the 15 bolts protruding from the adapter plate so that the flanges abut squarely.
- (6) Remove the hand turning equipment and loosely assemble the turning point cover.
- (7) Secure the gearbox to the main mounting bracket with load spreading washers (72-32-00/7-20) and nuts (72-32-00/7-10) lubricated with lubricant 'A'. Tighten the nuts but do not torque-tighten at this stage.

**D. Determine Shims for Front and Rear Mounting Brackets**

**NOTE:** The shims must be a firm sliding fit. If working to Pre SB.72-103 standard the gearbox may be withdrawn sufficiently during the procedure, gaining access to facilitate shimming.

- (1) Select the correct thickness adjusting shim (72-62-01/1-220-275) (72-09-21 Repair, Fig.428) from the range to accommodate the gap which exists between the mounting bracket (72-62-01/1-310) and the intermediate case flange. Record the thickness of the selected adjusting shim.
- (2) Select the correct thickness adjusting shim (72-62-01/1-10-65) (72-09-21 Repair, Fig.426) from the range to accommodate the gap which exists between the rear mounting bracket (72-62-01/1-130) and the intermediate case flange. Record the thickness of the selected adjusting shim.

- (3) Disassemble the bolts and the hollow pin retaining plate from the rear mounting bracket, then withdraw the hollow pin from the gearbox using the mechanical puller (Tool 957).
- (4) Disassemble the bolts and the hollow pin retaining plate from the rear mounting bracket, then withdraw the hollow pin from the gearbox using the mechanical puller (Tool 958). Allow the large diameter bolt to remain located in the bracket for ease of assembly.
- (5) Finally assemble the front mounting bracket (72-62-01/1-310) with the two hollow pins (72-62-01/1-290) and the correct thickness adjusting shim (72-62-01/1-220-275) previously determined to the intermediate case flange. Apply lubricant A to the threads of two bolts (72-31-02/2-110) then secure the bracket and shim with the bolts and nuts (72-31-02/2-100). Torque-tighten the bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m) ensuring a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).
- (6) Finally assemble the rear mounting bracket (72-62-01/1-130) with the correct thickness adjusting shim (72-62-01/1-10-65) to the intermediate case flange. Secure the bracket and shim to the flange with bolts (72-33-01/6-330 and 320) lubricated with lubricant A and nuts (72-33-01/6-290). Torque-tighten the bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m) ensuring a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).
- (7) Select the correct thickness adjusting shim (72-62-01/1-320-355) (72-09-21 Repair, Fig.429) from the range to accommodate the gap which exists between the front mounting bracket (72-62-01/1-310) and the gearbox. Record the thickness of the adjusting shim.
- (8) Select the correct thickness adjusting shim (72-62-01/1-140-185) (72-09-21 Repair, Fig.427) to accommodate the gap which exists between the rear mounting bracket (72-62-01/1-130) and gearbox. Record the thickness of the adjusting shim.

ASSEMBLY

OVERHAUL

- (9) Finally assemble the correct thickness adjusting shim (72-62-01/1-320-355) between the front mounting bracket (72-62-01/1-310) and the gearbox. Assemble the hollow pin (72-62-01/8-8B) (SB.72-103) through the mounting bracket and adjusting shim to locate in the gearbox. Secure the bracket, shim and hollow pin with a retaining plate (72-62-01/1-375) and two bolts (72-62-01/1-300). Torque-tighten the two bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m) ensuring a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).
- (10) Finally assemble the correct thickness adjusting shim (72-62-01/1-140-185) between the rear mounting bracket (72-62-01/1-130) and the gearbox. Assemble the hollow pin (72-62-01/8-4B) (SB.72-103) through the mounting bracket and adjusting shim to locate in the gearbox. Secure the bracket shim and hollow pin with a retaining plate (72-62-01/1-205) (SB.72-103) and bolts (72-62-01/1-110 and 1-120). Push the large bolt (72-62-01/1-100) fully home then assemble the load spreading block (72-62-01/1-90) to the bolt and secure with the nut (72-62-01/1-80).
- (11) Torque-tighten bolts (72-62-01/1-110 and 120) between 67 and 73 lbf in. (7,6 and 8,2 N.m) ensuring a minimum run-down (locking torque) of 3.5 lbf in. (0,4 N.m). Torque-tighten the larger bolt (72-62-01/1-100) between 240 and 260 lbf in. (27,1 and 29,4 N.m) ensuring that the nut has a minimum locking (run-down) torque of 9.5 lbf in. (1,1 N.m).

#### E. Finally Secure Gearbox to Engine.

- (1) Ensure that the nuts securing the main mounting bracket have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the nuts between 67 and 73 lbf in. (7,6 and 8,2 N.m). Use a torque wrench in conjunction with cranked ring wrench (Tool 1530).

F. Check Rotational Movement of HP Rotating Assembly  
(Ref. Fig. 543).

- (1) Assemble the universal joint (Tool 1872) and the adapter (Tool 1876) to the turning location on the right-hand gearbox. Ensure that the assembly pin on the adapter flange locates in the gearbox flange. Secure the assembly with three equally spaced bolts, with lubricant 'A' applied, then torque-tighten the bolts between 90 and 100 lbf in. (10,2 and 11,3 N.m).
- (2) Insert the extension bar (Tool 1873) through the adapter and engage it with the universal joint.
- (3) Set the torque wrench (Tool 1874) to between 360 and 400 lbf in. (40 and 45 N.m) and assemble it with the torque adapter (Tool 1875) to the extension bar.

**CAUTION:** DO NOT EXERT FORCE IN EXCESS OF 400 LBF IN. (45 N.M) OR APPLY SHOCK LOAD. FRACTURE OF SHEAR NECK SHAFT IN GEARBOX COULD RESULT.

- (4) Apply a gradual force to the torque wrench and check the HP compressor assembly for free and even rotation.
- (5) Investigate and rectify restricted or uneven rotational movement.
- (6) On completion of satisfactory rotational check, remove the hand turning equipment.
- (7) Apply lubricant 'A' to the cover bolts. Ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Assemble the gasket (72-63-01/4-80) and cover (72-63-01/4-70) to the right-hand gearbox, then secure the cover with seven load spreading washers and seven bolts (72-63-01/4-60 and 50). Torque-tighten the bolts between 90 and 100 lbf in. (10,2 and 11,3 N.m).
- (8) Remove the lifting equipment from the left-hand gearbox and assemble protector (Tool 222) to the gearbox.

Engine Hand Turning Equipment  
Figure 543

OLYMPUS 593

MK.610-14-28  
OVERHAUL29. Check Rotational Movement of LP Rotating Assembly

## A. Assemble Hand Turning Equipment to Intermediate Case Sump (Ref.Fig.543).

- (1) Remove the bolts securing the cover to the intermediate case sump (between the gearbox cases) and remove the cover.
- (2) Assemble the universal joint (Tool 1872) and adapter (Tool 1876) to the sump. Ensure that the assembly pin on the adapter flange locates in the sump flange. Secure the assembly with three equally spaced bolts, with lubricant 'A' applied, then torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (3) Insert the extension bar (Tool 1873) through the adapter and engage it with the universal joint.

## B. Check Rotation of LP Assembly.

- (1) Set the torque wrench (Tool 1877) to between 150 and 180 lbf in. (16,9 and 20,3 N.m) and assemble it with the torque adapter (Tool 1875) to the installed extension bar.

CAUTION: DO NOT EXERT FORCE IN EXCESS OF 180 LBF IN. (20,3 N.M) OR APPLY SHOCK LOAD. FRACTURE OF SHEAR NECK SHAFT IN INTERMEDIATE CASE SUMP COULD RESULT.

- (2) Apply a gradual force to the torque wrench and check the LP compressor assembly for free and even rotation.
- (3) Investigate and rectify restricted or uneven rotational movement.
- (4) On completion of satisfactory rotational check, remove the hand turning equipment.
- (5) Assemble cover to the intermediate case sump.

NOTE: This operation may be carried out in conjunction with assembly of the LP pulse probe to the drive housing (Ref. Para.30.A).

ASSEMBLY

72-00-00

Page 598.11

Jun 1/99

- (6) Apply lubricant 'A' to the cover bolts. Assemble and secure the gasket (72-64-00/1-25) and cover (72-64-00/1-20) to the sump with the seven bolts (72-64-00/1-10). Ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m).

30. Assemble LP Pulse Probe, Oil Pressure Transmitter and Switch to Drive Housing (Ref. Fig.544)

A. Assemble LP Pulse Probe to Drive Housing (Ref. Fig.544).

NOTE: Before assembling the LP pulse probe, refer to SB.76-9 and SB.76-11.

- (1) Remove the pulse probe (76-12-01/1-10) from its protective container, check that the probe is not damaged. Assemble the probe and Corruplus seal (76-12-01/1-40) to the uppermost face of the drive housing (72-64-00/1-90), then secure the probe with eight bolts (76-12-01/1-20) lubricate with lubricant 'A'. Torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).
- (2) Ensure that the gap between the pulse probe and the splines of the drive shaft is between 0.010 and 0.020 in. (0,254 and 0,508 mm).

NOTE: Before assembling the drive housing cover refer to SB.72-41.

- (3) Assemble the drive housing cover (72-64-00/1-20) and gasket (72-64-00/1-25) to the drive housing and secure with seven bolts (72-64-00/1-10) lubricated with lubricant 'A'. Torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).

OVERHAUL

B. Assemble the Oil Pressure Transmitter to Drive Housing (Sump Case) (Ref. Fig.544).

- (1) Ensure that the transmitter flange face is clean and undamaged. Assemble two seals (79-33-01/1-70 and 79-33-01/1-80) to the oil pressure transmitter flange 79-33-01/1-10), then assemble the transmitter to the drive housing. Lubricate seven bolts (79-33-01/1-20) with lubricant 'A', then secure the transmitter with the bolts. Torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).

C. Assemble the Oil Pressure Switch to Drive Housing (Ref. Fig.544).

- (1) Ensure that the flange of the pressure switch 79-33-02/1-10) is clean and free from damage, then assemble two seals (79-33-02/1-70 and 79-33-02/1-80) to the switch flange. Lubricate seven bolts (79-33-02/1-20) with lubricant 'A', then secure the switch, together with a bracket. Torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).

### 31. External Examination of Engine

A. Examination Procedure.

- (1) Ensure that all components assembled to the external surface of the engine are correctly secured. Examine all locking devices for correct locking and security.
- (2) Remove non-permanent identification markings (i.e. bolt position numbers on engine flanges).
- (3) Ensure that all protection blanks are correctly assembled to the engine.
- (4) Verify that all assembly operations and dimensional checks have been completed and recorded where applicable on the appropriate record sheets.
- (5) Ensure that all module identification plates are correctly assembled to the module plate mounting brackets (Ref. Fig.508).

Jun 1/98

**OLYMPUS 593**

MK.610-14-28

OVERHAUL

**TURBINE STATIC - SUB-ASSEMBLY****1. General**

- A. Prior to commencing assembly, refer to 72-09-00, Assembly for general information.
- B. Throughout the text special tools are quoted by their Ref. No. e.g. (Tool 1234). For a complete list of tooling required for the assembly, and for the manufacturer's Part No., refer to Special Tools, Fixtures and Equipment Table 1002.
- C. During the sub-assembly procedure reference will be made to the Illustrated Parts Catalogue (IPC) to identify those items where the nomenclature does not positively identify them, due to duplication of the title e.g. nuts, bolts, washers, bearings, gears, housings, tubes, etc. Where the item is a part of the text concerned, the item will be identified as e.g. bolt (1-10), the 1 referring to the IPC Fig.No. and the 10 referring to the Item No. Where items from a different breakdown are introduced, then the breakdown number will be quoted in addition e.g. bolt (72-32-01/1-10).
- D. During the sub-assembly procedure, where the thickness of adjusting washers has to be determined, the words 'select' or 'select from the range' are used. If a range of washers is not available, it may be necessary to machine the washer to achieve the desired thickness. The information for machining washers is given under chapter 72-09-21 Repair. During the assembly procedure, the machining procedure reference will be given immediately after each adjusting washer I.P.C. Ref. No. in the appropriate part of the text e.g. select from the range the correct thickness adjusting washer (3-70) (72-09-21 Repair, Fig.401).
- E. The turbine static sub-assembly is basically composed of the HP compressor diffuser case and combustion chamber outer case (CCOC) assembled together by means of a bolted flange. Each case contains a series of components most of which are installed before the cases are assembled together. Two assembly stands are used with other tools and equipment. Assembled internally to the diffuser case is the HP turbine bearing support, roller bearing assembly (less inner track) and associated lubrication, venting and air cooling components. Externally the main fuel sprayers are secured to the case. The combustion chamber and HP turbine nozzle vanes are assembled together and installed as a unit in the CCOC. Externally the pilot

SUB-ASSEMBLY

**72-00-51**

Page 501

**OLYMPUS 593**

MK.610-14-28

sneema

OVERHAUL

fuel sprayers and engine igniter plugs are secured to the case. Heat insulation shields are assembled externally to the CCOC in the final stages of assembly. Housed within the complete sub-assembly are labyrinth seals No.12 to 23, No.12 being located within the diffuser case. On completion of assembly the sub-assembly is conveyed on a pallet to the engine assembly area.

NOTE: Rationalisation of operator build sequence for the HP Compressor Diffuser Case and the CCOC sometimes results in a build sequence which may vary from the Overhaul Manual sequence. In all such cases, the overriding requirement on completion of assembly must be compliance with Para.45A Final Examination.

## 2. HP Compressor Diffuser Case Assembly

### A. Assemble Diffuser Case to Assembly Stand (Ref.Fig.501).

- (1) Adjust the assembly stand (Tool 1160) to position the mounting plate (Tool 99) at its lowest point in the horizontal position. Ensure that the lever clamps on the mounting plate are retracted clear of the machined recess.
- (2) Assemble the multiple leg sling (Tool 1191) to the diffuser case and attach to the overhead crane. Manipulate the diffuser case into position on the adapter ensuring that the diffuser case flange is correctly located into the adapter recess. Secure the diffuser case to the adapter by operating the lever clamps. Detach the crane from the sling and remove the sling from the diffuser case.

### B. Install Stepped Pins in Fuel Sprayer Pads (Ref.Fig.501).

- (1) Ensure that the pin locations are undamaged. Freeze shrink the pins (72-34-00/3-10) using a suitable freezing substance. Insert the pins into the sprayer pads.

SUB-ASSEMBLY

**72-00-51**

Page 502

Jun 1/98

OLYMPUS 593

MK.610-14-28

snecma

OVERHAUL

- (2) Assemble sprayer bosses if previously removed (applicable to case Pt. Nos. B925231 and B934987 with bolt-on sprayer bosses only).
  - (a) Identify the sprayer boss (matched part) with its position on the case.
  - (b) Apply lubricant A to threads of the countersunk screws.
  - (c) Apply jointing compound A between the sprayer boss and the case, and under the heads of the countersunk screws.
  - (d) Assemble the sprayer boss to its location on the case and secure with two countersunk screws and nut plate. Tighten the two countersunk screws and ensure that the screwheads do not protrude above the surface of the boss. Peen the heads of the two countersunk screws using a centre-punch.
  - (e) Ensure the pin locations are undamaged. Freeze shrink the stepped pins (72-34-00/3-10) using a suitable freezing substance. Insert the stepped pins into the sprayer bosses.

C. Assemble Shoulder Bolts to Diffuser Case (Ref.Fig.501).

- (1) Insert four shoulder bolts (72-34-00/2-360) through the outer of the two flanges located in the centre area of the diffuser case, ensuring that boltheads are positioned on the bottom face of the flange. Each bolt-hole is identified by two countersunk holes in the top face of the flange.
  - (a) Ensure that the boltheads are fully in contact with the bottom face of the flange, no gap is permissible at any point between the faces.

SUB-ASSEMBLY

**72-00-51**

Page 502A

Jun 1/98

OLYMPUS 593

MK.610-14-28  
OVERHAUL

sneema

- (2) Apply lubricant A to the screws. Secure each bolt with a countersunk screw (72-34-00/2-350) and self-locking nut (72-34-00/2-340), using the special screwdriver (Tool 1626) to tighten the screws. Blank the unused countersunk hole near each shouldered bolt with a countersunk screw and self-locking nut.
- (3) Ensure that the countersunk screws do not protrude above the surface of the flange.
- (4) Ensure that the nuts have a minimum locking (run-down) torque of 6 lbf in. (0,68 N.m). Torque-tighten the nuts to 26 lbf in. (2,9 N.m). Recheck for absence of gap between boltheads and bottom face of flange.

### 3. Prepare the HP Turbine Bearing Support For Assembly

#### A. Assemble Pins and Bolts (Ref.Fig.502).

- (1) Place the bearing support into its support stand (Tool 95).
- (2) Assemble the 58 bolts (72-51-01/5-70) to the rear outer flange section of the bearing support ensuring that the bolts protrude rearward through the flange. Using the sleeve (Tool 1663), assemble a retaining ring (72-51-01/5-60) to each bolt.
- (3) Assemble the pins to the bearing support.
  - (a) Shrink the pins by freezing. Insert the six shouldered pins (72-51-01/5-35) into the rear outer flange of the bearing support.
  - (b) Insert the four locating pins (72-51-01/4-420) into the rear inner flange of the bearing support.
  - (c) Insert a pin (72-51-01/5-30) into the front flange of the bearing support.

#### 4. Temporarily Assemble HP Turbine Bearing Unit to Bearing Housing (Ref.Fig.503)

##### A. Prepare to Assemble Bearing.

- (1) Place the bearing housing on a clean flat surface with the oil connections facing downward.
- (2) If the roller bearing (72-33-02/3-120) is new, remove the protective wrapping and protective grease from the bearing (Ref.72-09-00 Assembly).

NOTE: On engines to SB.0L.593-72-9066-439, the bearing outer race cage and roller (72-33-02/3-121/3-123) and the bearing inner race (72-33-02/3-122/3-124) are separate spareable items. Therefore a mixed new/not new assembly maybe used.

- (3) If the bearing (72-33-02/3-120) is not new assemble the rollers cage and outer track.

NOTE 1: The following procedure should be done in an approved clean room.

NOTE 2: On engines to SB.0L.593-72-9066-439, the bearing outer race cage and roller (72-33-02/3-121/3-123) and the bearing inner race (72-33-02/3-122/3-124) are separate spareable items. Therefore a mixed new/not new assembly maybe used.

- (a) Position the cage in the outer track, then using finger pressure carefully insert each roller into the cage. Check the rollers for free rotation.
- (4) Place a 0.002 or 0.003 in. (0,050 or 0,076 mm) feeler gauge strip around the outer diameter of the roller bearing assembly. The feeler gauge strip must be no wider than the roller bearings and is used to centralize the bearing assembly in the bearing housing.

NOTE: An alternative method of centralizing the bearing is to temporarily insert four 0.002 - 0.003 in. (0,050 - 0,076 mm) feeler gauges, equi-spaced around the outer diameter of the roller bearing assembly.

## B. Assemble Bearing to Housing.

NOTE: Dimensional check is not necessary if the bearing housing (72-51-01/4-300 to 330), retaining ring (72-51-01/4-340 to 370) and bearing (72-33-02/3-120B) are supplied as matched components through SB.72-17. Ensure that these components are retained as matched items.

- (1) Slide the bearing and centralizing strip into the housing ensuring that the castellations engage fully.

NOTE: It is permissible to temporarily insert four equally disposed feeler gauges in lieu of the centralizing strip. Refer para.4A(4) note.

- (2) On engines to Pre SB.72-17 standard carry out the dimensional checks to determine the retaining ring thickness (Ref.Fig.503).
  - (a) Measure and record dimension A.
  - (b) Measure and record dimension B.
  - (c) The required retaining ring thickness dimension  $C = (A - B) + 0.001 \text{ in. (0,025 mm)}$ .

MK.610-14-28  
OVERHAUL *sneema*

- (3) On engines to Pre SB.72-17 standard select a retaining ring from the range (72-51-01/4-340 to 370) (72-09-21 Repair, Fig.416) to suit the dimension C requirement. On engines to SB.72-17 standard ensure that the retaining ring and housing are retained as matched components.
- (4) Apply lubricant 'A' to the eight bolts(72-51-01/4-240). Place the retaining ring in position on the bearing assembly ensuring that the oil jet hole in the retaining ring aligns with the hole in the bearing housing. Secure the retaining ring with the eight bolts.

## 5. Assemble Bearing Housing to Bearing Support (Ref.Fig.504)

### A. Prepare for Assembly.

- (1) Place the bearing support into an oven and heat to a temperature of 120 deg C.
- (2) Place the support stand (Tool 95) in an accessible position in the vicinity of the oven. On completion of the given heating time, remove the bearing support from the oven and carefully place it in the support stand. Wear suitable protective gloves when handling the heated component.

### B. Assemble Bearing Housing.

- (1) Assemble the bearing housing unit to the rear flange of the bearing support. Press the unit fully into position ensuring that the pins engage correctly.
- (2) Apply lubricant A to the bolts (72-51-01/4-290) and spacers (72-51-01/4-280). Insert the bolts through the bearing support flange and bearing housing and screw the nuts (72-51-01/4-270) onto the bolts.

NOTE: Lubricant must be applied to bolt threads also under the boltheads and to the ends of spacers.

- (3) Using the immobilizers (Tool 841 and Tool 842) to hold the nuts, ensure that the bolts have a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m) then torque-tighten the bolts to 100 lbf in. (11,5 N.m).
- (4) Ensure that the bearing housing is fully in position in the bearing support. Use a 0.001 in. (0,025 mm) feeler gauge to check the assembly.

7. Assemble Front Cover Unit to Bearing Support (Ref.Fig.505)

A. Prepare Front Cover Unit.

- (1) Place the insulation blanket sections (72-51-01/4-10A-20A) Pre-SB.72-20 or (72-51-01/4-20B) SB.72-20 in position on the front cover and note the hole positions for the seven D-head bolts (72-51-01/4-60 (Ref.Fig.505 view A).
- (2) Remove the insulation blanket sections and insert the seven bolts into position on the front cover flange. Ensure that the flat section of each bolt is correctly positioned and that the retaining ring groove of each bolt is located on the rear face of the front cover (Ref.Fig.505 view A).
- (3) Secure each bolt with a retaining ring (72-51-01/4-50) assembled by using assembly sleeve (Tool 1321).

B. Assemble Drain Tube to Screwed Connector (Ref.SB.72-84) (Ref.Fig.505).

- (1) Assemble the screwed connector (72-51-01/4-150) to the vice holder (Tool 968) and secure with the special washers and thumbnuts.
- (2) Clamp the vice holder in a bench vice.

Printed in England

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (3) Apply lubricant 'A' to the threads and engage the drain tube union nut (72-34-00/1-420) with the screwed connector.
- (4) Using spanner (Tool 1181) torque-tighten the drain tube union to 125 lbf in. (14 N.m).
- (5) Assemble the insulation top and bottom halves (72-34-00/1-440-450) to the drain tube and secure with clips (72-34-00/1-430).
- (6) Remove the assembly from the vice holder. Secure the special washers and thumbnuts to the vice holder and remove from the bench vice.

C. Assemble Screwed Connector to Cover (Ref.Fig.505).

- (1) Place the screwed connector drain tube assembly flange in position on the front of the cover unit flange.
- (2) Insert bolt (72-51-01/4-120) and bolt (72-51-01/4-130 or 140) through the screwed connector flange and cover unit flange ensuring that the flat edge of each bolt abuts with the raised sections of the screwed connector flange.

NOTE: For conditions attached to the alternative use of bolt (72-51-01/4-130 or 140) refer to the IPC.

- (3) Secure each bolt with a retaining ring (72-51-01/4-110) assembled by assembly sleeve (Tool 1321).
- (4) Select a section of locking wire approximately 18.0 in. (457,2 mm) long.
- (5) Thread half of the locking wire length through the locking hole in the screwed connector, and carefully wind the doubled wire strand around the drains tube in readiness for use at a later stage.
- (6) Using adhesive tape, lightly secure the ends of the locking wire to the drains tube.

D. Assemble Insulation Blanket to Cover Unit (Ref.Fig.505).

- (1) Insert fifteen bolts (72-51-01/4-90) through the remaining holes in the front cover unit flange (Ref. Fig.505 view A). Secure each bolt with a retaining ring (72-51-01/4-80) assembled by using assembly sleeve (Tool 1321).
- (2) Assemble the small and large section of the insulating blanket (72-51-01/4-10 and 20A) Pre-SB.72-20 or (72-51-01/4-20B) SB.72-20 to the front cover unit.
- (3) Apply lubricant 'A' to bolt threads and secure the blanket assembly to the front cover with seven nuts (72-51-01/4-30). Ensure that the nuts have a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m). Torque-tighten the nuts to 100 lbf in. (11,5 N.m).
- (4) Wire-lock the front cover insulation blanket sections together.
- (5) Assemble the insulation blanket sections to the twin air duct connections on the front cover. Wire-lock the sections together.

E. Assemble Front Cover Unit (Ref.Fig.505).

- (1) Insert the oil transfer tube (72-51-01/4-200) into the hole in the front cover unit flange located at the screwed connector position. Note the position of the transfer tube hole in the rear flange of the bearing support located near the bottom position.
- (2) Position the front cover inside the bearing support and over the bearing housing. Engage the transfer tube with the hole in bearing support flange.
- (3) Apply lubricant 'A' to the threads of countersunk screws (72-51-01/4-170).
- (4) Secure the front cover unit to the bearing support with three countersunk screws and self-locking nuts (72-51-01/4-160) inserting the screws through the rear face of the bearing support flange (Ref.Fig.505 view B).
- (5) Ensure that the nuts have a minimum locking (run-down) torque of 6 lbf in. (0,68 N.m). Torque-tighten the nuts to 26 lbf in. (2,9 N.m).

SUB-ASSEMBLY

**72-00-51**

Page 513

Oct 1/82

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

8. Assemble Tube Fittings to Front Cover Unit (Ref.Fig.506)

A. Assemble Adapter Tube.

- (1) Assemble the adapter tube (72-51-01/3-240) to the raised flange positioned near the drains tube and secure it with two bolts (72-51-01/3-230) lubricated with lubricant 'A'.
- (2) Torque-tighten the bolts to 100 lbf in. (11,5 N.m), then wire-lock the bolts together.

B. Seal Ring Gap Checks.

- (1) Ensure thorough cleanliness of all components.
- (2) Select two seal ring assemblies (72-51-01/3-200-250). Carefully insert each ring (72-51-01/3-200) separately into the oil feed bore in the bearing housing. Ensure that the seal ring is installed evenly.
- (3) Measure and record the gap between the seal ring ends of each ring and check that the clearances obtained are within the limits quoted in Fits and Clearances Schedule (72-51-01 F.C.S.244).
- (4) Identify the ring assembly in preparation for assembly to the oil feed tube end assembly.
- (5) Carefully insert each ring (75-51-01/3-250) separately into the oil scavenge bore in the bearing housing. Ensure that the seal ring is installed evenly.
- (6) Repeat the seal ring gap check and check that the clearances obtained are within the limits quoted in Fits and Clearances Schedule (72-51-01 F.C.S.244).
- (7) Identify the ring assembly in preparation for assembly to the oil scavenge tube end assembly.

C. Assemble Oil Scavenge Tube End Assembly to Bearing Housing.

- (1) Ensure that the spherical joint of the tube end assembly (72-51-01/3-260) is damage free. Assemble the seal ring assembly (72-51-01/3-250) to the grooved recess in the castellated union nut. The small diameter sealing ring is assembled between the two larger rings.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (2) Ensure that the open section of each ring is not aligned with the open section of an adjacent ring. Apply lubricant 'A' to the union nut thread and screw the tube end assembly union into position near the bottom location of the bearing housing. Using spanner (Tool 1598) lightly tighten union nut.

D. Assemble Oil Lubricating Nozzle and Tube End Assembly to the Bearing Housing.

- (1) Ensure that the spherical joint of the tube end assembly (72-51-01/3-210) is damage free. Assemble the seal ring assembly (72-51-01/3-200) to the grooved recess in the castellated union nut. The small diameter seal ring is assembled between the two larger rings.
- (2) Ensure that the open section of each ring is not aligned with the open section of an adjacent ring.
- (3) On engines to SB.72-1 or SB.72-39 standard apply lubricant 'A' to the oil lubricating nozzle (72-51-01/3-220A or 220B). Assemble the nozzle to the tube end assembly (72-51-01/3-210B) SB.72-1 and torque-tighten the nozzle to 50 lbf in. maximum (5,6 N.m) maximum.
- (4) On engines to Pre-SB.72-1 or SB.72-8800-311 standard insert the filter assembly (72-51-01/3-215A or 215B) into the tube end assembly (72-51-01/3-210A or 210C). Apply lubricant 'A' to the tube end assembly union nut thread. Ensure that the filter is in position then screw the tube end assembly into the front cover. Lightly tighten the union nut with spanner (Tool 1598).
- (5) On engines to SB.72-1 or SB.72-39 standard calculate the clearance gap between the face of the oil lubricating nozzle and face of the bore in the front cover (Ref.Fig.506).

NOTE: Dimension A and B are checked before the tube end assembly is installed.

- (a) Check and record dimension A.
- (b) Ensure that the union nut is in contact with the flange on the spherical joint. Check and record dimension B.
- (c) Apply lubricant 'A' to the tube end assembly union nut then screw the tube end assembly into the front cover. Using torque wrench (Tool 694) and adapter (Tool 695) torque-tighten the castellated union nut to 460 lbf in. (52 N.m).

- (d) Check and record dimension C.
- (e) Calculate clearance gap D as follows:  
 $(A + C) - B = \text{clearance gap D.}$  This dimension must not be less than 0.020 in. (0,508 mm).
- (f) On completion of the dimensional check, slacken the tube end assembly union nut. Final torque-tightening is detailed later during assembly of tubes.

9. Assemble No.12 Labyrinth Seal to Diffuser Case for Adjusting Ring Checks

A. Prepare for Checks (Ref.Fig.507).

- (1) Select any adjusting ring from the range (72-34-00/2-120-210) (72-09-21 Repair, Fig.414) and measure and note the thickness of the ring.
- (2) Align the holes in the ring with the holes in the flange and place the ring over the shoulder bolts assembled to the flange.
- (3) Place the labyrinth seal (72-34-00/2-110) in position over the adjusting ring.
  - (a) Align the bolt-holes in the labyrinth seal flange with the adjusting ring holes. The shouldered bolt-holes in the labyrinth seal outer flange are identified by the recessed machined sections in the flange.
  - (b) Place the labyrinth seal in position on the adjusting ring. Temporarily secure the labyrinth seal with eight bolts (72-34-00/2-70) and four locking plates (72-34-00/2-80), assembling the bolts in pairs to the equally spaced locking plates. Tighten the bolts but do not lock the locking plates.

B. Calculate Adjusting Ring Thickness (Ref.Fig.507).

- (1) Measure the distance from the front outer joint flange of the diffuser case to the forward flange edge. Record as dimension C.
- (2) Measure the distance from the forward flange edge to the front edge of the labyrinth seal. Record as dimension D.

OVERHAUL

- (3) Obtain dimension G from the HP compressor rotor sub-assembly record (Ref.72-33-00 para.2.A.). Record as dimension E for this calculation.
- (4) Calculate the required adjusting thickness as follows:

$$(2.590 \text{ in. (65,756 mm)} - E) - (C + 0.510 \text{ in. (12,954 mm)} - D)$$

NOTE: If the calculated thickness is a plus (+) dimension, it must be added to the thickness of the installed adjusting ring. If the calculated thickness is a minus (-) dimension it must be subtracted from the thickness of the installed adjusting ring.

- (5) Select an adjusting ring of the calculated thickness from the range (72-34-00/2-120-210). Clearly identify the adjusting ring for assembly reference.
- (6) Measure the seal diameter at X. Record the dimension for main engine assembly reference. This dimension is part of Fits and Clearances Schedule (72-33-00 F.C.S.135).
- (7) Remove the bolts, locking plates, labyrinth seal and adjusting ring from the diffuser case.

#### 10. Assemble Air Duct Unit to Diffuser Case (Ref.Fig.508)

##### A. Prepare to Assemble Air Duct (72-51-01/2-60).

- (1) Install the bolts at vane flanges No.1 and 4.
  - (a) Insert six bolts (72-51-01/2-40) through each of the vane flanges with the threaded sections of bolts protruding towards the centre of the air duct.
  - (b) Use the assembly sleeve (Tool 1663) and secure each bolt in position with a retaining ring (72-51-01/2-30).

##### B. Assemble Air Duct.

- (1) Position the air duct (72-51-01/2-60) inside the diffuser case ensuring that the flange to which the nuts are attached is positioned uppermost.

OVERHAUL

- (2) Rotate the air duct to align the ports with vanes No.1,3,4,5 and 6 in the diffuser case, and the bolt-holes in the flange with the diffuser case flange holes.

## 11. Assemble Bearing Support To Diffuser Case (Ref.Fig.509)

### A. Prepare to Assemble Bearing Support.

- (1) Prepare a suitable flat surface beneath the diffuser case upon which the bearing support will be positioned.
- (2) With the front flange uppermost, carefully position the bearing support under the diffuser case.
- (3) Align the top position on the bearing support with the top position on the diffuser case.

### B. Assemble Bearing Support.

- (1) Apply lubricant 'C' to the bolts (72-51-01/5-90), previously assembled to the bearing support.
- (2) Gently raise the bearing support into position ensuring that the pin on the bearing support flange enters the hole in the diffuser case flange. Maintain support of the unit until sufficient bolts and nuts are assembled to retain it.
- (3) Secure the bearing support and air duct together with four bolts inserted through the bearing support flange and equally spaced. Ensure that the flat edge section of each bolt locates correctly. Secure each bolt with a self-locking nut (72-51-01/5-80).
- (4) Assemble bolts and nuts to the remaining positions and ensure that the nuts have a minimum locking (run-down) torque of 20 lbf in. (2,3 N.m). Torque-tighten the nuts to 210 lbf in. (24 N.m).

## 12. Assemble Coupling Assemblies to Air Duct Unit (Ref.Fig.510)

### A. Seal Ring Gap Checks.

- (1) Ensure thorough cleanliness of all components.

Printed in England

- (2) Select two seal rings (72-51-01/2-10). Carefully insert one ring into No.1 vane location and the other into No.4 vane location. Ensure that both seal rings are installed evenly.
- (3) Measure and record the gap between the seal ring ends of each component and check that the clearance figures obtained are within the limits quoted in the Fits and Clearances Schedule (72-51-01 F.C.S.181).
- (4) Remove each ring and identify in preparation for assembly to the couplings.
- (5) Select three seal rings (72-51-01/1-30-100-200) also (72-51-01/1-40-110-210). Carefully insert the seal rings into No.3-5-6 vane locations. Measure and record the gap between the seal ring ends of each component and check that the clearance figures obtained are within the limits quoted in Fits and Clearances Schedule (72-51-01 F.C.S.183-185-187-189).
- (6) Remove each ring and identify in preparation for assembly to the couplings.

**B. Assemble Couplings to Air Duct Vanes No.1 and 4.**

- (1) Assemble a seal ring assembly (72-51-01/2-10) to the grooved recess in each coupling (72-51-01/2-50).
- (2) Apply lubricant 'C' to the bolt threads.
- (3) Insert the coupling assemblies in No.1 and 4 vane locations. Secure each coupling with six nuts (72-51-01/2-20) ensuring that the nuts have a locking (run-down) torque of 10 lbf in. (1,1 N.m). Torque-tighten the nuts to 100 lbf in. (11,5 N.m).

**C. Assemble Couplings to Air Duct Vanes No.3,5 and 6.**

- (1) Assemble the two seal ring assemblies to the grooved recesses of the couplings. Position the larger diameter ring assembly nearest the coupling flange.
  - (a) Assemble the seal ring assembly (72-51-01/1-210) followed by seal ring assembly (72-51-01/1-200) to the coupling assembly (72-51-01/1-220).

- (b) Insert the coupling assembly into No.3 vane location.
- (c) Assemble the seal ring assembly (72-51-01/1-110) followed by seal ring assembly (72-51-01/1-100) to the coupling assembly (72-51-01/1-130).
- (d) Insert the coupling assembly into No.5 vane location.
- (e) Assemble the seal ring assembly (72-51-01/1-40) followed by seal ring assembly (72-51-01/1-30) to coupling assembly (72-51-01/1-50).
- (f) Insert the coupling assembly into No.6 vane location.

13. Calculate Thickness of Inner Adjusting Ring No.12 Labyrinth Seal

A. Assemble Labyrinth Seal.

- (1) Place the adjusting ring of previously calculated thickness in position on the diffuser case.
- (2) Place the labyrinth seal in position over the adjusting ring.
- (3) Temporarily secure the labyrinth seal with eight bolts (72-34-00/2-70) and four locking plates (72-34-00/2-80), assembling the bolts in pairs to the equally spaced locking plates.
- (4) Tighten the bolts but do not lock the locking plates.

B. Check Adjusting Ring Thickness (Ref.Fig.511).

- (1) Measure the gap between the rear flange face of the labyrinth seal and the front flange face of the air duct unit. Record as dimension AA.
- (2) Measure the thickness of the scalloped section of the bolt flange of the outer air duct. Record as dimension BB.
- (3) Deduct dimension BB from dimension AA and record as dimension CC.

(4) Select an adjusting ring of dimension CC thickness from the range (72-34-00/2-220 to 330) (72-09-21 Repair, Fig.415).

(5) Clearly identify the adjusting ring for assembly reference.

C. Remove Labyrinth Seal and Adjusting Ring.

(1) Remove the bolts and locking plates securing the labyrinth seal.

(2) Carefully remove the labyrinth seal and adjusting ring.

14. Assemble Air Duct Outer to Air Duct

A. Install Air Duct Outer to S.B.72-8627-209 Standard (Ref.Fig.511).

(1) Alternative outer air duct assembly (72-51-01/1A-270H,K). Apply lubricant 'A' to two off bolts (72-51-01/1-286A) and assemble to two off shank nut locations in outer air duct. Ensure that the bolts have a locking (run-down) torque of 10 lbf in. (1,1 Nm) then torque-tighten to 100 lbf in. (11,5 Nm).

(2) Slide the air duct outer (72-51-01/1A-270G,H,J,K) inside the bearing support.

(3) Align the bolt-holes in the air duct outer flange with holes in the air duct flange. Ensure that the air duct outer ports are radially aligned with those in the air duct.

(4) Press the air duct outer into position. The lower end of the unit will slide over the bearing front cover spigot.

15. Assemble No.12 Labyrinth Seal to Diffuser Case

A. Assemble Adjusting Rings.

(1) Place the inner adjusting ring of previously calculated thickness, on the air duct outer flange ensuring that the bolt-holes are correctly aligned.

SUB-ASSEMBLY

(2) Place the outer adjusting ring of previously calculated thickness in position on the outer flange.

(a) Align the holes in the ring with the holes in the flange and place the ring in position over the shoulder bolts in the flange.

**B. Assemble Labyrinth Seal.**

(1) Place the labyrinth seal in position over the adjusting rings.

(a) Press the labyrinth seal fully into position.

(b) Apply lubricant 'A' to the bolts and temporarily secure the labyrinth seal outer flange with the eight bolts and locking plates. Tighten the bolts but do not lock the locking plates.

(c) Apply lubricant 'C' to bolts (72-34-00/2-100). Temporarily secure the labyrinth flange inner with the eight bolts equally spaced.

**16. Assemble HP Thrust Bearing Air Cooling Components (Ref.Fig.512)**

**A. Prepare Spherical Seal Assembly.**

(1) Insert the spherical seal (72-51-01/3-170) through the flanged end of the spherical housing (72-51-01/3-190) and engage the seal with the two slots in the housing. Manipulate the spherical seal to obtain alignment of the bolt-holes.

(2) Apply lubricant 'A' to the securing bolt. Secure the seal to the housing with the location bolt (72-51-01/3-150) and keywasher (72-51-01/3-160). Torque-tighten the bolt to 40 lbf in. (4,5 N.m), then lock the keywasher.

**B. Assemble Spherical Seal, Insulated Tube and Elbow. (Ref. Fig.512 detail A).**

(1) Assemble the spherical housing and seal to No.3 vane duct.

(a) Apply lubricant 'A' to bolts.

(b) Insert the housing and seal into No.3 vane duct and secure the housing with four bolts (72-51-01/3-180) torque-tightened to 100 lbf in. (11,5 N.m).

SUB-ASSEMBLY

**72-00-51**

- (c) Retain the coupling at the two remaining locations with bolts (72-51-01/1A-230). Ensure that the bolts have a locking (run-down) torque of 10 lbf in. (1,1 N.m) then torque-tighten to 100 lbf in. (11,5 N.m).
- (2) Assemble the insulated tube assembly to No.3 vane.
- (a) Assemble the insulation top half (75-01-05/1-50) and bottom half (75-01-05/1-60) to the tube (75-01-05/1-40) and secure with three clips (75-01-05/1-70).
- (b) Insert the insulated tube into No.3 vane and ensure engagement with the spherical seal.
- (3) Secure the elbow (75-01-05/1-20) to the diffuser case.
- (a) Apply lubricant 'C' to the securing bolts (75-01-05/1-10).
- (b) Place the gasket (75-01-05/1-30) in position over the insulated tube flange on the diffuser case. Place the elbow over the gasket and secure it with four bolts (75-01-05/1-10). Torque-tighten the bolts to 135 lbf in. (15,2 N.m). Wire-lock the bolts together.

17. Secure Coupling to No.5 and 6 Vane Positions (Ref.Fig.512)

A. Secure Coupling to No.5 Position.

NOTE: Bolts finally torque-tightened to 100 lbf in. (11,5 N.m) must have a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m).

- (1) Align the bolt-holes in the coupling with the holes in the air duct outer. Apply lubricant 'A' to the securing bolts.
- (2) Place the bracket (72-51-01/1-190) (Ref.SB.72-114) in position and retain it with two bolts (72-51-01/1-140A).
- (3) Place the bracket (72-51-01/1-180) in position and retain it with two bolts (72-51-01/1-140).
- (4) Assemble two bolts (72-51-01/1-140) into the remaining locations.
- (5) Torque-tighten all the bracket/coupling bolts to 100 lbf in. (11,5 N.m).

B. Secure Coupling to No.6 Position.

- (1) Align the bolt-holes in the coupling with the holes in the air duct outer.
- (2) Apply lubricant 'A' to bolts (72-51-01/1-60).
- (3) Secure the coupling with six bolts torque-tightened to 100 lbf in. (11,5 N.m).

18. Check Radial Setting of No.12 Labyrinth Seal

A. Assemble Checking Equipment (Ref.Fig.513).

- (1) Assemble the lifting support (Tool 100) to the rear end of the bearing support. Ensure thorough cleanliness of the shaft section. Retain the support with nuts securely tightened.

OVERHAUL

- (2) Assemble the support piece (Tool 101) to the front flange of the diffuser case, and retain with nuts and bolts securely tightened. The tool is stored in container (Tool 1188).
- (3) Slide the support bars (Tool 102) into the locating bores in the spacing ring, allowing sufficient clearance for the concentricity column to pass through the centre of the spacing ring. The tool is stored in container (Tool 1188).
- (4) Attach the lifting sling (Tool 1573) and crane hoist to the concentricity column (Tool 103) and carefully raise it to a vertical position. The concentricity column is stored in container (Tool 1189).
- (5) Ensure thorough cleanliness of the machined end sections and the bore in the lower end of the concentricity column.
- (6) Raise the concentricity column and position it concentrically above the spacing ring.
- (7) Carefully lower the column into the diffuser case assembly until engagement with the lifting support shaft is effected. Do not lower the column into the bearing at this stage.
- (8) Carefully adjust the support bars to centralize the column. Gently lower the concentricity column finally into position. Remove the lifting sling and crane hoist from the column.
- (9) Attach the multiple leg sling (Tool 1645) and crane hoist to the locating cone (Tool 1186).
- (10) Ensure thorough cleanliness of the bore in the locating cone. Raise the locating cone and remove the nuts and washers from the retaining bolts in the flange. Position the locating cone centrally over the spacing ring.
- (11) Carefully lower the locating cone in position on the spacing ring ensuring that the concentricity column enters freely into the bore and that the bolts enter freely into the spacing ring flange.

- (12) Secure the locating cone to the spacing ring with nuts and flat washers.
- (13) Withdraw the support bars sufficiently to permit the concentricity column to rotate.
- (14) Check the column by hand for free rotation, if satisfactory, remove the support bars from the spacing ring.

CAUTION: SUPPORT BARS MUST ALWAYS BE IN POSITION AND RESTRAINING CONCENTRICITY COLUMN DURING AND AFTER REMOVAL OF LOCATING CONE. DAMAGE TO BEARING ASSEMBLY COULD OTHERWISE RESULT.

- (15) Assemble the clamp attachment (Tool 104) to the concentricity column. The clamp attachment is stored in container (Tool 1188).
  - (a) Separate the half sections of the clamp attachment by unscrewing the four lever type bolts.
  - (b) Ensure cleanliness of the clamp half sections, then assemble the sections to the machined area of the concentricity column located near the top of the fixture.
  - (c) Secure the clamp half sections together with four lever type bolts securely hand tightened.
  - (d) Assemble a 0.050 in. (1,270 mm) total reading dial indicator and clock adapter (Tool 1187) to the clamp attachment. The tool is stored in container (Tool 1188).

B. Check Labyrinth Seal (Ref.Fig.513).

- (1) Adjust the equipment to establish contact between the stylus of the dial indicator and the large diameter labyrinth seal (Ref.Fig.513 detail A). Set the dial indicator to '0' position.
- (2) On engines to Pre S.B.72-123 standard slowly rotate the concentricity column and note any variation in the dial indicator readings. Total dial indicator variation must not exceed 0.010 in. (0,254 mm).
  - (a) If the labyrinth seal is not centralized, slacken the bolts securing the seal, adjust the position of the seal to centralize it, then tighten the bolts.

- (b) Re-check the labyrinth seal concentricity setting to ensure it is within the limits.
- (3) On engine to S.B.72-123 standard slowly rotate the concentricity column and note any variation in the indicator readings. Set the labyrinth seal to achieve an eccentricity of 0.008 in. to 0.010 in. (0,203 mm to 0,254 mm) toward bottom dead centre.
  - (a) If the labyrinth seal is not correctly positioned, slacken the bolts securing the seal, adjust the position of the seal, then tighten the bolts.
  - (b) Re-check the labyrinth seal eccentricity setting to ensure it is within the limits.
- C. Secure Labyrinth Seal.
  - (1) Apply lubricant 'C' to the securing bolts (72-34-00/2-70).
  - (2) Secure the labyrinth with the bolts and locking plates (72-34-00/2-80-90) assembled to the outer flange. Torque-tighten the bolts to 210 lbf in. (24 N.m). Ensure that the bolts installed temporarily are also finally torque-tightened.
  - (3) Secure the labyrinth seal inner flange with bolts (72-34-00/2-100) lubricated with lubricant 'C'. Ensure that the bolts have a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m). Torque-tighten the bolts to 100 lbf in. (11,5 N.m).
  - (4) Finally check the concentricity of the labyrinth.
- D. Remove Checking Equipment.
  - (1) Remove the dial indicator measuring equipment from the clamp attachment, and place it in container (Tool 1188).

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (2) Remove the clamp attachment half sections from the concentricity column by unscrewing the lever type bolts. Place the clamp attachment into the container (Tool 1188).
- (3) Slide the support bars into position in the spacing ring. Ensure that each bar is in contact with the column and locked in position.
- (4) Attach the multiple leg sling (Tool 1645) and crane hoist to the locating cone.
- (5) Remove the nuts and washers securing the locating cone to the spacing ring.
- (6) Carefully remove the locating cone from the spacing ring and concentricity column. Ensure that the column does not move out of position during this operation.
- (7) Screw the nuts and flat washers on to the locating cone retaining bolts.
- (8) Remove the sling and crane hoist from the locating cone.
- (9) Attach the lifting sling (Tool 1573) and crane hoist to the column. Ensure that the lifting force will be applied vertically.
- (10) Carefully apply sufficient lifting force to minimise the movement of the column when the support bars are withdrawn. Do not remove the column at this stage.
- (11) Withdraw the support bars from the spacing ring.
- (12) Carefully lift the column clear of the diffuser case, lower it into the container (Tool 1189), then remove the lifting sling and crane hoist.
- (13) Remove the nuts and bolts securing the spacing ring to the diffuser case flange.
- (14) Remove the spacing ring from the diffuser case. Secure the nuts and bolts to the flange.
- (15) Remove the lifting support from the rear end of the bearing support.

E. Lock Shoulder Bolts on Labyrinth Seal Outer Flange  
(Ref.Fig.514).

- (1) Assemble the eccentric locking items.

NOTE: The inner sleeve and centering sleeve must be rotated and inter adjusted until the outer sleeve will engage with the inner sleeve and simultaneously be fully inserted in the machined recess hole in the flange. The locking assembly will then be positive.

- (a) Place the centering sleeve (72-34-00/2-50) over the shoulder bolt.
- (b) Place the inner sleeve (72-34-00/2-60) over the centering sleeve.
- (c) Place the outer sleeve (72-34-00/2-40) over the inner sleeve.
- (d) Assemble the locking sleeve spacer (72-34-00/2-30) to the outer sleeve.
- (e) Apply lubricant 'C' to the shoulder bolt, place the flat washer (72-34-00/2-20) over the bolt and retain with a locknut (72-34-00/2-10).
- (f) Ensure that the locknuts have a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m). Torque-tighten the locknut to 100 lbf in. (11,5 N.m).

19. Remove Bearing Centralizing Strip

A. Remove HP Turbine Bearing.

- (1) Remove the bolts securing the retaining ring to the bearing housing.
- (2) Withdraw the retaining ring and clearly identify it for assembly reference.

(3) Withdraw the bearing unit and centralizing strip (or four feeler gauges if fitted in lieu of centralizing strip) from the bearing housing. Place the bearing unit in a suitable container clearly identified for assembly reference.

(4) Remove the centralizing strip from the bearing.

20. Assemble Squeeze Film Oil Jet and HP Bearing Unit to Bearing Housing (Ref.Fig.515)

A. Prepare Jet for Assembly.

- (1) Ensure thorough cleanliness of components and tools.
- (2) Insert the jet into the plate guide (Tool 585) ensuring that the flat edge of the jet flange is parallel with the sight line on the tool.
- (3) Retain the jet in position with the pin (Tool 586) assembled to the threaded section of the jet.
- (4) Freeze the jet and assembly tool using a suitable freezing agent. Protective gloves must be worn when handling frozen components.

B. Assemble Jet to Bearing Housing.

- (1) On completion of the freezing procedure, carry out the following procedure with minimum delay. Do not remove the assembly tools from the jet at this stage.
- (2) Align the jet with the hole in the bearing housing. The locating pins on the plate guide will engage with the recess in the bearing housing.
- (3) Ensure that the oil feed hole in the jet will align with the hole in the bearing housing.
- (4) Press the jet fully into position and do not disturb it until the temperature of the components is equalised.
- (5) Remove the assembly tools from the jet.

SUB-ASSEMBLY

C. Assemble Bearing Unit to Bearing Housing.

- (1) Assemble the bearing to the bearing housing ensuring that the castellations fully engage. Place the retaining ring of the previously calculated thickness into position on the bearing assembly ensuring that the oil jet hole locates correctly over the oil jet. Apply lubricant 'A' to securing items.
- (2) Secure the retaining ring with eight bolts (72-51-01/4-240) and assemble the locknut (72-51-01/4-250) to the oil jet thread. Ensure that the nut and bolts have a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m). Torque-tighten the nut and bolts to 100 lbf in. (11,5 N.m).

21. Assemble No.16 Labyrinth Ring to Bearing Housing (Ref. Fig.505)

A. Prepare to Assemble Labyrinth Ring.

- (1) Assemble 24 bolts (72-51-01/4-220) to the rear flange of the bearing housing. Ensure that the flat section of each bolthead is correctly positioned in the flange recess (Ref. Fig.505 View B).
- (2) Apply lubricant 'A' to the bolt threads.
- (3) Apply a light smear of jointing compound 'D' to the labyrinth ring at the bearing housing location.

B. Assemble Labyrinth Ring.

- (1) Position the labyrinth ring on the bearing housing, ensuring that the top extraction lug is correctly positioned.

NOTE: When assembling a new labyrinth ring, the word 'TOP' may not be vibro-etched on one of the extraction lugs. The assembly procedure in this case is to position the labyrinth ring on the bearing housing with an extraction lug at the top position. The top position is identifiable by reference to the marking on the bearing support. Lightly vibro-etch 'TOP' on the extraction lug in the top position following assembly.

SUB-ASSEMBLY

72-00-51

Page 542

- (2) Secure the labyrinth ring to the bearing housing with 24 locknuts (72-51-01/4-210). Ensure that the locknuts have a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m). Torque-tighten the nuts to 100 lbf in. (11,5 N.m).

- (3) Re-check the bolts for correct assembly to the bearing housing.

22. Assemble HP Turbine Bearing Oil Feed and Scavenge Tubes to Bearing Housing (Ref.Fig.516, 517)

**CAUTION:** ENSURE THAT INSULATION BLANKETS AND CLIPS ARE COMPATIBLE WITH THE TUBE TO WHICH THEY ARE TO BE ASSEMBLED.

A. Prepare Oil Feed Tube.

- (1) Assemble the thermal insulation blankets (72-34-00/1-100-110-120-130) to the oil feed tube (72-34-00/1-80).
- (2) On engines to pre S.B.72-8477-200 standard, secure the blankets with clips (72-34-00/1-90A).
- (3) On engines to S.B.72-8477-200 standard, secure the blankets with retaining clip straps and sleeves (72-34-00/1-90B, 95A) as detailed in paragraph B.

B. Procedure for Installing Retaining Clip to S.B.72-8477-200 Standard on Insulation Blanket (Ref.Fig.516).

- (1) Assemble the retaining slip sleeve over the long portion of the retaining clip strap then slide the sleeve to the hooked end of the strap (Detail A).
- (2) Hold the hooked end of the strap against the insulation blanket joint line in the clip recess, then wrap the strap around the blanket and thread the end of the strap through the sleeve (Detail B).
- (3) Insert a length of 0,80 mm diameter locking wire under the strap in line with the hole in the strap end.
- (4) Tighten retaining clip strap (Detail C).
  - (a) Position the tensioning tool (Tool 3127) as shown and insert the tensioning tool tightening pin through the hole in the clip strap.

OVERHAUL

snecma

- (b) Unscrew the tensioning tool puller until the blanket halves are tight and secure on the tube.
  - (c) Manoeuvre the tensioning tool so that the clip strap is folded as far as possible over clip sleeve.
- (5) Remove the tensioning tool.
  - (6) Wire-lock retaining clip strap (Detail E).
    - (a) Thread the locking wire through the hole in the end of the clip strap.
    - (b) Press the end of clip strap against the section of clip strap securing the insulation blanket.
    - (c) Wire-lock together the sections of the clip strap.
- C. Install Oil Feed Tube.
- (1) Position the oil feed tube inside the air duct outer.
  - (2) Align the tube union nut with the tube end assembly located near the twin air duct connections on the bearing front cover.
  - (3) Insert the tube end through No.5 vane.
  - (4) Assemble the tube bush and clip assembly (72-34-00/1-50-60-70) to the tube and attach it to the small bracket positioned on No.5 vane duct.
    - (a) Apply lubricant 'A' to the bolt threads.
    - (b) Ensure that the nut has a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m). Torque-tighten the nut to 100 lbf in. (11,5 N.m).
  - (5) Apply lubricant 'A' to the tube union nut and screw it on to the tube end assembly hand-tight.
  - (6) Torque-tighten the castellated nut securing the tube end assembly to the bearing housing to 460 lbf in. (51,9 N.m) using the wrench spanner (Tool 6940 and adapter (Tool 695).

OVERHAUL

- (7) Torque-tighten the tube union nut to 295 lbf in. (33 N.m) using the cranked wrench spanner (Tool 1552).

D. Prepare Oil Scavenge Tube.

- (1) Assemble the thermal insulation blankets (72-34-00/1-230-240-250-260) to the oil scavenge tube (72-34-00/1-210).
- (a) On engines to pre S.B.72-8477-200 standard, secure the blankets with clips (72-34-00/1-220A or 220B).
- (b) On engines to S.B.72-8477-200 standard, secure the blankets with clip straps and sleeves (72-34-00/1-220C, 225A) as detailed in paragraph B.

E. Assemble Oil Scavenge Tube.

- (1) Position the tube inside the air duct outer. Align the tube union nut with the tube end assembly located at the bottom position on the bearing housing.
- (2) Insert the tube end through No.5 vane. Assemble the tube bush and clip assembly (72-34-00/1-180-190-200) to the tube and attach it to the bracket on No.5 vane duct with a nut, bolt and washer (72-34-00/1-150-170-160).
- (a) Apply lubricant 'A' to the bolt threads. Ensure that the nut has a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m). Torque-tighten the nut to 100 lbf in. (11,5 N.m).

- (3) Apply lubricant 'A' to the union nut and screw it on to the tube end assembly hand-tight.
- (4) Torque-tighten the castellated nut securing the tube end assembly to the bearing housing to 460 lbf in. (52 N.m) using wrench spanner (Tool 694) and adapter (Tool 695).
- (5) Torque-tighten the tube union nut to 420 lbf in. (47 N.m) using the cranked wrench spanner (Tool 1546).

F. On engines to SB.72-8800-311 Standard, Assemble Insulation Blankets. (Ref.Fig.516, 517A)

- (1) Assemble the thermal insulation blankets (72-51-01/3-193) to the oil feed tube end, and secure with clips (72-51-01/3-195-197).
- (2) Assemble the thermal insulation blankets (72-51-01/3-243) to the oil scavenge tube end, and secure with clips (72-51-01/3-245-246-247).

23. Assemble HP Bearing Vent Tube to Bearing Housing (Ref.Fig.517)

CAUTION: ENSURE THAT INSULATION BLANKETS AND CLIPS ARE COMPATIBLE WITH THE TUBE TO WHICH THEY ARE TO BE ASSEMBLED.

A. Prepare Vent Tube.

- (1) Assemble the thermal insulation blankets (72-34-00/1-360-370-380-390) to the vent tube (72-34-00/1-340).
  - (a) On engines to pre S.B.72-8477-200 standard, secure the blankets with clips (72-34-00/1-350A or 350B).
  - (b) On engines to S.B.72-8477-200 standard, secure the blankets with clip straps and sleeves (72-34-00/1-350C, 355B, 358A) in accordance with the procedure detailed previously for oil tubes installation. Position the longer clip strap (355B) in the forward recess of the blankets located on the tube junction block.
- (2) Apply lubricant 'A' to the thread of the union body (72-34-00/1-400).
- (3) Assemble the following items to the branch tapping in the vent tube.

SUB-ASSEMBLY  
**72-00-51**

Page 547  
Dec 1/85

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (a) Union body (72-34-00/1-400A) and one flat washer (72-34-00/1-410A) Pre-SB.72-82, two flat washers (72-34-00/1-410A) with the union body (72-34-00/1-400A) SB.72-82 Part 2, or union body (72-34-00/1-400B) and flat washer (72-34-00/1-410B) SB.72-82, Part 1.

- (4) Torque-tighten the union body to 125 lbf in. (14 N.m). Wire-lock the union body to the nearby hole.

B. Assemble Vent Tube.

- (1) Position the vent tube inside the air duct outer. Align the tube ends with the flexible drains tube and adapter.

- (2) Insert the outlet end of the tube through No.5 vane. Assemble the tube bush and clip assembly (72-34-00/1-310-320-330) with a nut, bolt and washer (72-34-00/1-280-300-290) to the remaining location on the bracket attached to No.5 vane duct.

- (a) Apply lubricant 'A' to the bolt threads. Ensure that the nut has a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m). Torque-tighten the nut to 100 lbf in. (11,5 N.m).

- (3) Apply lubricant 'A' to the tube union connections.

- (4) Screw the flexible drain tube union nut on to the tube union body and torque-tighten it to 125 lbf in. (14 N.m), using spanner (Tool 1181).

- (5) Screw the tube union nut on to the adapter and torque-tighten it to 325 lbf in. (37 N.m), using spanner (Tool 1545).

24. Assemble Air Duct to Diffuser Case at No.5 Vane Position

A. Position Air Duct (75-02-12/1-50) (Ref.Fig.517).

- (1) Position the air duct over the three tubes protruding through No.5 vane.
- (2) Place the Locating plate (75-02-12/1-110) over the three tube ends protruding through the air duct.
- (3) Apply lubricant 'A' to the tube end threads.

SUB-ASSEMBLY  
**72-00-51**

Page 548

(4) Screw the slotted nuts on to the tube ends as follows:

- (a) Oil feed tube slotted nut (75-02-12/1-120).
- (b) Oil scavenge tube slotted nut (75-02-12/1-130).
- (c) Vent tube slotted nut (75-02-12/1-140).

B. Secure Air Duct.

- (1) Assemble the two stiffener plates (75-02-12/1-80) to the air duct bolt flange.
  - (a) Apply lubricant 'C' to the retaining bolts (75-02-12/1-60-70).
  - (b) Place the stiffener plates in position on the air duct flange.
  - (c) Assemble the bracket (75-02-12/1-90) to the rear of the stiffener plates and secure with two bolts (75-02-12/1-70).
  - (d) Assemble the bracket (75-02-12/1-100) to the right-hand stiffener plate and secure with two bolts (75-02-12/1-70).
  - (e) Secure the stiffener plates at the remaining locations with bolts (75-02-12/1-60). Ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the bolts to 100 lbf in. (11,5 N.m) using cranked spanner (Tool 1583).

C. Secure Tube Slotted Nuts.

- (1) Torque-tighten the oil feed tube between 280 and 310 lbf in. (31,6 and 35,0 N.m) using wrench (Tool 1533).
- (2) Torque-tighten the oil scavenge tube between 400 and 440 lbf in. (45,2 and 49,7 N.m) using wrench (Tool 1540).
- (3) Torque-tighten the vent tube between 310 and 340 lbf in. (35,0 and 38,4 N.m) using wrench (Tool 1540).

CONCORDE

## OLYMPUS 593 OVERHAUL MANUAL

Temporary Revision 72-530  
Insert in 72-00-51 before page 551

### REASON FOR ISSUE

With the deletion of the inner air duct introduced by S.B.72-8627-209 it has been found possible to fit the No.4 bearing cooling air tubes incorrectly such that a rub could occur between the tubes and the adjacent rotating H.P. compressor rear shaft. (MRA 97)

### ACTION

Add a CAUTION to Para. 25 (B) (1) to read:-

CAUTION: THESE TUBES ARE 'HANDED' AND IT IS IMPORTANT THAT TUBE 72-51-01/3-30 IS FITTED IN THE RIGHT HAND POSITION AS VIEWED IN FIGURE 517 AND TUBE 72-51-01/3-70 FITTED IN THE LEFT HAND POSITION. WHEN CORRECTLY FITTED THE CRANKED END OF THE TUBES AT THE REAR LOCATION IN THE NO. 4 BEARING HOUSING IS TOWARDS THE OUTSIDE OF THE C.C.O.C. GIVING THE MAXIMUM CLEARANCE OF THE TUBE TO THE H.P. COMPRESSOR SHAFT.

MK.610-14-28  
OVERHAUL

SEE TR

25. Assemble HP Bearing Cooling Tubes to Bearing Housing Unit and Duct at No.3 Vane (Ref.Fig.518)

A. Prepare Tubes.

- (1) Assemble the thermal insulation blanket top and bottom (72-51-01/3-50-60) to the tube assembly (72-51-01/3-30).
- (2) Secure the blankets with clips (72-51-01/3-80).
- (3) Assemble the thermal insulation blanket top and bottom (72-51-01/3-90-100) to the tube assembly (72-51-01/3-70).
- (4) Secure the blankets with clips 972-51-01/3-80).

B. Assemble Tubes.

- (1) Insert tube (72-51-01/3-30) in the port at location A, fig.518 and tube (72-51-01/3-70) in the port at location B of the bearing cover unit.
  - (a) Position each tube so that the bracket retaining plates face each other and are located near the No.3 vane duct.
  - (b) Assemble the tube elbow (72-51-01/3-140) to the tubes in readiness for assembly to No.3 vane duct.
  - (c) Apply lubricant 'A' to the securing bolts.
  - (d) Align the tube elbow flange bolt-holes with the holes in No.3 vane duct.
  - (e) Loosely retain the tube elbow to the vane duct with three bolts (72-51-01/3-110) and keywashers (72-51-01/3-120) leaving the bottom hole open.
  - (f) Position the bracket (72-51-01/3-130) on the cooling tubes retaining plates and bottom hole in the tube elbow flange.
  - (g) Secure the bracket to the tube elbow with a bolt and keywasher.

OVERHAUL

- (h) Secure the bracket to the cooling tubes retaining plates with two bolts 972-51-01/3-100 and key-washers (72-51-01/3-20).
- (j) Torque-tighten the bolts securing the tube elbow to the vane duct to 100 lbf in. (11,5 N.m). Lock the keywashers.
- (k) Torque-tighten the bolts securing the bracket to the cooling tubes to 100 lbf in. (11,5 N.m). Lock the keywashers.

## 26. Flow and Pressure Test HP Bearing Oil System

### A. Test Equipment Required.

- (1) An oil pressure test rig capable of a flow rate up to 100 gal/h (Imp.) (454.6 litres/hour) of oil at a temperature of 120 deg C with a delivery pressure up to 50 psi (345 Kpa) to the oil jet (Tool 1926).
- (2) Oil specification: Lubricant 'A'.

### B. Assemble Pressure Test Equipment to Bearing Housing (Ref.Fig.519).

- (1) Rotate the build stand to facilitate assembly of the adapter (Tool 992) front and rear blanks to the bearing housing.
  - (a) Assemble the rear blank to the rear bore of the bearing housing. Position the vent/drain tap at the top position for air venting purposes.
  - (b) Assemble the front blank to the front bore of the bearing housing and secure the blanks together with the captive nut on the front blank. Tighten the captive nut securely.
- (2) Assemble the oil inlet feed adapter (Tool 812) and oil scavenge adapter (Tool 813) to the tubes at No.5 vane.
  - (a) Screw the adapter union on to the appropriate tube end and tighten.

SUB-ASSEMBLY

**72-00-51**

Page 553

Dec 1/84

OLYMPUS 593

MK.610-14-28  
OVERHAUL

C. Prepare Pressure Test/Flow Check Equipment.

- (1) Ensure that the correct amount of oil is contained in the pressure test equipment. Suitable protective clothing must be worn to minimise personal contact with the oil.
- (2) Connect the flowmeter electrical plug and instrumentation plug to the respective locations on the mobile pressure test equipment. Place the flowmeter in a convenient but safe position.
- (3) Connect the feed and scavenge hoses to the feed and scavenge adapters on No.5 vane. Ensure that the connections are tight.
- (4) Ensure that the vent tap on the rear blank of the bearing housing is closed.
- (5) Connect the pressure test equipment to an earthed electricity supply of 30 A 600 V a.c. Ensure that the circulating pump is switched OFF.
- (6) Open the return stop valve on the pressure test equipment.

D. Flow Check Bearing Assembly.

- (1) Switch ON the circulating pump and adjust the pressure controller to give a delivery oil pressure of 10 psig (69 Kpa) for circulating and venting purposes. Ensure that the flowmeter is functioning.
- (2) Carefully open the vent tap on the rear blank to release the trapped air. Catch residual oil in a suitable container.
- (3) Close the vent tap when the trapped air has been expelled.
- (4) Check the oil connections and blanks for oil leakage. Rectify leaks as necessary (Ref. para.K.L.Q).
- (5) Switch ON the oil heater to raise the oil temperature to 120 deg C.

WARNING: ADEQUATE VENTILATION IS ESSENTIAL. HEAT AND OIL RESISTANT CLOTHING MUST BE WORN DURING OPERATIONS INVOLVING CONTACT WITH HEATED OIL AND COMPONENTS.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (6) When the oil temperature is at 120 deg C switch OFF the circulating pump and carefully open the rear blank vent tap to finally release trapped air.
- (7) CLOSE the vent tap and switch ON the circulating pump.
- (8) Adjust the oil pressure to achieve a differential of 48 psig (330 Kpa) between the oil feed and scavenge. Circulate the oil at the given pressure and temperature for a period of fifteen minutes to equalise the temperature of components.
- (9) On completion of the oil circulation, time check to ensure that the oil flow pressure rate is maintained. Observe and record the oil flow rate indication on the flowmeter.
- (10) Acceptable flow rates are as follows:

(a) Engines pre	38 to 43 gal/h (Imp.)
SB72-8800-311	(172,75 to 195,48 litres/h)
(b) Engines to	55 to 75 gal/h (Imp.)
SB72-8800-311	(250,03 to 340,95 litres/h)
- (11) On completion of a satisfactory flow test, switch OFF the oil heater and circulating pump. Switch off the electricity supply to the equipment and disconnect the oil flowmeter. Ensure that the flowmeter is safely stored.

E. Investigate and Rectify Unsatisfactory Oil Flow.

NOTE : Before commencing disassembly of engine components for examination of the oil jet, examine the mobile pressure test equipment and associated items for possible malfunction.

- (1) Remove adapter blanks (front) and (rear).
  - (a) Switch OFF oil heater.
  - (b) Switch OFF the electricity supply to the pressure test equipment.
  - (c) Rotate the assembly stand to assist oil drainage from the bearing housing rear blank.
  - (d) Open the drain tap on the rear blank, and drain oil into a clean container.

SUB-ASSEMBLY

**72-00-51**

MK.610-14-28

OVERHAUL

- (e) Support the bearing housing rear blank and unscrew the captive nut on the front blank.
- (f) Remove the rear and front blanks.
- (2) Remove the bearing assembly from the bearing housing (Ref.Fig.521).
  - (a) Remove the nuts securing the No.16 labyrinth ring to the bearing housing. Carefully remove the labyrinth ring.
  - (b) Remove the eight bolts securing the bearing retaining ring to the bearing housing. Remove the oil jet locknut from the retaining ring.
  - (c) Carefully remove the retaining ring and ensure that it is clearly identified for assembly reference.
  - (d) Carefully withdraw the bearing assembly from the housing. Clearly identify the bearing, and place it in a clean sealed container.
- (3) Examine the oilways and ports for possible cause of low oil flow.
- (4) If necessary remove the squeeze film oil jet for investigation (Ref.Fig.521).
  - (a) Assemble the mechanical puller (Tool 587) to the oil jet.
  - (b) Carefully extract the oil jet.
- F. Assemble Components after Investigation of Unsatisfactory Oil Flow Test.
  - (1) Prepare the squeeze film oil jet for assembly.
    - (a) Ensure thorough cleanliness of components and tools.
    - (b) Insert the jet into assembly plate guide (Tool 585) ensuring that the flat edge of the flange is parallel with the sight line on the tool (Ref.Fig.515).

OVERHAUL

- (c) Retain the jet in position with the pin (Tool 586) assembled to the threaded section of the jet.
  - (d) Freeze the jet and assembly tool, using a suitable freezing agent. Protective gloves must be worn when handling frozen components.
- (2) Assemble the jet to the bearing housing.
- (a) On completion of the freezing procedure carry out the following procedure with the minimum delay. Do not remove the assembly tools from the jet at this stage.
  - (b) Align the jet with the hole in the bearing housing also align the locating pins on the plate guide with the recess in the bearing housing.
  - (c) Ensure that the oil feed hole in the jet will align with the hole in the bearing housing.
  - (d) Press the jet fully into position and do not disturb it until the temperature of the components is equalised.
  - (e) Remove the assembly tools from the jet.
- (3) Assemble the bearing unit to the bearing housing.
- (a) Assemble the bearing to the bearing housing ensuring that the castellations fully engage.
  - (b) Place the identified retaining ring in position on the bearing assembly, ensuring that the oil jet hole locates correctly over the oil jet. Apply lubricant 'A' to securing items.
  - (c) Secure the retaining ring with eight bolts (72-51-01/4-240) and assemble the locknut (72-51-01/4-250) to the oil jet thread. Ensure that the nut and bolts have a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m). Torque-tighten the nut and bolts to 100 lbf in. (11,5 N.m).
  - (d) Check that the correct bearing end-float (0.0015/ 0.0005 in. (0,0381/0,0127 mm)) is present, using feeler gauges. If necessary, replace the retaining ring to obtain the correct bearing end-float.

OVERHAUL

- (4) Assemble the No.16 labyrinth ring to the bearing housing.
  - (a) Check and ensure that the bolts on the rear flange of the bearing housing are correctly positioned with the flat sections of the bolt-heads located in the flanged recess.
  - (b) Apply lubricant 'A' to the bolt threads.
  - (c) Apply a light smear of jointing compound 'D' to the labyrinth ring at the bearing housing location.
  - (d) Position the labyrinth ring on the bearing housing, ensuring that the top extraction lug is correctly positioned.
  - (e) Secure the labyrinth ring to the bearing housing with locknuts (72-51-01/4-210). Ensure that the locknuts have a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m). Torque-tighten the nuts to 100 lbf in. (11,5 N.m).
  - (f) Re-check the bolts for correct assembly to the bearing housing.
- G. Re-Assemble Pressure Test Blanks to Bearing Housing and Repeat Flow Test.
  - (1) Rotate the assembly stand to facilitate the assembly of the blanks to the bearing housing.
  - (2) Assemble the rear blank to the rear bore of the bearing housing. Position the vent/drain tap at the top position for air venting purposes.
  - (3) Assemble the front blank to the front bore of the bearing housing and secure the blanks together with the captive nut on the front blank. Tighten the captive nut securely.
  - (4) Repeat the flow test procedure (Ref.para.D).
- H. Pressure Test Bearing Assembly (Ref.Fig.519).
  - (1) Ensure that the vent/drain tap on the bearing housing rear blank is closed and that the return stop valve on the pressure test equipment is OPEN.

SUB-ASSEMBLY

**72-00-51**

Page 559

Sep 1/85

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (2) Rotate the assembly stand in order to position No.5 vane on the underside of the sub-assembly during pressure test. This is necessary to allow the oil leakage to drain from the vent tube installed through No.5 vane. The vent tube must remain un-blanked throughout the pressure test procedure.
- (3) Switch ON the circulating pump and adjust the delivery oil pressure to 10 psi (69 Kpa) for circulating and venting purposes.
- (4) Carefully open the vent tap on the rear blank to release the trapped air. Catch the residual oil in a suitable container.
- (5) Close the vent tap when the trapped air has been expelled.
- (6) Switch ON the oil heater to raise the oil temperature to 120 deg C. Switch OFF the heater when the given temperature is achieved.
- (7) When the oil temperature is at 120 deg C, switch OFF the circulating pump and carefully open the rear blank vent tap to finally release trapped air.
- (8) Close the vent tap and switch ON the circulating pump.
- (9) CLOSE the return stop valve and adjust the oil pressure controller to give a pressure of 10 psig (69 Kpa) on the oil scavenge pressure gauge.
- (10) OPEN the return stop valve periodically and switch on the oil heater as necessary to maintain minimum oil temperature of 80 deg C evenly in the system. Ensure that the given pressure is resumed after circulation.
- (11) Check the assembly for oil leakage or seepage.

NOTE: A 30 minute pressure test period is necessary to allow oil leaks to accumulate and become evident in the cold vent tube on No.5 vane, or under the bearing housing front cover insulation blankets.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (12) Oil leakage is unacceptable, but slight seepage of oil can be accepted.

NOTE: An oil leak is considered as drops or globules of oil forming within the specified time and conditions of the pressure test and a seepage is considered as oil dampness which may spread but does not form a droplet or globule within the specified time and conditions of the pressure test.

- (13) Any disturbance of oil carrying components after pressure test will necessitate complete re-pressure test.

J. Remove Equipment After Satisfactory Pressure Test.

- (1) Switch off the circulating pump and oil heater.
- (2) Disconnect the pressure test equipment electrical plug from the mains supply.
- (3) Open the return stop valve.
- (4) Rotate the build stand to assist oil drainage from the bearing housing rear blank.
- (5) Open the drain tap on the rear blank and drain the oil into a clean container.
- (6) Support the bearing housing rear blank.
- (7) Unscrew the captive nut attached to the front blank.
- (8) Remove the rear and front blanks.
- (9) Disconnect the oil feed and scavenge hoses from the adapters at No.5 vane.
- (10) Disconnect the adapters from the oil feed and scavenge tubes at No.5 vane. Assemble suitable protectors to the tube ends.
- (11) Wire-lock the tube fittings positioned internally, and the slotted nuts located at No.5 vane (Ref.Fig.522).

K. Investigate Oil Leakage.

- (1) Leakage from bearing housing blanks is easily detected.
- (2) Leakage from oil feed or scavenge tube end assemblies spherical seals can be detected by the emergence of oil from the following positions.
  - (a) Under the bearing housing front cover insulation blanket.
  - (b) Vent/drain tube protruding through No.5 vane.
- (3) Leakage from No.16 labyrinth ring joint is easily detected.

L. Rectify Oil Leakage from Bearing Housing Blanks.

- (1) Check the tightness of the captive nut on the bearing housing front blank.
- (2) If leakage continues after captive nut has been fully tightened, remove the bearing housing blanks for examination of the seals.
  - (a) Switch OFF the circulating pump and oil heater.
  - (b) Disconnect the pressure test equipment electrical plug from the mains supply.
  - (c) Open the return stop valve.
  - (d) Rotate the assembly stand to assist oil drainage from the bearing housing rear blank.
  - (e) Open the drain tap on the rear blank and drain the oil into a clean container.
  - (f) Support the bearing housing rear blank.
  - (g) Unscrew the captive nut attached to the front blank.
  - (h) Remove the rear and front blanks.
  - (j) Check blanks and locations for cleanliness.
  - (k) Change blank seals if necessary.

M. Assemble Blanks to Bearing Housing.

- (1) Assemble the rear blank to the rear bore of the bearing housing. Position the vent/drain tap at the top position for air venting purposes.
- (2) Assemble the front blank to the front bore of the bearing housing and secure the blanks together with the captive nut attached to the front blank. Tighten the captive nut securely.
- (3) Pressure test the bearing assembly (Ref. para.H).
- (4) Remove the pressure test equipment and wire-lock the tubes (Ref. para.J).

N. Rectify Oil Leakage from Tube End Assemblies.

- (1) Check the oil feed and oil scavenge tube end assemblies for evidence of leakage.
  - (a) Examine each tube end assembly in the vicinity of castellated nut for evidence of oil leakage through the sealing rings. If no oil is evident, it will be necessary to remove both tube end assemblies for examination of the spherical sealing joints.
- (2) Switch OFF the circulating pump and oil heater.
- (3) Disconnect the pressure test equipment electrical plug from the mains supply.
- (4) OPEN the return stop valve.
- (5) Rotate the assembly stand to assist oil drainage from the bearing housing rear blank.
- (6) Open the drain tap on the rear blank and drain the oil into a clean container.
- (7) Remove the oil feed or oil scavenge tube end assemblies for examination.
  - (a) Unscrew the oil feed or scavenge adapter from the appropriate tube at No.5 vane.

- (b) Remove the slotted nut securing the oil feed or scavenge tube to the external duct on No.5 vane. Use the wrench spanner (Tool 1540) for the oil feed nut, and wrench (Tool 1533) for the scavenge nut.
- (c) Detach the oil feed or scavenge tube bush and clip assembly from the bracket on No.5 vane internal duct. Note the positions of the items removed.
- (d) Unscrew the tube union nut from the tube end assembly on the bearing housing. Use the cranked wrench spanner (Tool 1552) for the oil feed nut and wrench (Tool 1546) for the scavenge nut.
- (e) Carefully manipulate each tube away from the respective tube end assembly.
- (8) Remove the tube end assembly.
- (a) Unscrew the tube end assembly castellated nut. Use the cranked wrench spanner (Tool 1598) for the feed and scavenge.
- (b) Carefully withdraw the tube end assembly from the bearing housing.
- (c) Check the sealing surfaces for cleanliness.
- (d) Examine the sealing surfaces for damage.
- (e) Examine the threads for damage.
- (f) Correct minor damage if possible.
- (9) Assemble the appropriate oil feed or scavenge tube end unit to the bearing housing.

NOTE: The preparation procedure for a replacement oil feed tube end assembly is detailed after this procedure.

SUB-ASSEMBLY

**72-00-51**

OVERHAUL

- (a) If a replacement scavenge tube end unit (72-51-01/3-260) is to be installed, transfer the seal ring assembly (72-51-01/3-250) (if serviceable) from the rejected tube end assembly to the replacement unit. The small diameter seal ring is assembled between the two larger rings.
  - (b) Ensure that the open section of each ring is not aligned with the open section of an adjacent ring.
  - (c) Apply lubricant 'A' to the union nut thread.
  - (d) Screw the tube end assembly into position in the bearing housing. The scavenge unit is located at bottom position.
- (10) Prepare to install a replacement oil feed tube end assembly (72-51-01/3-210).
- (a) Carefully remove the lubricating nozzle from the unserviceable tube end assembly, and remove the seal ring assembly if serviceable.
  - (b) Assemble the seal ring assembly (72-51-01/3-200) to the replacement tube end assembly. The small diameter seal ring is assembled between the two larger rings.
  - (c) Ensure that the open section of each ring is not aligned with the open section of an adjacent ring.
  - (d) Apply lubricant 'A' to the oil lubricating nozzle and assemble it to the tube end assembly. Torque-tighten the nozzle to 50 lbf in. maximum (5,6 N.m) maximum.
  - (e) Ensure that a minimum clearance gap of 0.020 in. (0,508 mm) will be maintained between the face of the lubricating nozzle and the bottom of the locating bore in the front cover after tightening.
- (11) Install the oil feed tube end assembly.
- (a) Apply lubricant 'A' to the tube end assembly union nut thread. Screw the unit into position in the bearing housing.

SUB-ASSEMBLY

- (12) Connect the insulated tube assembly to the oil feed or scavenge tube end assembly.
- (a) Apply lubricant 'A' to the tube union nut thread and screw it on to the appropriate tube end assembly, hand-tight.
  - (b) Assemble the tube bush and clip assembly to the appropriate tube. Attach the feed tube to the small bracket on No.5 vane duct. Attach the scavenge tube to the large bracket on No.5 vane duct.
  - (c) Ensure that the nuts have a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m). Apply lubricant 'A' to the bolt threads and torque-tighten the nuts to 100 lbf in. (11,5 N.m).
  - (d) Torque-tighten the oil feed castellated nut to 460 lbf in. (52 N.m) using the wrench spanner (Tool 694) and adapter (Tool 695).
  - (e) Torque-tighten the oil feed tube union nut to 295 lbf in. (33 N.m) using the cranked wrench spanner (Tool 1552).
  - (f) Torque-tighten the oil scavenge castellated nut to 460 lbf in. (52 N.m) using wrench spanner (Tool 694) and adapter (Tool 695).
  - (g) Torque-tighten the oil scavenge tube union nut to 420 lbf in. (47 N.m) using the cranked wrench spanner (Tool 1546).
- (13) Assemble the slotted nut to the oil feed or scavenge tube protruding through No.5 vane.
- (a) Apply lubricant 'A' to the tube threads.
  - (b) Screw the slotted nut on to the tube end. Torque-tighten the oil feed tube nut between 280 and 310 lbf in. (31,6 and 35,0 N.m) using the spanner (Tool 1533).
  - (c) Torque-tighten the oil scavenge tube nut between 400 and 440 lbf in. (45,2 and 49,7 N.m) using the spanner (Tool 1540).

(14) Secure the oil feed or oil scavenge tube to the appropriate bracket at No.5 vane duct.

- (a) Assemble the securing items in the order noted during removal. Ensure that the nuts have a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m). Torque-tighten the nuts to 100 lbf in. (11,5 N.m).

P. Pressure Test After Rectification.

- (1) Connect the oil feed and scavenge hose adapter to the appropriate connection at No.5 vane.
- (2) Ensure that all traces of oil are removed from the vent tube and insulation blankets.
- (3) Pressure test the bearing housing assembly (Ref. para.H).
- (4) Remove the pressure test equipment and wire-lock the tubes (Ref. para.J).

Q. Rectify Oil Leakage From No.16 Labyrinth Ring.

- (1) Check the tightness of the nuts securing No.16 labyrinth ring to the bearing housing. Torque required is 100 lbf in. (11,5 N.m).
- (2) If leakage continues after the tightness check, remove the bearing housing blanks.
- (a) Switch OFF the circulating pump and oil heater.
- (b) Disconnect the pressure test equipment electrical plug from the mains supply.
- (c) OPEN the return stop valve.
- (d) Rotate the assembly stand to assist oil drainage from the bearing housing rear blank.
- (e) Open the drain tap on the rear blank and drain the oil into a clean container.
- (f) Support the bearing housing rear blank.

OVERHAUL

27. Assemble Engine Mounting Trunnions to Diffuser Case  
(Ref.Fig.523)

A. Prepare to Install Trunnions.

- (1) Install the plug (72-34-00/3-280) and sealing washer (72-34-00/3-290) in the tapping at vane No.7 trunnion location.
  - (a) Apply lubricant 'A' to the plug thread, assemble the washer to the plug and screw the plug into position in the diffuser case. Torque-tighten the plug to 355 lbf in. (40 N.m).
- (2) Assemble the elbow (72-34-00/3-300) to the location at No.7 vane.
  - (a) Apply lubricant 'C' to the securing bolts (72-34-00/3-310-320). Ensure that the bolts have a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m).
  - (b) Place the elbow in position on the diffuser case. The elbow outlet faces toward the bottom dead centre of the diffuser case.
  - (c) Retain the elbow with the securing bolts torque-tightened to 100 lbf in. (11,5 N.m).
  - (d) Temporarily assemble the keep plate (75-03-01/3-280) to the elbow with a bolt (75-03-01/3-270).
  - (e) Secure the hollow pin (75-03-01/3-260) to the keep plate and elbow with bolt (75-03-01/3-250).

B. Assemble Engine Trunnions.

NOTE: It is permissible to perform this operation following assembly of the CC0C to the diffuser case (Refer para.32.C.(7)).

- (1) Apply lubricant 'A' to bolts (71-20-00/1-40).

- (2) Insert the headless pins (71-20-00/1-70) in position in the diffuser case.
- (3) Assemble the mounting trunnions to the diffuser case ensuring that the headless pins locate freely.
- (4) Secure each headless pin in position with a siamese washer (71-20-00/1-50) retained by a bolt (71-20-00/1-40) positioned at each side of the pin location.
- (5) Screw the remaining bolts into position and torque-tighten all the bolts to 500 lbf in. (56,6 N.m).
- (6) Measure dimension B between the mounting trunnion and radius section of the diffuser case wall near the flange. A minimum gap greater than 0.008 in. (0,203 mm) must be maintained throughout this area.
- (7) Wire-lock the plug assembled under the left-hand trunnion location to the nearest trunnion securing bolt.
- (8) On engines to SB.71-8885-31 standard, apply heat resisting aluminium touch-up enamel (PL82) to the bolted flanges on the areas not protected by Sermetel W. Refer to Chapter 72-09-04 for procedure (Local Touch-Up).

28. Assemble External Blanks and Ducts to Diffuser Case  
(Ref.Fig.524 Sheet 1 of 2)

A. Assemble Air Duct Vane Covers.

- (1) Apply lubricant 'C' to bolts (72-34-00/3-230).
- (2) Place a cover (72-34-00/3-250) in position on No.2 and 8 air duct vane flanges and secure with bolts (72-34-00/3-230) and cup-lockwashers (72-34-00/3-240).
- (3) Torque-tighten the bolts to 100 lbf in. (11,5 N.m). Do not lock the washers at this stage.

B. Assemble Air Vent Duct to No.6 Vane.

- (1) Place the air duct (75-02-12/1-10B) SB.75-2 or (75-02-12/1-10A) Pre-SB.75-2 in position on No.6 vane.

- (2) Apply lubricant 'C' to securing bolts (75-02-12/1-20). Ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).
- (3) Place the brackets (75-02-12/1-30-40) in position on the air duct flange and secure with two bolts.
- (4) Assemble the securing bolts to the remaining holes in the air duct. Torque-tighten the bolts to 100 lbf in. (11,5 N.m) and wire-lock the bolts together in pairs.
- (5) Pre-SB.75-2. Apply lubricant 'A' to the threads of the union body situated on the duct (75-02-12/1-10A). Assemble the nut assembly (75-02-12/1-45A) to the union body and torque-tighten the nut between 140 and 160 lbf in. (15,8 and 18,1 N.m). Wire-lock the nut to the union body.

C. Blank Unused Igniter Ports.

- (1) Apply lubricant 'A' to the threads of blanking plugs (72-34-00/3-260).
- (2) Assemble a flat washer (72-34-00/3-270) to each blanking plug. Screw each plug into the diffuser case and torque-tighten to 505 lbf in. (57 N.m). Wire-lock each plug.

D. Blank Unused Fuel Sprayer Pad Locations.

NOTE: Refer to the IPC for details of alternative bolts and blanking covers.

- (1) Assemble blanking covers without brackets attached.
  - (a) Apply lubricant 'C' to bolts. Assemble a sealing washer (72-34-00/3-110) and blanking cover (72-34-00/3-90) to positions 9, 10, 11, 14, 15 and 16. Retain the blanks with bolts (72-34-00/3-60) torque-tightened to 210 lbf in. (24 N.m). Wire-lock the bolts together.

(2) Assemble components to position 12.

- (a) Apply lubricant 'C' to bolts. Assemble a sealing washer (72-34-00/3-110) with the blank cover/thermocouple housing (72-34-00/3-100). Position the bracket (72-34-00/3-85) on the blank cover and secure the assembly to the diffuser case with bolts (72-34-00/3-80). Torque-tighten the bolts to 210 lbf in. (24 N.m). Wire-lock the bolts together in pairs.
- (b) Assemble the union nut/blank ferrule assembly (72-34-00/3-170-180-190-200) to the blank cover. Apply lubricant 'A' to the threads. Torque-tighten the union nut to 240 lbf in. (27 N.m). Wire-lock the union nut to a cover bolt.
- (c) Insert the blanking cover (72-34-00/3-220) into the hole next to the installed cover. Apply lubricant 'C' to the securing bolts (72-34-00/3-210).
- (d) Ensure that the bolts have a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m). Secure the blanking cover with the bolts torque-tightened to 100 lbf in. (11,5 N.m). Wire-lock the bolts together.

(3) Assemble components to position 13.

- (a) Apply lubricant 'C' to bolts. Assemble a sealing washer (72-34-00/3-110) blanking cover (72-34-00/3-90) and bracket (72-34-00/3-40) to position 13. Retain the bracket with bolts (72-34-00/3-35 or 20). Secure the blanking cover at the remaining bolt positions with bolts (72-34-00/3-60 or 70). Torque-tighten the bolts to 210 lbf in. (24 N.m). Wire-lock the bolts together.

E. Assemble Blanking Plugs near Unused Fuel Sprayer Pads.

- (1) Apply lubricant 'C' to bolts. Ensure that the bolts have a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m).

OVERHAUL

Printed in England

- (2) Install the blanking plugs (72-34-00/3-150) near the unused sprayer pad positions 11, 13 and 14.
- (3) Secure each blanking plug at position 11 and 14 with two bolts (72-34-00/3-140) torque-tightened to 100 lbf in. (11,5 N.m).
- (4) Wire-lock each pair of bolts together.
- (5) Secure the blanking plug at position 13 with two bolts (72-34-00/3-120) and cupwashers (72-34-00/3-130).
- (6) Torque-tighten the bolts to 100 lbf in. (11,5 N.m).
- (7) Peen the cupwashers to lock the bolts.

F. Assemble duct at No.1 vane position.

- (1) Apply lubricant 'C' to bolts.
- (2) Position the duct (75-01-03/1-60) on the diffuser case and secure with 10 bolts (75-01-03/1-70B) (SB.75-2) or bolts and key washers (75-01-03/1-70A-80A) (Pre-SB.75-2). Torque-tighten the bolts to 100 lbf in. (11,5 Nm.).
- (3) Wire lock the bolts (SB.75-2) together in pairs. Lock the keywashers and bolts (Pre-SB.75-2).

G. Assemble duct at No.4 vane position.

- (1) Apply lubricant 'C' to bolts.
- (2) Position the duct (75-01-04/1-200) on the diffuser case.
- (3) Position the bracket (75-01-04/1-220) on the rear end of the duct flange and secure with bolts (75-01-04/1-210).
- (4) Secure the duct to the diffuser case with bolts (75-01-04/1-210). Torque-tighten the 10 bolts to 100 lbf in. (11,5 Nm.).
- (5) Wire lock the bolts together in pairs.

29. Assemble Fuel Sprayers to Diffuser Case  
(Ref.Fig.524 Sheet 2 of 2)

A. Assemble Sprayers.

CAUTION: EXERCISE GREAT CARE WHEN ASSEMBLING SPRAYERS.  
DO NOT APPLY FORCE TO TUBE SECTIONS, DAMAGE  
TO TUBES COULD OTHERWISE RESULT.

- (1) Ensure that all sprayers have been functionally tested and certified satisfactory. Remove the protectors from the fuel outlet ends of the sprayers, then ensure thorough cleanliness and absence of damage.
- (2) Apply lubricant 'C' to the sprayer securing bolts (73-12-05/1-20, 1-30, 1-40) and jointing compound 'A' to the sealing joints on the fuel sprayers and CCOC. Insert sprayers into the position A, B and C (Ref.Fig.538), and assemble brackets and securing bolts as follows.
  - (a) Assemble a bracket (73-12-05/1-60) to the sprayer flange at position A and secure it with two bolts (73-12-05/1-20).
  - (b) Assemble a bracket (73-12-05/1-50) to the sprayer flange at position B and secure it with two bolts (73-12-05/1-30).
  - (c) Assemble a bracket (73-12-05/1-70) to the sprayer flange at position C and secure it with two bolts (73-12-05/1-40).
- (3) Insert sprayers into the remaining locations and secure with bolts (73-12-05/1-20).
- (4) Torque-tighten all the fuel sprayer securing bolts to 100 lbf in. (11,5 N.m), then wire-lock the bolts together in pairs. Ensure that protectors are assembled to the thread sections of the sprayers.

30. Transfer Diffuser Case Assembly to Final Assembly Stand

A. Remove Diffuser Case from Assembly Stand (Ref.Fig.525).

- (1) Rotate the assembly stand (Tool 1160) until the bearing support is uppermost and vertically positioned.
- (2) Assemble the lifting fixture (Tool 1659) to the bearing support.
  - (a) Align the top position of the lifting fixture flange with the top of the bearing support.
  - (b) Carefully place the lifting fixture on the bearing support flange ensuring that the bolts and dowels engage freely.
  - (c) Secure the lifting fixture with nuts.
  - (d) Attach a crane hoist to the lifting fixture and carefully apply sufficient lifting force to support the diffuser case when it is released from the assembly stand.
- (3) Remove the diffuser case from the assembly stand.
  - (a) Prepare a suitable flat surface beneath the assembly stand to accept the diffuser case.

OVERHAUL

- (b) Release the lever clamps securing the diffuser case to the assembly stand ensuring that the clamps are fully retracted.
- (c) Carefully lower the diffuser case on to the prepared flat surface then remove the crane hoist.
- (d) Rotate the assembly stand away from the diffuser case. Attach the crane hoist to the lifting fixture.
- (e) Carefully raise the diffuser case in readiness for transfer to the assembly stand.

B. Assemble the Diffuser Case in Assembly Stand.

- (1) Align the engine mounting trunnions with the assembly stand supports. Lower the diffuser case on to the stand.
- (2) Secure the diffuser case flange to the assembly stand.
- (3) Remove the crane hoist and lifting fixture from the bearing support.

31. Assemble Shroud to Bearing Support (Ref.Fig.526)

A. Prepare Shroud.

- (1) Assemble 24 bolts (72-51-02/1-240) to the outer flange of the shroud (72-51-01/5-20), ensuring that the bolts protrude rearward and the flat sections of boltheads locate on the machined section at the base of the bolt flange.
- (2) Using the assembly sleeve (Tool 1322) secure each bolt with a retaining ring (72-51-02/1-231).
- (3) Freeze theoulderer pin (72-51-02/1-330) using a suitable freezing agent.
- (4) Fully insert the pin into the rear flange of the shroud. Protective gloves must be worn when handling frozen components.

B. Assemble Shroud.

- (1) Place the shroud in position on the bearing support ensuring that the oil transfer tube in the bearing support flange engages correctly with the location in the shroud. Place the insulation blanket (72-51-01/5-10) over the shroud and locate it on the seven bolts protruding from the bearing support.
- (2) Apply lubricant 'C' to the bolt threads. Ensure that the bolts have a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m).
- (3) Secure the shroud and insulation blanket with self-locking nuts (72-51-01/4-40 and 70). Torque-tighten the nuts to 100 lbf in. (11,5 N.m).
- (4) Secure the bolts each side of the oil transfer tube/flexible drains tube position with two nuts (72-51-01/4-100). Torque-tighten the nuts to 100 lbf in. (11,5 N.m).

32. Assemble Combustion Chamber Outer Case to Diffuser Case

A. Prepare CCOC (Ref.Fig.527 and 527A).

- (1) On engines to Pre-S.B.72-75 standard, install pins and blanking plates.
  - (a) Shrink the locating pin and the straight headless pin (72-42-01/2-360-370) in a freezing agent.
  - (b) Install the locating pin (2-360) in the top of the CCOC front flange.
  - (c) Install the headless pin (2-370) in the top of the CCOC rear flange.
  - (d) Install blanking plates.
    - (i) Apply jointing compound 'A' to abutment surfaces of the blanking plates (72-42-01/2-400).
    - (ii) Assemble the blanking plates to the redundant thermocouple locations and retain them with bolts and nuts (72-42-01/

2-390-380) with lubricant 'C' applied. Ensure that the nuts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m), then torque-tighten to 100 lbf in. (11,5 N.m).

- (2) Install pins (72-42-01/2-80) to the anti-icing valve location in the side of the CCOC. Use a suitable freezing agent to shrink the pins, then insert the pins into the anti-icing valve mounting location.
- (3) Install mounting bosses (72-42-01/2-250) or blanking plate (72-42-01/2-110) at inspection port locations.

NOTE: If vane 13 is of the single inspection port type, install blanking plate in lieu of lower mounting boss.

- (a) Install mounting boss (72-42-01/2-250) at both inspection port locations.
  - (i) Apply jointing compound 'A' to abutment surfaces of the boss/CCOC and gasket SB.72-58 (72-42-01/2-255). Apply lubricant 'C' to bolts.
  - (ii) Place the mounting boss and gasket in position and retain with four bolts and nuts (72-42-01/2-240-230). Ensure that the nuts have a locking (run-down) torque of 10 lbf in. (1,1 N.m) then torque-tighten to 100 lbf in. (11,5 N.m).
  - (iii) Temporarily assemble the cover plate (72-42-01/2-210), gasket SB.72-58 (72-42-01/2-225) and bolts (72-42-01/2-200) to the mounting boss. Attach the flanged sealing bar externally to the mounting boss in readiness for later use.
- (b) Install blanking plate (72-42-01/2-110) in lieu of lower mounting boss.
  - (i) Apply lubricant 'C' to bolts (Ref.70-00-01, Servicing and Storage of Materials).

OVERHAUL

sneema

- (ii) Position the plate over the inspection port and retain with four bolts and nuts (72-42-01/2-100-90). Ensure that the nuts have a locking (run-down) torque of 10 lbf in. (1,1 N.m) then torque-tighten to 100 lbf in. (11,5 N.m).
- (4) Install mounting blocks (72-42-01/2-30) at both thermocouple locations.
  - (a) Apply jointing compound 'A' to abutment surfaces. Place the mounting block in position on the CC0C and place keywasher (72-42-01/2-20) inside the CC0C in line with the mounting block bolt-holes.
  - (b) Apply lubricant 'A' to the bolts (72-42-01/2-10), then insert the bolts through the keywasher and screw into the mounting block. Ensure that the keywasher does not obstruct the thermocouple hole.
  - (c) Torque-tighten the bolts to 100 lbf in. (11,5 N.m), then lock the keywashers.
- (5) On engines to SB.72-8605-276 standard, install the two blanking covers (72-42-01/2A-892) on the CC0C.
  - (a) Apply lubricant C to the bolts (72-42-01/2A-891) and secure the blanking covers.
  - (b) Torque-tighten the bolts (72-42-01/2A-891) to 100 lbf in. (11,5 N.m).
  - (c) Wire-lock the bolts together in pairs.

B. Assemble Saddle Plates and Igniter Adapters to CCOC  
(Ref.Fig.527).

- (1) Ensure thorough cleanliness of all components.  
Apply lubricant 'A' to securing screws and  
lubricant 'C' to bolts.

NOTE: This procedure applies only to engines with CCOC  
incorporating bolted on igniters and pilot fuel  
sprayer mountings.

- (2) Position the saddle plates inner (72-42-01/2A-860)  
on the inner surface of the CCOC.
- (3) On engines to Pre-SB.72-58 standard apply jointing  
compound 'A' to abutment surfaces of saddle plates  
outer (72-42-01/2A-840) and CCOC.
- (4) On engines to SB.72-58 standard interpose a gasket  
(72-42-01/2A-850) between each saddle plate outer  
and CCOC.
- (5) Position the saddle plates outer on the CCOC and  
secure to the saddle plates inner with screws  
(72-42-01/2A-830) fully tightened. Peen the screws  
to lock (Ref. Standard Practices 72-09-00).

OLYMPUS 593

MK.610-14-28  
OVERHAUL

sneema

- (6) Assemble igniter adapters to saddle plates.
  - (a) On engines to Pre-SB.72-58 standard apply jointing compound 'A' to abutment surfaces of adapters (72-42-01/2A-810) and saddle plates outer.
  - (b) On engines to SB.72-58 standard interpose a gasket (72-42-01/2A-820) between each adapter and saddle plate outer.
  - (c) Secure the adapters with bolts (72-42-01/2A-800) torque tightened to 100 lbf in. (11,5 N.m). Wire-lock the bolts together in pairs.

C. Assemble CCOC to HP Compressor Diffuser Case (Ref.Fig.528).

- (1) Secure the multiple leg sling (Tool 1190) to the rear flange of the CCOC, then attach the crane hoist and position the unit in readiness for assembly to the diffuser case.
- (2) Apply jointing compound A to the abutment surfaces of the diffuser case and CCOC flange.
- (3) Align the TOP mark on the CCOC with the TOP mark on the diffuser case. Align the bolt-holes in the flanges and the pin in the CCOC with the hole near the top position in the diffuser flange.
- (4) Lower the CCOC into position on the diffuser case flange.
- (5) Apply lubricant 'A' to the flange retaining bolts.
- (6) Assemble brackets to the joint flanges.

NOTE: Boltheads are to be positioned on the CCOC flange side of the assembly.

CAUTION: EXERCISE CARE AND ENSURE D HEAD BOLTS FIT TIGHTLY AGAINST LOCATING SHOULDER TO AVOID DAMAGE.

- (a) Refer to Fig.528 and, in conjunction with Table 501, assemble and retain the brackets to the flanges.

(7) Assemble Engine Trunnions (Ref. Fig.523)

NOTE: If the engine trunnions are already assembled to the diffuser case (Ref. para 27A and 27B), proceed to para.(8).

- (a) Ensure the plug and sealing ring (72-34-00/3-280-290) and the elbow and retaining bolts (72-34-00/3-310-320) are assembled at vane No.7 trunnion location (Ref. para.27A(1) and (2)).
- (b) Apply lubricant 'A' to bolts (71-20-00/1-40).
- (c) Insert the headless pins (71-20-00/1-70) in position in the diffuser case.
- (d) Assemble the mounting trunnions to the diffuser case ensuring that the headless pins locate freely.
- (e) Secure each headless pin in position with a siamese washer (71-20-00/1-50) retained by a bolt (71-20-00/1-40) positioned at each side of the pin location.
- (f) Screw the remaining bolts (71-20-00/1-40) into position and torque tighten all the bolts to 500 lbf in. (56,6 Nm.).
- (g) Measure dimension B between the mounting trunnion and the radius section of the diffuser case wall near the flange. A minimum gap greater than 0.008 in. (0,203 mm) must be maintained throughout this area.
- (h) Wire-lock the plug assembled under the left-hand trunnion location to the nearest trunnion securing bolt.
- (j) On engines to SB.71-8885-31 standard, apply heat resisting aluminium touch-up enamel (PL82) to the bolted flanges on the areas not protected by Sermetel W. Refer to Chapter 72-09-04 for procedure (Local Touch-up).

OVERHAUL

- (8) Assemble bolts and nuts at engine mounting trunnion rear flange positions.

**CAUTION:** EXERCISE CARE AND ENSURE D HEAD BOLTS FIT TIGHTLY AGAINST LOCATING SHOULDER TO AVOID DAMAGE.

- (a) Ensure that the nuts have minimum locking (run-down) torque of 20 lbf in. (2,3 N.m).
- (b) Assemble bolts and nuts (72-42-01/3-260-250) at the right-hand engine mounting trunnion position (hole numbers 32 to 42 inclusive).
- (c) Assemble bolts and nuts (72-42-01/5-90-80) at the left-hand engine mounting trunnion position (hole numbers 104 to 114 inclusive).

- (9) Assemble bolts to remaining locations in the flanges.

**CAUTION:** EXERCISE CARE AND ENSURE D HEAD BOLTS FIT TIGHTLY AGAINST LOCATING SHOULDER TO AVOID DAMAGE.

- (a) Ensure that the nuts have a minimum locking (run-down torque of 10 lbf in. (1,1 N.m).
- (b) Assemble the bolt and nut (72-42-01/3-450-20) to hole No.60.
- (c) Assemble the bolts and nuts (72-42-01/4-150-140) to holes No.79 and 80.
- (d) Assemble the bolts and nuts (72-42-01/3-30-20) to the remaining positions.

- (10) Torque-tighten flange nuts.

- (a) Torque-tighten the nuts at the mounting trunnion positions (hole numbers 32 to 42 inclusive and 104 to 114 inclusive) to 250 lbf in. (28 N.m).
- (b) Torque-tighten the nuts at all other positions to 120 bf in. (13,6 N.m).
- (c) Allow a period of ten minutes to elapse after torque-tightening the complete assembly, then torque check all nuts and ensure that torque tightness as detailed is maintained.

33. Prepare HP Nozzle Vane Support Cone for Assembly

A. Assemble Bolts and Pins (Ref.Fig.529).

- (1) Install the 24 bolts (72-51-02/1-190) in to the rear flange of the support cone. Ensuring that the flat edge section of each bolthead locates correctly and the bolts protrude rearwards through the flange.
- (2) Use the assembly sleeve (Tool 1321) to assemble the retaining rings (72-51-02/1-180) to the bolts.
- (3) Using protective gloves and a suitable freezing agent, freeze the 12 shoulder pins (72-51-02/1-70), then assemble them to the front flange outer of the support cone.

34. Calculate Thickness of HP Nozzle Vane Support Cone Adjusting Washer and 19 to 23 Labyrinth Seal Adjusting Washer

A. Temporarily Assemble Abutment Segments (Ref.Fig.529).

- (1) Assemble four abutment segments (72-42-01/6-190A) Pre-SB.72-7856-179 or (72-42-01/6-190B) SB.72-7856-179 at equally spaced positions in the CCOC internal machined recess.
  - (a) Position each segment with the right angled flanged section facing downward. Secure each segment with two bolts (72-42-01/6-180) inserted from the outside of the CCOC. Retain each bolt with a special nut (72-42-01/6-170).
  - (b) Check the gap between the top edge of each segment and the recessed section in the CCOC to ensure that the segments are evenly located.

B. Support Cone Adjusting Washer Measuring Procedure (Ref. Fig.529).

**NOTE:** Ensure that the adjusting washer range is 0.004 in. (0.101 mm) thickness increments SB.72-86.

- (1) Check and record the following dimensions.
  - (a) CCOC flange face to the underside of each abutment segment. Dimensions must be within 0.002 in. (0.051 mm) variation. Record as dimension A.
  - (b) CCOC flange to the adjusting washer locating face on the bearing support. Record as dimension B.

- (2) Obtain the Set Gap dimension from the Fits and Clearance Schedule 72-51-02 F.C.S.236.
  - (3) Using the following formula, calculate the required adjusting washer thickness. Thickness of washer C =  $B - (A + \text{Set Gap dimension})$ . Record the washer thickness.
  - (4) Select an adjusting washer of calculated thickness C from the range (72-51-01/5-100 to 185 SB.72-86 standard) (72-09-21 Repair, Fig.417) and place it in position on the bearing support.
  - (5) Remove the four abutment segments.
- C. Measuring Procedure 19 to 23 Labyrinth Seal Adjusting Washer (Ref.Fig.529).
- NOTE: If SB.72-86 is incorporated, the thickness of the adjusting washers is in 0.004 in. (0,101 mm) increments.
- (1) Ensure that the previously calculated support cone adjusting washer is in position on the bearing support.
  - (2) Measure and record the dimension from the rear face of the support cone adjusting washer, to the rear face of the shroud. Record as dimension D.
  - (3) Obtain the Set Gap dimension from the Fits and Clearance Schedule 72-51-01 F.C.S.262.
  - (4) Using the following formula, calculate the required adjusting washer thickness. Thickness of washer E =  $\text{Set Gap dimension} - D$ . Record the washer thickness.
  - (5) Select an adjusting washer of calculated thickness E from the range (72-51-01/5-200 to 310 SB.72-86 standard) (72-09-21 Repair, Fig.418) and place it in position on the shroud.

### 35. Assemble HP Turbine Nozzle Vanes to Combustion Chamber

#### A. Prepare Combustion Chamber (Ref.Fig.530).

- (1) Attach the multiple leg sling (Tool 903) to the combustion chamber, raise the assembly and assemble the protector (Tool 3131) to the front end of the combustion chamber.

- (2) Lift the assembly onto a prepared surface or pallet (Tool 1014) then remove the lifting equipment.

B. Pressure Wash Turbine Nozzle Vanes (Ref.Fig.531).

NOTE: The following procedure is a non-calibrated witness check requiring equipment capable of delivering a low pressure flow of filtered paraffin through an outlet hose capable of connecting to the pressure wash fixture block (Tool 246).

- (1) Assemble each vane in turn to the pressure wash fixture (Tool 245).
- (2) Place the pressure wash fixture block (Tool 246) in position to seal the nozzle vane. Hand-tighten the screw clamp to hold the block and vane firmly in position.
- (3) Connect the pressure wash equipment hose union to the union on the fixture block and securely tighten.
- (4) Place a suitable oil splash protection screen around the nozzle vane pressure wash fixture assembly.
- (5) Operate the pressure wash equipment and adjust to a flow pressure setting of 5 psi approximately. Thoroughly flush out each nozzle vane and ensure that oil flows freely through each cooling hole.
- (6) Investigate cooling hole obstruction and rectify or reject the nozzle vane.
- (7) Switch off the pressure wash equipment and remove the nozzle vane.
- (8) Place each nozzle vane into its container (Tool 1372).

C. Separate and Identify Nozzle Vanes.

- (1) Separate the nozzle vanes (Ref.Table 502).
  - (a) If replacement units are to be installed, lightly vibro-etch the appropriate assembly position identification number on the outer section of each unit between the vane ends.

- (2) Mark the nozzle vane positions on the combustion chamber (Ref.Fig.532).
- (a) Note the TOP position on the combustion chamber as this is the position for No.1 nozzle vane.
  - (b) Commencing at No.1 position, numerically identify the vane positions on the combustion chamber in a clockwise order. Use an approved non-permanent marking agent.
- D. Assemble Nozzle Vanes for Dimensional Checks (Ref.Fig.532).
- (1) Assemble the retaining ring support rods (Tool 1946) to the combustion chamber.
- (a) Position each support rod on the inner surface of the combustion chamber. Insert the rod section through a cooling hole near the rear end of the combustion chamber, press the tapered plug section of the support rod into a cooling hole and lock the cap screw.
- (2) Assemble the retaining ring (72-51-02/1-10) to the combustion chamber.

**NOTE:** Prior to assembly, ascertain that the retaining ring is compatible with the standard of HP nozzle vane support cone to be fitted (72-51-02/1-10, -150).

- (a) Place the retaining ring in position on the combustion chamber and support rods.

NOTE: On retaining rings that incorporate captive securing nuts, ensure the ring is positioned with the captive nuts facing downwards.

CAUTION: MAINTAIN NOZZLE VANES IN COMPLETE SETS AND TO THE SAME S.B. STANDARD.

- (3) Commencing at No.1 position assemble the odd numbered vanes only to the combustion chamber. Insert the vane lugs into the retaining ring slots. Ensure that each vane moves freely when in position and that vane No.15 is installed at an inspection port location.

E. Temporarily Assemble HP Nozzle Vane Support Cone to Combustion Chamber (Ref. Fig.533).

- (1) Install the support cone.

- (a) Press each nozzle vane fully toward the centre of the assembly to ensure engagement with the support cone.
- (b) Attach the multiple leg sling (Tool 1155) and crane hoist to the support cone. Carefully lower the support cone evenly into position on the combustion chamber ensuring that the locating pins fully engage and that the nozzle vanes engage correctly with the support cone flange.
- (c) Remove the multiple leg sling and crane hoist. Apply lubricant 'C' to new bolts (72-51-02/1-20 and 160). Screw the bolts into the holes inside the support cone to engage with the retaining ring.

NOTE: The new bolts assembled at this stage can be used for the final assembly of the support cone, Ref. Para. 35.J.

- (d) Ensure that the bolts have a minimum locking (run-down) torque of 6.5 lbf in. (0,73 N.m). Torque-tighten the bolts to 210 lbf in. (24,0 N.m) using the cranked ring wrench (Tool 1556). On completion of torque-tightening ensure that the nozzle vanes move freely in position.

F. Measure Turbine Entry Duct Gaps (Ref. Fig.533).

- (1) Measure the gap of each nozzle vane.
  - (a) Press the nozzle vane as far as possible toward the centre of the assembly and at the same time lift the vane as far rearwards as possible. Firmly hold the vane in the described position and measure the gap formed at position A. When measuring the gap ensure that the outer gap has clearance. Record the gap measured for each vane.
  - (b) Check that the clearances obtained are within the limits quoted in Fits and Clearances Schedule (72-40-00 F.C.S.175).

G. Assemble Complete Nozzle Vane Assembly (Pre-S.B.72-124).

- (1) Use the cranked ring wrench (Tool 1556) to remove the bolts securing the support cone.
- (2) Assemble the multiple leg sling (Tool 1155) to the cone and carefully remove the cone from the combustion chamber. Do not remove the installed nozzle vanes.
- (3) Commencing at No.2 position assemble the even numbered vanes to the combustion chamber. Insert the vane lugs into the retaining ring slots. Ensure that each vane moves freely when in position and that vane No.14 is installed at an inspection port location.

H. Assemble Complete Nozzle Vane Assembly and Sealing Strips (S.B.72-124 Standard).

- (1) Using the cranked ring wrench (Tool 1556) remove the bolts securing the support cone. Assemble the multiple leg sling (Tool 1155) to the cone and carefully remove the cone from the combustion chamber.
- (2) Ensure that the retaining ring top position is in line with top position on the combustion chamber, support rods must remain in position.
- (3) Assemble sealing strips to nozzle vanes.

CAUTION: EXERCISE CARE TO PREVENT SEALING STRIPS FROM FALLING INTO COMBUSTION CHAMBER.

- (a) Assemble a sealing strip (72-51-02/1A-55) to the outer location of the inspection port nozzle vane (No.14) (72-51-02/1A-60C). The sealing strip is assembled to the inspection port edge of the nozzle vane. Assemble a sealing strip (72-51-02/1A-57) to the inner location of the vane. This strip is assembled in line with the previous strip.
- (b) Carefully place the nozzle vane in position on the combustion chamber at the inspection port location. Ensure that the nozzle vane lug is engaged with the retaining ring. Carefully engage nozzle vane (No.15) (72-51-02/1A-50C) with (No.14) nozzle vane sealing strips. Ensure that the sealing strips are fully inserted in the vanes and that both vanes are assembled to the retaining ring and combustion chamber.

- (c) Assemble a sealing strip (72-51-02/1A-45) to the outer location of the installed nozzle vane (No. 15) and a sealing strip (72-51-02/1A-47) to the inner location. Engage nozzle vane (No.16) (72-51-02/1A-40) with the assembled nozzle vane sealing strips and simultaneously assemble it to the retaining ring and combustion chamber.
- (d) Continue the sealing strip and nozzle vane assembly procedure in numerical order in a clockwise direction until a complete assembly is achieved. Ensure that sealing strips are assembled to the last position between vanes 13 and 14. If the last vane is difficult to install the following procedure will assist.
  - (i) Remove the retaining ring support rods.
  - (ii) Carefully press the retaining ring downward evenly to disengage it from the nozzle vanes lugs, ensure that the sealing strips are not dislodged. The retaining ring will drop slightly into the combustion chamber.
  - (iii) Close the gaps between each vane to allow maximum space for the last nozzle vane. Install the remaining sealing strips and carefully manipulate the last vane into position.
  - (iv) Ensure that the inspection port vanes are in line with the inspection ports in the combustion chamber, also that the retaining ring and combustion chamber top positions align.
  - (v) Evenly raise the retaining ring and engage it with the nozzle vanes lugs.

**NOTE:** The retaining ring securing bolts provide an effective lifting facility.
  - (vi) When the retaining ring and nozzle vane lugs are fully engaged, assemble the retaining ring support rods (Tool 1946) to the combustion chamber.
- (d) Examine each nozzle vane to ascertain that the complete set of sealing strips is correctly installed.

J. Final Assembly of HP Nozzle Vane Support Cone to Combustion Chamber.

(1) Install the support cone.

- (a) Press each nozzle vane fully toward the centre of the assembly to ensure engagement with the support cone.
- (b) Attach the multiple leg sling (Tool 1155) and crane hoist to the support cone. Carefully lower the support cone evenly into position on the combustion chamber, ensuring that the locating pins fully engage and that the nozzle vanes engage correctly with the support cone flange. Remove the multiple leg sling and crane hoist.
- (c) Ensure that the bolts (72-51-02/1-20 and 1-60) are new (Ref. Service Bulletin OL.593-72-8825-314), and apply lubricant 'C' to the bolts. Screw the bolts into the holes inside the support cone to engage with the retaining ring. Ensure that the bolts have a minimum locking (run-down) torque of 6.5 lbf in. (0,73 N.m). Torque-tighten the bolts to 210 lbf in. (24,0 N.m) using the cranked ring wrench (Tool 1556).
- (d) On completion of the torque-tightening, ensure that all nozzle vanes move freely in position.

36. Assemble Combustion Chamber and Nozzle Vane Assembly to CCOC  
(Ref.Fig.534).

A. Prepare Assembly.

- (1) Assemble the multiple leg sling (Tool 1155) to the nozzle vanes support cone. Ensure that the tool is correctly installed (Ref.Fig.533). Remove the protector from the front end of the combustion chamber.
- (2) Ensure that the adjusting washer of the previously calculated thickness is on the bearing support.

B. Install Assembly.

- (1) Align the top of the combustion chamber with the TOP of the CCOC, also align the bottom igniter hole in the combustion chamber with the bottom hole in the CCOC. Carefully mark the top position inside the combustion chamber.

- (2) Gently lower the combustion chamber into the CCOC until the support cone is almost in contact with the bearing support bolts. Ensure that the bearing support bolts and pins are aligned with the holes in the support cone flange. Lower the combustion chamber assembly into position. Check the alignment of the igniter ports through the CCOC also check the alignment of the inspection probe ports through the CCOC. Remove the multiple leg sling.
  - (3) Ensure that protectors (Tools 1002-1003) are in position on the bearing support to prevent nuts from falling into the bearing support. Secure the support cone to the bearing support with self-locking nuts (72-51-01/5-50). Apply lubricant 'C' to the nuts. Do not fully tighten the nuts at this stage.
- C. Install Nozzle Vane Abutment Segments (Ref.Fig.535).
- (1) On engines to Pre S.B.72-7856-179 standard, assemble abutment segments to CCOC.
    - (a) Assemble two segments (72-42-01/6-190A-195) to CCOC with their abutting edges positioned at approximately bottom dead centre of the case.
    - (b) Assemble a half segment (72-42-01/6-160A-165) to the CCOC to abut the segment installed to the left of the centre line.
    - (c) Assemble a half segment to the CCOC to abut the segment installed to the right of the centre line.
    - (d) Assemble abutment segments (72-42-01/6-190A-195) to the CCOC at remaining locations.
  - (2) On engines to SB.72-7856-179 standard, assemble abutment segments to CCOC.
    - (a) Assemble the two half segments (72-42-01/6-160B) to their locations the 8 o'clock position.

(b) Assemble abutment segments (72-42-01/6-190B) to the CCOC at remaining locations.

(3) Secure abutment segments to CCOC.

NOTE: There are several S.B. standards applicable to the securing of abutment segments to the CCOC. The following details apply to the preferred standard (S.B.72-8743-280).

(a) Apply lubricant 'A' to the bolts (72-42-01/6-180).

(b) Retain abutment segments, except those aligned with nozzle vane locking pins at positions 1 to 5 and 29 to 32 (Ref.Fig.535) with the bolts and nuts (72-42-01/6-140-145-170-175) or, the bolts, spacers (72-42-01/6-157-197) and nuts. Lightly tighten the bolts.

(c) Torque-tighten each bolt to 100 lbf in. (11,5 N.m).

NOTE: Segments at positions 1 to 5 and 29 to 32 are secured later in the procedure.

(4) Check the gap between the top of each segment and the recessed section in the CCOC to ensure that the segments are evenly located.

D. Install and Secure HP Turbine Nozzle Vanes to CCOC (Ref. Fig.534, 535 and 536).

(1) Identify Nozzle Vane Pin Positions.

(a) Use an approved non-permanent marking substance. Identify the nozzle vane securing pin positions 1 to 32 in a clockwise direction commencing at the top position as viewed from the rear of the CCOC.

(3) Secure nozzle locking pins to CC0C.

(a) Ensure that the bolts (72-42-01/6-10-30-70-120) are new (Ref. SB.72-8648-215), then apply lubricant 'C' to the bolts. Secure each pin with a bolt torque-tightened to 100 lbf in. (11,5 N.m).

(4) Assemble retention brackets to nozzle vane locking pins and abutment segment retaining bolts (Ref. Fig.536).

NOTE: There are various S.B. standards applicable to the securing of nozzle vane locking pins and abutment segments at the top nine locations of the CC0C. The details for securing the segments and pins given subsequently, apply to the preferred standard.

(a) The following procedure applies to each of nine locations (i.e. vane locking pin positions 1 to 5 and 29 to 32) at the top of the combustion chamber outer case on engines to S.B.72-8571-283 standard.

(i) Establish whether Part 1 or Part 2 of the S.B. is to be incorporated.

(ii) Apply lubricant 'A' to retaining bolts (72-42-01/6-181).

(iii) Hold the pin retention bracket (72-42-01/6-225 or 235) in the position shown with the elongated hole aligned with the threaded hole in the vane locking pin.

(iv) Locate the bolt (72-42-01/6-181) through the smaller hole of the bracket and the abutment segment, engage the nut (72-42-01/6-140-145-175) and lightly tighten the bolt.

SUB-ASSEMBLY

- (v) To maintain alignment of bolt locations while torque-tightening the abutment segment retaining bolt, engage the bolt retention bracket (72-42-01/6-220 or 230) with the pin retention bracket, then position the bolt retention bracket clear of the abutment segment retaining bolt. Attach both brackets to the locking pin with the bolt (6-200) lightly tightened with lubricant 'C' applied to threads.
  - (vi) Torque-tighten the abutment segment retaining bolt to 100 lbf in. (11,5 N.m).
  - (vii) Slacken the bolt attaching both brackets to the locking pin, reposition the bolt retention bracket to engage the head of the abutment segment retaining bolt, then secure both brackets to the locking pin with the bolt (6-200) torque-tightened to 100 lbf in. (11,5 N.m).
- (5) Assemble the following items to the nozzle vane pins.
- (a) Apply lubricant 'A' to the nuts (72-41-01/6-50-90).
  - (b) At positions 6,8,10,24,26 and 28 place a distance piece (72-42-01/6-60) over the projecting thread of each pin and secure it with a nut (72-42-01/6-50).
  - (c) Ensure that the nuts have a minimum locking (run-down) torque of 20 lbf in. (2,3 N.m). Torque-tighten the nuts to 250 lbf in. (28 N.m).
  - (d) At position 12, assemble a distance piece (72-42-01/6-110) over the thread of the pin, then, with lubricant 'A' applied, screw the pin support (72-42-01/6-100) onto the pin and torque-tighten to 210 bf in. (24 N.m).
  - (e) Attach the nut (72-42-01/6-90) to the pin support for use later in the procedure.

- (6) Visually check alignment of the following ports:
  - (a) Thermocouples.
  - (b) Engine igniters.
  - (c) Fuel sprayers.
- (7) Install flanged sealing bar (72-42-01/2-140).
  - (a) Apply jointing compound 'A' to abutment surfaces and lubricant 'C' to securing bolts.
  - (b) Insert the flanged sealing bar into the inspection port between nozzle vanes 14 and 15.
  - (c) Secure the cover plate (72-42-01/2-130) to the flanged sealing bar with two bolts (72-42-01/2-120).
  - (d) Torque-tighten the bolts to 100 lbf in. (11,5 N.m) and wire-lock the bolts together.
- (8) On satisfactory completion of alignment checks, wire-lock the bolts securing abutment segments and nozzle vanes.
  - (a) At nozzle locking pin locations 1 to 5 and 29 to 32 wire-lock the bolts to the brackets as shown (Ref.Fig.536).
  - (b) At location 12 wire-lock together, the pin support, the nozzle locking pin retaining bolt and the abutment segment retaining bolt.
  - (c) At remaining locations wire-lock the nozzle locking pin retaining bolt to the abutment segment retaining bolt as shown (Ref.Fig.535).

- (9) Ensure that a complete set of locknuts (72-51-01/5-50) secures the support cone to the bearing support.

- (a) Ensure that the locknuts have a minimum locking (run-down) torque of 20 lbf in. (2,3 N.m). Torque-tighten the locknuts to 210 lbf in. (24 N.m). Remove the protectors from the bearing support.

### 37. Finally Assemble No.19 to 23 Labyrinth Seal Housing

#### A. Prepare to Assemble Housing.

- (1) Ensure that the adjusting washer of the previously calculated thickness is in position on the shroud. Ensure that the extraction holes in the washer align with the corresponding sections on the shroud flange.
- (2) Apply lubricant 'C' to the bolt threads. Ensure that the locknuts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).

#### B. Assemble Housing.

- (1) Place the labyrinth seal housing in position and ensure that it locates fully on the adjusting washer and support cone.
- (2) Measure and record the minimum clearance between No.19 labyrinth seal and the shroud insulation blanket, which must not be less than 0.390 in. (9,906 mm). Dimension F (Fig.529).
- (3) Secure the labyrinth seal housing to the shroud with locknuts (72-51-02/1-220). Torque-tighten the nuts to 100 lbf in. (11,5 N.m).

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (4) Assemble the retaining plate (72-51-02/1-200) to the labyrinth seal housing at the nozzle vane support cone location. Secure the retaining plate with locknuts (72-51-02/1-170) with lubricant 'C' applied. Torque-tightened to 100 lbf in. (11,5 N.m).
- (5) Place the protector (Tool 913) over the labyrinth housing and nozzle vanes.

38. Deleted

39. Assemble Pilot Fuel Sprayers and Engine Igniter Plugs to CC0C

A. Prepare to Assemble Pilot Fuel Sprayers (Ref.Fig.537).

- (1) Examine all components for cleanliness and absence of damage. Ensure that all the sprayers have been functionally tested and certified satisfactory.
- (2) Apply lubricant 'C' to securing bolts (73-12-07/1-20 or 1-21).
- (3) Assemble the fuel transfer tube (73-12-07/1-50) to each sprayer (73-12-07/1-10). Assemble a protector to the threaded section of the sprayer to prevent the transfer tube from becoming dislodged and to exclude foreign matter.

B. Fuel Pressure Atomizing (Pilot) Nozzle Assembly Adjusting Washer Thickness Measuring Procedure (Ref.Fig.537).

NOTE: Pilot nozzle assemblies to Pre and S.B.73-12 and Pre and S.B.73-13 are all installed similarly.

NOTE: Correct penetration of the pilot nozzle is normally achieved by the use of an adjusting washer, but failure to obtain sufficient nozzle penetration will necessitate compliance with S.B. 73-8527-68. Where the procedures are affected by the Service Bulletin standard, the differences are detailed.

OVERHAUL

**NOTE:** Service Bulletins affecting the assembly are S.B. 74-1 which introduced a retaining clip and S.B.72-58 Part 2 which introduced gaskets and Part 1 a substitute clip for S.B.74-1.

- (1) Measure the distance from the pilot nozzle mounting flange abutment face to the top of the nozzle and note as dimension A.

**NOTE:** The centre of the fuel outlet orifice is the effective nozzle penetration but measurement of length to the tip of the nozzle permits direct calculation in determining adjusting washer thickness.

- (2) Measure the distance between the mounting boss abutment face on the CCOC and the inner edge of the combustion chamber outer flame tube and note as dimension B.

**NOTE:** On engines with CCOC incorporating bolted on igniter and pilot nozzle mountings, dimension B is measured from the pilot nozzle adjusting washer abutment surface on the saddle plate outer.

- (3) On engines to SB.74-1 standard, measure the thickness of the retaining clip (73-12-07/1-40), and record as dimension T.
- (4) On engines to SB.72-58 standard, measure the thickness of each new gasket (73-12-07/1-25) separately on the undeformed area, add the measurements together and record as dimension K.

SUB-ASSEMBLY

**72-00-51**

Page 598.16

Feb 1/83

OLYMPUS 593

MK.610-14-28

OVERHAUL

(5) Pilot nozzle penetration (dimension C) is as follows:

(a) On engines pre SB.73-12 standard,

$C = 0.216/0.140$  in. (5,49/3,56 mm)

(b) On engines to SB.73-12 standard,

$C = 0.250/0.140$  in. (6,35/3,56 mm)

Refer to Fits and Clearances 72-40-00/177.

(6) Calculate adjusting washer thickness W as follows:

$$W = A - B - T - K - C$$

Ignore dimensions T and K if not applicable.

NOTE: It is recommended that the maximum value of dimension C should be aimed for (Ref. para.(5)) by varying W to suit.

(7) If dimension W is a very small or negative value, carry out one of the following alternatives:

(a) Incorporate SB.73-8527-68, deleting the clip and its associated gasket. Re-calculate dimension K (Ref. para.(4)) and delete dimension T in the formula in para.(6). Ensure that the necessary documentation is completed.

(b) Delete the adjusting washer and its gasket. This is acceptable provided that nozzle penetration is within the limits stated in paragraph (5).

NOTE: Do not use more than one gasket between any two mating faces.

- (6) Machine the adjusting washer (73-12-07/1-30) (if required), to the calculated thickness (plus 0.000, minus 0.002 in. (plus 0,00, minus 0,05 mm)). Refer to 72-09-21 Repair, Fig.450 for the procedure.

**CAUTION:** ADJUSTING WASHERS, RETAINING CLIPS AND GASKETS MUST NOT BE INTERCHANGED UNLESS RE-MATCHED BY DIMENSIONAL CALCULATION. ENSURE THAT COMPONENTS ARE ASSEMBLED TO MATCHING PILOT NOZZLE LOCATIONS.

C. Assemble Fuel Pressure Atomizing (Pilot) Nozzle Assembly to CC0C (Ref.Fig.537).

- (1) Refer to the Illustrated Parts Catalogue for the pilot nozzle securing bolts (73-12-07/1-20 or 1-21) relative to the CC0C standard, then apply lubricant 'C' to the bolts.
- (2) On engines to Pre S.B.72-58 and S.B.74-1 or to S.B. 73-8527-68 standard (no gaskets or retaining clip).
- (a) Apply jointing compound 'A' to abutment surface of the pilot nozzle, adjusting washer (73-12-07/1-130) and CC0C. Assemble the washer to the nozzle, then insert the nozzle into the same CC0C location that was used to calculate its penetration.
- (b) Align the attachment holes and secure the nozzle with the bolts (73-12-07/1-20 or 1-21) torque-tightened to 100 lbf in. (11,5 N.m) using the procedure specified for jointing compound application (Ref.72-09-00 Assembly).

SUB-ASSEMBLY

## 72-00-51

Page 598.20

OVERHAUL

- (3) On engines to Pre S.B.72-58 and S.B.74-1 or to S.B. 73-8527-68 standard (no gaskets but retaining clip interposed).

NOTE: As the pilot nozzle attachment bolts secure the retaining clip, which also locates around the igniter plug, the bolts cannot be tightened until the igniter plug is assembled. As the bolts must be tightened using the procedure specified for jointing compound application (Ref.72-09-00 Assembly), carry out the igniter plug measuring procedure before assembling the pilot nozzle, so that the plug can be assembled with the pilot nozzle to enable the torque-tightening of the bolts to be carried out correctly.

- (a) Apply jointing compound 'A' to abutment surface of the pilot nozzle, adjusting washer (73-12-07/1-30), retaining clip (73-12-07/1-40A) and CCOC.

NOTE: Do not apply jointing compound to the igniter spacer washer location on the retaining clip.

- (b) Assemble the washer and clip to the nozzle, then insert the nozzle into the same CCOC location that was used to calculate its penetration.
- (c) Align the attachment holes and secure the nozzle with bolts (73-12-07/20A or 21A). Do not tighten the bolts at this stage (Ref.para.E.(2)).
- (4) On engines to S.B.72-58 and Pre S.B.74-1 or to S.B. 73-8527-68 standard (gaskets interposed but no retaining clip).
- (a) Assemble the specified adjusting washer (73-12-07/1-30) with a gasket (73-12-07/1-25) on each side, to the nozzle, then insert the nozzle into the same CCOC location that was used to calculate its penetration.

- (b) Align the attachment holes and secure the nozzle with bolts (73-12-07/20A or 21A) torque-tightened to 100 lbf in. (11,5 N.m). Wire-lock the bolts together.
- (5) On engines to S.B.72-58 and S.B.74-1 and to pre S.B. 73-8527-68 standard (with gaskets and retaining clip interposed).
- (a) Assemble the specified adjusting washer (73-12-07/1-30) with a gasket (73-12-07/1-25) on each side, to the nozzle, followed by the retaining clip (73-12-07/1-40B) and third gasket. Insert the nozzle into the same CCOC location that was used to calculate its penetration.
  - (b) Align the attachment holes and secure the nozzle with bolts (73-12-07/20A or 21A). Do not tighten the bolts at this stage (Ref.para.E.(2)).
- (6) On engines to S.B.73-8527-68 standard (with or without adjusting washer and/or retaining clip).
- (a) With the retaining clip removed, proceed as detailed in para.(4).
  - (b) With the adjusting washer removed, proceed as follows:
    - (i) Assemble the retaining clip (73-12-07/1-40B) with a gasket (73-12-07/1-25) on each side, to the nozzle, then insert the nozzle into the same CCOC location that was used to calculate its penetration.
    - (ii) Align the attachment holes and secure the nozzle with bolts (73-12-07/20A or 21A). Do not tighten the bolts at this stage (Ref.para.E.(2)).

D. Igniter Plugs Spacer Washers Thickness Measuring Procedure.

(1) With reference to Fig.537, obtain the following dimensions required for setting the igniter penetration in the combustion chamber.

- (a) Igniter plug tip to spacer washer abutment face on igniter plug (Dimension D).
- (b) Igniter plug spacer washer locating face on CCOC to inner surface of combustion chamber (Dimension E).

NOTE: On engines with CCOC incorporating bolted on igniter and pilot fuel sprayer mountings, dimension E is measured from the bottom of the spacer washer location in the igniter adapter to the inner surface of the CCOC.

(c) The required igniter plug penetration in the combustion chamber Dimension F is detailed in Fits and Clearances Schedule (72-40-00 F.C.S.176).

(d) Required spacer washer thickness (Dimension G).

(2) Determine the spacer washer thickness using the formula  $G = D - (E + F)$ .

(a) Select a spacer washer from the range (74-21-02/1-20A to 45A) (72-09-21 Repair, Fig.451 Sheet 1) Pre-SB.74-1 or (74-21-02/1-20B to 45B-50A-55A) (72-09-21 Repair, Fig.451 Sheet 2) S.B.74-1.

CAUTION: ENGINE IGNITER PLUGS AND SPACER WASHERS MUST NOT BE INTERCHANGED UNLESS RE-MATCHED BY DIMENSIONAL CALCULATION. ENSURE THAT COMPONENTS ARE ASSEMBLED TO MATCHING IGNITER LOCATIONS.

**E. Assemble Engine Igniter Plugs to CC0C (Ref.Fig.537).**

- (1) Ensure cleanliness of all components. The igniter plug is installed without lubricant.
  - (a) On engines to pre S.B.74-1 place the spacer selected from the range (74-21-02/1-20A to 45A) (72-09-21 Repair, Fig.451 Sheet 1) on the igniter plug. Screw the plug into the CC0C and torque-tighten to 42 lbf ft (57,0 N.m). Check that the igniter is screwed fully into position.
  - (b) On engines embodying S.B.74-1 place the spacer selected from the range (74-21-02/1-20B to 45B-50A-55A) (72-09-21 Repair, Fig.451 Sheet 2) over the igniter hole in the CC0C. Ensure that the retaining clip (73-12-07/1-40) previously assembled to the pilot nozzle location holds the spacer in position. Screw the igniter plug into the CC0C and ensure that the retaining clip and spacer are correctly positioned. Torque-tighten the igniter plug to 42 lbf ft (57,0 N.m). Check that the igniter is screwed fully into position.
- (2) On engines embodying S.B.74-1 ensure that the retaining clip is correctly positioned on the igniter spacer washer. Torque-tighten the pilot nozzle retaining bolts to 100 lbf in. (11,5 N.m), then wire-lock the bolts together.

**NOTE:** On engines to pre S.B.72-58 (no gaskets assembled to pilot nozzle), torque-tighten the bolts using the procedure specified for jointing compound application (Ref.72-09-00 Assembly).

- (3) Assemble protectors to the ends of the igniters.

41. Assemble Heat Insulation Shields to CCOC (Ref.Fig.539)

A. Prepare Heat Shields.

- (1) Apply lubricant 'G' to the heat shield panel joints and knitmesh cushion damper abutment surfaces. Apply lubricant 'B' to securing bolts.

B. Assemble Heat Shields.

- (1) Position the heat shield panel (71-32-01/1-40) on the left-hand side of the CCOC and panel (71-32-01/1-240) on the right-hand side. Ensure that the panel joints overlap correctly on the captive bolts. Temporarily secure the panels together at the following positions.
  - (a) Assemble bolts and flat washers (71-32-01/1-30-20) at positions A.
  - (b) Assemble locknuts and flat washers (71-32-01/1-10-20) at positions B.
- (2) Secure each panel to the brackets on the CCOC flange as follows (Ref.Fig.539).
  - (a) Secure the knitmesh damper assembly with bolt (71-32-01/1-70) to position C near the upper side of the left-hand trunnion.
  - (b) Secure the knitmesh damper assembly with bolt (71-32-01/1-50) to position D near the lower side of the left-hand trunnion.
  - (c) Secure the remaining knitmesh damper assemblies with bolts (71-32-01/1-60-250).
- (3) Ensure that the nuts and bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Use the torque wrench (Tool 1664) and torque-tighten all the nuts and bolts between 67 and 73 lbf in. (7,5 and 8,2 N.m).

NOTE: The heat insulation shield assembly is not secured to the rear of the CCOC at this stage.

42. Assemble Inspection Port Blanking Covers to CC0C (Ref.Fig.540)

A. Assemble Covers at Bottom, Left and Right-Hand Positions.

(1) Install the cover at bottom position.

(a) Assemble the bracket to CC0C.

(i) Insert a gasket (72-42-01/2-195) between the bracket 972-42-01/2-190B).

(ii) Secure the bracket to the CC0C with screws (72-42-01/2-180). Tighten the screws and ensure that the screw heads do not protrude above the surface of the bracket.

(b) Assemble the blanking cover to CC0C.

(i) Insert a gasket (72-42-01/2-175) between the blanking cover (72-42-01/2-170B) and bracket.

(ii) Secure the blanking cover with bolts (72-42-01/2-160) with lubricant 'C' applied, then torque-tighten to 100 lbf in. (11,5 N.m). Wire-lock the bolts together with single strand wire. Do not twist the wire.

(2) Install the cover at the left-hand position.

(a) Place the bracket (76-21-01/2-110) in position on the inspection port flange. Retain the bracket in position with two screws (76-21-01/2-100). Tighten the screws and ensure that the screw heads do not protrude above the surface of the bracket.

- (b) Place the blanking cover (76-21-01/2-80) in position and retain with bolts (76-21-01/2-70) with lubricant 'C' applied. Ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) then torque-tighten the bolts to 100 lbf in. (11,5 N.m). Wire-lock the bolts together. Do not twist the wire, lock the bolts with single strand only.

- (3) Install the cover at the right-hand position.

- (a) Locate the blanking cover (72-42-01/2-50) on the port together with the spacer plate (72-42-01/2-45) on engines to SB.72-8629-256 standard. Retain in position with bolts (72-42-01/2-40) with lubricant 'C' applied, then torque-tighten to 100 lbf in. (11,5 N.m). Wire-lock the bolts together with single strand only.

#### 43. Assemble Anti-icing Port Cover/Fuel Heater Bracket/Optical Pyrometer Ports Blanking Plates to CCOC (Ref.Fig.540)

##### A. Assemble Anti-icing Port Cover.

- (1) Place the blanking cover (72-42-01/2-70) in position and secure it to the CCOC with bolts (72-42-01/2-60), torque-tightened to 100 lbf in. (11,5 N.m) with lubricant 'C' applied.

NOTE: The anti-icing valve is installed during the main engine assembly procedure.

##### B. Assemble Fuel Heater Bracket.

- (1) Apply lubricant 'B' to the securing bolts (75-03-01/3-160).
- (2) Place the bracket (75-03-01/3-180) in position on the CCOC and secure it with three bolts. Assemble a bolt and flat washer (75-03-01/3-170) to the location near the bracket.
- (3) Torque-tighten the bracket securing bolts between 67 and 73 lbf in. (7,6 and 8,3 N.m). Wire-lock the bolts together.

NOTE: When the bracket is not assembled to the engine assemble three bolts (72-42-01/2-350) with lubricant 'C' applied to the bracket location. Torque-tighten the bolts to 100 lbf in. (11,5 N.m) and wire-lock.

C. Assemble Optical Pyrometer Ports Blanking Plates and Brackets (Pre SB.72-7856-179 Standard).

- (1) Apply jointing compound 'A' to the abutment surfaces of blanking plates (72-42-01/2-340). Apply lubricant 'B' to the bolt threads (72-42-01/2-270). Apply lubricant 'C' to the bolt threads (72-42-01/2-260). Ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).
- (2) Assemble blanking plates to CC0C.
  - (a) Place the blanking plates in position on the optical pyrometer ports. Some blanking plates have an additional unwanted hole. Plates of this type must be installed with the unwanted hole at the rear (Ref. SB.72-88).
  - (b) Temporarily retain the blanking plates with bolts (72-42-01/2-260) but do not assemble bolts to bracket locations at this stage.
- (3) Assemble brackets to blanking plates.
  - (a) Position a bracket (72-42-01/2-300A) on the blanking plate which is in line with the left hand inspection port. Secure the bracket with two bolts (72-42-01/2-260).
  - (b) Position a bracket (72-42-01/2-280A) on the remaining blanking plate. Secure the bracket with two bolts (72-42-01/2-270).
  - (c) Torque-tighten bolts (72-42-01/2-270) to between 60 and 75 lbf in. (6,8 and 8,5 N.m). Torque-tighten bolts (72-42-01/2-260) to 100 lbf in. (11,5 N.m). Wire-lock the bolts together at each blank position.

D. Assemble Brackets to CCOC (SB.72-7856-179 Standard).

(1) Assemble the bracket (72-42-01/2-300B) and tray (71-51-01/7-290).

- (a) Place the bracket on the location in line with the left-hand inspection port cover. Secure the bracket with two bolts (72-42-01/2-290), torque-tightened to 100 lbf in. (11,5 N.m) with lubricant 'C' applied. Wire-lock the bolts together.
- (b) Assemble the tray (71-51-01/7-290) to the previously installed bracket. Secure the tray with pillar bolt (71-51-01/7-280) and bolt (71-51-01/7-250) with lubricant 'B' applied. Do not fully tighten the bolt but torque-tighten the pillar bolt between 67 and 73 lbf in. (7,6 and 8,2 N.m). Loosely assemble the locknut (71-51-01/7-270) to the pillar bolt.

(2) Assemble the bracket (72-42-01/2-280B).

- (a) Place the bracket on the location near the previously assembled tray. Secure the bracket with two bolts (72-42-01/2-270B) torque-tightened to 100 lbf in. (11,5 N.m) with lubricant 'C' applied. Wire-lock the bolts together.

44. Temporarily Assemble LP Turbine Nozzle Vane Assembly to CCOC (Ref.Fig.541)

A. Assemble LP Turbine Nozzle Vane Assembly.

- (1) Ensure that the lifting equipment is correctly assembled to the nozzle vane assembly.

NOTE: The LP turbine nozzle vane assembly is a separate sub-assembly (Ref.72-52-01) complete with lifting equipment.

- (2) Assemble the multiple leg sling (Tool 1645) to the nozzle vanes lifting equipment and attach a crane hoist to the sling.

- (3) Ensure the cleanliness of the CCOC rear flange and LP turbine nozzle vanes. Carefully lower the assembly into position on the CCOC flange. Ensure that the inspection port in the CCOC aligns with the hole in No.13 nozzle vane and that No.11 and 14 vanes align with the thermocouple locations in the CCOC.
- (4) When the nozzle vane assembly is fully in position, carefully slacken the knurled nuts securing the retaining hooks to the nozzle vanes.

NOTE: Slacken the hooks sufficiently to allow the nozzle vanes to assume unrestrained positions. Do not disengage the retaining hooks from the nozzle vanes.

- (5) Align the clearance bolt-holes in the nozzle vanes with the bolt-holes in the CCOC flange.
- (6) Attach the multiple leg sling (Tool 1645) to the clamping ring (Tool 1262). Carefully lower the clamping ring into position on the CCOC flange and nozzle vane assembly.
- (7) Secure the clamping ring to the CCOC with nuts evenly tightened.
- (8) Ensure that the thermocouple probes will penetrate fully and freely.

B. Turbine Nozzle Dimensional Check.

- (1) Carefully remove the clamping ring from the CCOC flange. Ensure that the nozzle vane assembly is not disturbed.
- (2) At four equally spaced positions measure the step A from the nozzle vane to the rear flange surface of the CCOC (Ref.Fig.541). The dimension must be within the limits of 0.025 in. and 0.035 in. (0,635 and 0,889 mm). Record the actual dimension for engine assembly reference.

OVERHAUL

C. Remove LP Turbine Nozzle Vane Assembly.

- (1) Ensure that the nozzle vanes retaining hooks are correctly in position and that the knurled nuts are fully tightened.
- (2) Carefully remove the LP turbine nozzle vane assembly from the CCOC and return it to the appropriate area.

45. Completion of Assembly

A. Final Examination.

- (1) Ensure that all operations have been completed satisfactorily and inspected where necessary.
- (2) Ensure that all locking arrangements are correctly secured and open ports correctly blanked.
- (3) Remove the protector from the HP turbine nozzle vane assembly. Examine the sub-assembly internally for cleanliness.

B. Transport Sub-assembly to Main Engine Assembly Area.

CAUTION: EXERCISE CARE TO PREVENT DAMAGE TO FUEL SPRAYERS DURING TRANSPORTATION.

- (1) Assemble the lifting fixture (Tool 1310) to the rear flange of the CCOC.
- (2) Prepare a pallet (Tool 1014) to accept the sub-assembly. Remove the bolts securing the sub-assembly to the assembly stand.
- (3) Release the sub-assembly, then carefully raise the assembly from the stand and transfer it to the prepared pallet in preparation for transportation to the main engine assembly area (72-00-00 Assembly).

NOTE: If SB.72-64 or 72-86 are incorporated, module interchangeability will be affected. Check to ensure that the module identification plate is in accordance with the interchangeability chart.

STANDARD PRACTICES - ASSEMBLY

1. General

- A. Before commencing assembly, check the inspection records/ reports to ensure that all components are cleared for assembly, having had any repairs or modifications called for embodied.
- B. Prior to assembly, examine all components to ensure that they have not been damaged during storage or transit, and that they are clean.
- C. When installing or connecting items or units during the assembly sequence, ensure that joint faces and sealing ring grooves are clean and free from damage.
- D. During assembly, all blanks and covers shall be left in position until the assembly sequence necessitates their removal, in order to protect protruding items and joint faces and to prevent the ingress of foreign matter. The appropriate engine blanks and covers shall be installed at the completion of each stage during engine final assembly.
- E. Throughout the assembly, reference is made to the Modification (Mod) No. or Service Bulletin (S.B.) No. to accommodate engines of varying standards brought about by the introduction of modifications. Where direct replacement occurs unaffected the assembly sequence, the S.B. or Mod. will not be quoted, but the Illustrated Parts Catalogue (I.P.C.) reference will denote the S.B. or Mod., enabling the engine to be built to the standard required. For information on the relationship of Mod. and S.B., refer to the Service Bulletin Index, and for embodiment information (if applicable), refer to the Service Bulletin folder.
- F. During assembly, all vital dimensions that must be obtained are referenced in the text to the appropriate section and Ref.No. of the Fits and Clearances Schedule (F.C.S.).
- G. All self-locking nuts, captive nuts and inserts that have passed the Inspection/Check examination are reusable providing that they satisfy the locking (run-down) torque specified in para.3.

## 2. Application of Lubricants and Compounds

### A. General.

**CAUTION:** EXTREME CARE MUST BE TAKEN TO ENSURE THAT MOLYBDENUM DISULPHIDE LUBRICANT IS NOT USED IN AREAS WHERE IT IS NOT SPECIFIED. MOLYBDENUM DISULPHIDE LUBRICANTS BREAK DOWN ABOVE 300 DEG C. RELEASING SULPHUR WHICH CAN INDUCE STRESS CORROSION AND PREMATURE FAILURE OF ENGINE PARTS SO LUBRICATED.

- (1) Where the application of a lubricant, jointing compound or locking compound is necessary during assembly, it is specified by means of a letter, e.g. apply lubricant 'B'. Refer to Table 501 for specifications and approved brands for these materials.

### B. Thread Lubricants.

- (1) Apply the recommended lubricant (Ref. appropriate Sub-assembly Chapter) immediately prior to assembly.

- (a) Ensure that all traces of preservatives are removed and that the surfaces to be lubricated are clean and dry.
- (b) Using a suitable small brush (if the viscosity of the lubricant permits), apply just sufficient lubricant to cover the following surfaces:

Nut to bolt or stud	...	Abutment face of nut and threads of bolt or stud
Setbolt	... ..	Abutment face of bolthead and threads of bolt
Retaining nut to shaft	...	Abutment face of nut and threads of shaft
Tube end fittings	...	Union body threads and ferrule groove or abutment face mating with thrust wire or nut respectively

- (2) Ensure that lubricant contamination on any other surface is removed immediately.

### C. Jointing Compounds.

- (1) Ensure that the joint faces are smooth and free from burrs.

ASSEMBLY

72-09-00

Page 503

Jun 30/97

OLYMPUS 593

MK.610-14-28

OVERHAUL

sneema

- (2) Clean the joint faces using a clean, lint free cloth moistened with a group 2 or 4 solvent (Refer to Table 501).
- (3) Apply a thin even coating of jointing compound to both faces using a clean stiff bristle brush or a small flexible knife; leave a clear border (0.050 in. (1,27 mm) maximum width) around the inner edges of the joint thus preventing internal exuding.  
  
NOTE: Sufficient compound should be applied to allow a slight exuding from the outer edges of the joint when it has been made.
- (4) A minimum of 10 minutes air drying time must be allowed before the joint is assembled.
- (5) Check the torque loading of joint securing nuts or bolts after a wait of at least 10 minutes after torque-tightening and, if necessary, restore to required value. Compound can slowly exude under pressure resulting in a considerable reduction of nut or bolt torque loading.
- (6) Remove surplus compound using a clean, lint free cloth moistened with a group 2 or 5 solvent (Refer to Table 501) before complete hardening occurs.

D. Application of Locking Compound.

- (1) Clean surfaces to receive the compound using a clean, lint free cloth moistened with a group 2, 3 or 4 solvent (Refer to Table 501).

WARNING: USE PRIMERS ONLY IN WELL VENTILATED AREAS. PRIMERS CONTAIN CHLORINATED SOLVENTS AND ARE HIGHLY VOLATILE.

WARNING: DO NOT ALLOW PRIMERS OR COMPOUND TO CONTAMINATE THE SKIN. IF ACCIDENTAL CONTAMINATION OCCURS, WASH OFF WITH SOAP AND WATER.

CAUTION: DO NOT PRIME TITANIUM ALLOYS.

- (2) If required, apply primer in accordance with the recommendation of the manufacturer.

ASSEMBLY

72-09-00

Page 504

Jun 1/96

OLYMPUS 593

MK.610-14-28  
OVERHAUL

sneema

- (3) Apply a thin coat of compound to one of the mating surfaces, either directly from the bottle through the dispenser nozzle, or by dipping in the compound contained in a shallow polythene dish.

NOTE: The compound used for dipping shall be discarded after use, not returned to the bottle.

- (4) In blind hole applications, apply the compound to the hole and assemble the components with a twisting motion to ensure joint coverage (indicated by a small fillet of compound around the joint line).

- (5) Assemble the components and allow to cure at room temperature.

NOTE: Bonded parts may be handled after 15 minutes. The adhesive attains full strength in 5 hours.

### 3. Torque-tightening

#### A. General.

- CAUTIONS:
1. EXTREME CARE MUST BE TAKEN TO ENSURE THAT MOLYBDENUM DISULPHIDE LUBRICANT IS NOT USED IN AREAS WHERE IT IS NOT SPECIFIED. MOLYBDENUM DISULPHIDE LUBRICANTS BREAK DOWN ABOVE 300 DEG C. RELEASING SULPHUR WHICH CAN INDUCE STRESS CORROSION AND PREMATURE FAILURE OF ENGINE PARTS SO LUBRICATED.
  2. IT IS OF THE UTMOST IMPORTANCE TO ENSURE THAT ALL FEED/SCAVENGE FILTERS AND MAGNETIC PLUG ASSEMBLIES ARE FULLY TORQUE-TIGHTENED ON ASSEMBLY. FAILURE TO DO THIS CAN RESULT IN OIL LEAKAGE IN FLIGHT WHICH MAY NOT BE APPARENT DURING GROUND CHECKS/ /RUNNING.
  3. WRENCHES USED FOR TORQUE-TIGHTENING MUST BE CALIBRATED AT REGULAR INTERVALS AGAINST A CERTIFIED CHECKING RIG. TORQUE WRENCH ACCURACY SHALL BE WITHIN  $\pm 5$  PER CENT.

- (1) A specific torque loading is applied when tightening threaded components to ensure optimum security and to prevent overstressing which could result in subsequent failure.

ASSEMBLY

72-09-00

Page 505

Jun 1/99

OLYMPUS 593

MK.610-14-28

OVERHAUL

SNECMA

- (2) The torque loadings are specified in the relevant Sub-assembly Chapters, together with the applicable locking (run-down) torques where the component concerned has a friction type locking device.
- (3) Never exceed the stated maximum torque loading, nor loosen an item when torque-tightened to obtain alignment of a locking device.
- (4) To ensure that the specified torque loading is achieved, the components must be lubricated as specified in para.2.A. and B.

#### B. Using Adapters with Torque Wrenches.

NOTE: In certain instances a special adapter is specified to enable a torque wrench/adapter assembly to be calibrated on the checking rig, rendering the following calculations unnecessary.

- (1) When an adapter which alters the leverage is used with a torque wrench it is necessary to compensate the indicated torque reading accordingly.
- (2) If the adapter increases the effective leverage (Ref.Fig.501, detail A), the following formula must be used to determine the compensated wrench setting:

$$S = \frac{L \times T}{L + E}$$

where S = compensated wrench setting  
 L = effective length of wrench  
 E = effective length of adapter  
 and T = required torque loading

NOTE: When using this and similar formulae, all quantities must be expressed in similar units, i.e. wrench length in feet if required, torque is in lbf ft.

ASSEMBLY

72-09-00

Page 506

Jun 1/99

OLYMPUS 593

MK.610-14-28  
OVERHAUL

sneema

- (3) For example, to find the compensated wrench settings -- when using a 10 in. wrench and 5 in. adapter to torque-tighten a nut to between 67 and 73 lbf in.:

$$S = \frac{10 \times 67}{10 + 5} = 44.7 \text{ lbf in. (lower limit)}$$

and

$$S = \frac{10 \times 73}{10 + 5} = 48.7 \text{ lbf in. (upper limit)}$$

therefore the wrench settings are 45 and 49 lbf in. (corrected to the nearest lbf in.).

- (4) If the adapter decreases the effective leverage of the wrench (Ref. detail B) the formula must be altered to subtract the adapter length from the wrench length:

$$S = \frac{L \times T}{L - E}$$

- (5) No compensation of the wrench setting is required if the adapter does not alter the effective leverage of the wrench (Ref. detail C).
- (6) When the adapter axis is not parallel to the wrench axis, the effective length of the adapter must be measured in a plane parallel to the wrench axis (Ref. detail D).

C. Locking (Run-down) Torque Check of Components with Friction Type Locking Features.

- (1) Lubricate the item as specified in para.2.B.

- (2) Run down the nut or bolt until the locking element is fully engaged, with the load faces out of contact.

NOTE: A self-locking nut is fully engaged when the end of the bolt is flush with, or slightly protruding from the end of the nut.

- (3) Using a direct reading torque wrench, measure the torque required to turn the nut or bolt. This locking (run-down) torque must be within the limits specified in the relevant Sub-assembly Chapter, or if not quoted, as specified in 72-09-00 Inspection/Check, Table 318.
- (4) If the nut or bolt fails to meet the locking torque requirements, use selective assembly or, if this fails, renew the nut or bolt and recheck the locking torque until satisfactory.
- (5) Torque-tighten the nut or bolt to the figure specified in the relevant Sub-assembly Chapter.

NOTE: Unless otherwise stated, the torque-tightening figure is inclusive of the locking torque, i.e. the locking torque shall not be added to the torque-tightening figure.

- (6) After torque-tightening the nut ensure that a minimum of one and a half threads is protruding beyond the outer face of the nut.
- (7) Reject and destroy any nut where it is obvious that it will not give a satisfactory locking torque on any bolt. Do not attempt to restore locking properties.

D. Components with Locking Features Requiring Alignment.

- (1) Lubricate the assembly as specified in the relevant Chapter.
- (2) Run down the nut or bolt by hand.
- (3) Torque-tighten the nut or bolt to the lower figure specified.

CAUTION: NEVER SLACKEN OFF TORQUE-TIGHTENED NUT OR BOLT TO ACHIEVE ALIGNMENT OF LOCKING FEATURE.

- (4) Continue tightening slowly within the upper torque limit until alignment of the locking feature is achieved.

- (5) If alignment cannot be achieved within the torque-tightening limits, slacken the nut or bolt right off, then repeat the torque-tightening procedure. If alignment still cannot be achieved, renew the nut or bolt.

#### 4. Locking

##### A. Cupwashers (Ref.Fig.502).

- (1) Before locking a reconditioned cupwasher, check that the new locking positions are not less than twice the width of one nut slot away from any previous locking positions. If this condition cannot be satisfied, install a new cupwasher.
- (2) Using the special punch (if specified), lock the cupwasher.
  - (a) In one location on double-hexagon bolts.
  - (b) In two locations on nuts with four slots.
  - (c) In three locations on nuts with six or more slots.

NOTE: Locking locations shall be as near equispaced as possible.

##### B. Peening (Ref.Fig.503).

- (1) When locking of threaded components or pins by means of peening is specified, use the appropriate method shown in the illustration.

##### C. Keywashers.

CAUTION: DO NOT PRE-SET TABS OF KEYWASHERS BEFORE INSTALLATION. FAILURE MAY RESULT.

- (1) Place the keywasher in position, ensuring that the "snugged" limb is correctly located.
- (2) Lubricate, install and torque-tighten the nut or bolt.
- (3) Check that the "snugged" limb has not sheared due to turning with the nut or bolt.

- (4) Turn up the tabs of the keywasher against the flat(s) of the nut or bolt. Refer to para.3.D. if alignment of the tabs with the flat(s) cannot be achieved.
- (5) Check that the tabs have not cracked at the base where they are turned up.
- (6) Inspect to ensure that the nut or bolt is effectively prevented from turning by the tabs.

D. Split Cotter Pins.

- (1) Ensure that the slots of the nut are correctly aligned with the hole in the bolt (if applicable). Refer to para.3.D. if out of alignment.

CAUTION: DO NOT REDUCE SPLIT END OF PIN IN SIZE TO FACILITATE INSERTION.

- (2) Insert the split pin fully and part the legs.
- (3) On nuts, position one leg to closely abut the face of the nut, and the other leg to closely abut the free end of the bolt and not extending further than the centre of the bolt.
- (4) On shouldered pins, position the legs around and closely abutting the pin.

E. Wire-locking (Ref.Fig.504).

- (1) Unless otherwise stated, use the approved locking wire given in Table 501, for all wire-locking applications.
- (2) Ensure that the locking wire is adequately tensioned to resist rotation of the locked component. Also ensure that there are no untwisted lengths of wire in excess of  $\frac{1}{4}$  in. (10 mm) and no unsupported lengths in excess of 3 in. (76 mm).
- (3) Refer to the illustration for typical acceptable locking configurations.
- (4) Ensure that cut off pieces of wire are retrieved and are not allowed to become lost in or around the engine.
- (5) Tuck the free end of the locking wire away so that it cannot catch either skin or clothing.

## 5. Rim Clenching Clamp Assemblies

### A. Assemble the Clamp (Ref.Fig.505).

- (1) Examine the clamp segments to ensure that they are all marked with the same identification symbol.

NOTE: Together with the identification symbol, each segment is marked with the number 1, 2, 3 or 4 to ensure that they are reassembled in the correct order.

- (2) Arrange the segments in numerical order with the ends aligned blade to fork and with the grooves facing the same way.
- (3) Install the pins, washers and split cotter pins to secure the segments together.
- (4) Install the eye-bolts and secure with the pins, washers and split cotter pins.
- (5) Submit the assembled clamp for a bedding check (Ref.72-09-00 Inspection/Check).

### B. Install the Clamp.

- (1) Check the surfaces of the joint flanges to ensure freedom from defects, e.g. burrs, on the abutment faces, sealing surfaces, taper surfaces and outside diameter. If necessary, clean these surfaces using a clean, lint free cloth moistened with a group 1 or 3 solvent (Refer to Table 501).
- (2) Apply a thin coating of lubricant 'A' to the taper surfaces.
- (3) Check the surfaces of the clamp assembly to ensure freedom from defects, e.g. burrs, on the taper surfaces, threads, abutment faces of nuts and washers and spherical seatings of the trunnions. If necessary, clean these surfaces using a clean, lint free cloth moistened with a group 1 or 3 solvent (Refer to Table 501).
- (4) Apply a thin coating of lubricant 'A' to the taper surfaces, threads, abutment faces of nuts and washers and spherical seatings of the trunnions.
- (5) Assemble the components, ensuring that the joint flanges are concentric, parallel and with no appreciable gap between them.

ASSEMBLY

72-09-00

Page 517

Jun 1/96

OLYMPUS 593

MK.610-14-28

OVERHAUL

sneema

- (6) Install the clamp and install the spherical washer, lockwasher and self-locking nut on the inner eye-bolt only.
- (7) Check the locking (run-down) torque of the nut is within the limit specified for the component.
- (8) Torque-tighten the nut to the limit specified for the component.
- (9) Tap each clamp segment in turn using a soft-faced mallet or fibre drift.
- (10) Again torque-tighten the nut.
- (11) Repeat tapping of each clamp segment in turn.
- (12) Finally torque-tighten the nut.
- (13) Install the spherical washer, lockwasher and self-locking nut on the outer eye-bolt.
- (14) Check the locking (run-down) torque of the nut.

NOTE: The torque-tightening of the outer eye-bolt nut will reduce the torque loading on the inner eye-bolt nut.

CAUTION: DO NOT ATTEMPT TO CHECK TORQUE LOADING OR RE-TIGHTEN INNER EYE-BOLT NUT AFTER TORQUE-TIGHTENING OUTER EYE-BOLT NUT.

- (15) Torque-tighten the nut.

#### 6. Quick Attach/Detach (QAD) Couplings (Ref.Fig.506)

##### A. Engage, Tighten and Lock QAD Couplings.

- (1) Prepare coupling for tightening before unit installation.

CAUTION: EXAMINE THE THREAD SURFACES AND ABUTMENT FACES OF THE RING AND FLANGE FACES TO ENSURE ALL SURFACES ARE FREE OF ANY DEFECTS OR DAMAGE MARKS.

- (a) Clean the surfaces of the coupling ring and flange thread segments, and the abutment faces of the spherical washer and bolt, using a clean, lint free cloth moistened with a group 1 or 3 solvent (Refer to Table 501).

(b) Apply a thin coating of lubricant 'A' to the thread surfaces, bolt threads and abutment face, and the spherical washer abutment faces.

(c) Apply lubricant (70-00-03, Sealing Devices) to the toroidal sealing ring before installation.

**B. Engage Coupling Ring.**

- (1) Align the unit to the mounting face and turn the coupling ring so that its thread segments align with the threaded flange slots and the spherical nut trunnion is positioned so that it can be tightened to the clamping bolt trunnion when the segmented threads are engaged.
- (2) Locate the unit on the mounting face as detailed in the relevant chapter. Ensure that the sealing ring is in position, assembly pins and drive shaft splines are engaged and that the mating faces are squarely in abutment.
- (3) Turn the coupling ring in the direction to bring the trunnions together by hand and engage the segmented threads as far as possible.

**C. Tighten the Coupling Ring.**

**CAUTION:** ENSURE THAT THREADS HAVE CORRECTLY ENGAGED BEFORE ATTEMPTING TO TIGHTEN COUPLING RING.

DO NOT USE THIS PROCEDURE TO TIGHTEN RIGHT-HAND GEARBOX TO INTERMEDIATE CASE COUPLING RING. REFER TO 72-00-00, ASSEMBLY.

- (1) Insert clamping bolt, together with spherical washer through fixed locking trunnion and screw into spherical nut of coupling ring trunnion by hand.
- (2) Measure the locking (run-down) torque of the bolt.
  - (a) Screw bolt in until load faces are just out of contact.
  - (b) Measure torque necessary to turn bolt and ensure that it is within the specified limits given in the relevant component chapter.

ASSEMBLY

**72-09-00**

Page 520

Dec 1/97

MK.610-14-28  
OVERHAUL

- (3) Tighten the locking bolt with wrench (Ref.72-00-00, Special Tools, Tool 419) using one hand only.

NOTE: The amount of turn given to the bolt by use of this wrench gives an action that results in a positive full run-down to near the final tightening position without exceeding the torque-loading limit.

- (4) Torque-tighten the locking bolt to the value specified for the unit.
- (5) Tap radially around the periphery of a coupling ring, where accessible, using a hide faced hammer or an 8 ounce hammer and aluminium drift and ensure equal disposition of the ring.
- (6) Measure the torque-loading remaining on the locking bolt.
- (7) Repeat operations (4), (5) and (6) until the following conditions are met.
  - (a) There is less than 18 lbf in. (2 N.m) difference between the specified torque-loading (4) and the torque-loading remaining (6).
  - (b) The bolt is tightened to within the specified torque-loading limits.

## 7. Ball and Roller Bearings

### A. Prepare the Bearing.

NOTE: Preparation is not required if the bearing has been temporarily protected as detailed in 72-09-00 Inspection/Check.

CAUTION: DO NOT REMOVE PROTECTIVE COATINGS FROM BEARINGS UNTIL IMMEDIATELY PRIOR TO INSTALLATION.

- (1) If the bearing has been temporarily protected with petroleum jelly, remove the bearing from its bag and wipe off the surplus jelly using a clean, lint free cloth.
- (2) If the bearing is a new one which has been protected using Protective PX11, clean the bearing.
  - (a) Remove the bearing from its protective wrapping.

ASSEMBLY

72-09-00

Page 521

Sep 1/80

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (b) Immerse the bearing in a bath comprising 70 per cent (by volume) aviation kerosine and 30 per cent oil to D.Eng.R.D.2490 or the recommended engine oil, maintained at a temperature of between 75 and 85 deg C. Keep the bearing in the bath until it attains the bath temperature and all the protective has melted off.
- (c) Remove the bearing from the bath and allow to drain.
- (d) Rewash the bearing in a fresh bath prepared and operated as detailed previously.
- (e) Remove the bearing from the bath and allow to drain.

**B. Install the Bearing.**

- (1) Immediately prior to installation, lubricate the bearing with the recommended engine oil.
- (2) Unless otherwise stated, install the bearing so that the Part No., Serial No. and/or other identification symbols remain visible.
- (3) Use only the recommended tools and equipment to install the bearing.

**8. Tubes**

**CAUTION:** DO NOT ATTEMPT TO RECTIFY LEAKAGE FROM TUBE END FITTINGS BY FURTHER TIGHTENING. REMOVE TUBE, INSTALL NEW SEALING DEVICES AND/OR RECTIFY DEFECT, THEN REINSTALL TUBE AND RECHECK FOR LEAKAGE.

**A. Rigid Tubes.**

**CAUTION:** DO NOT STRAIN RIGID TUBE TO ALIGN END FITTINGS AND/OR SUPPORT CLIPS. IF TUBE WILL NOT ALIGN WITHOUT STRAIN, REMOVE IT AND INVESTIGATE CAUSE.

- (1) Lubricate and install new sealing rings (if applicable).
- (2) Lubricate the tube end fittings as specified in the relevant Chapter (if applicable).
- (3) Position the tube and ensure that the end fittings align with their locations.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

SNECMA

- (4) Connect the end fittings and tighten as far as possible by hand.
- (5) Ensure that the tube support clips will align without straining the tube.
- (6) Using a suitable spanner to prevent turning of the tube and/or union adapter (if applicable), torque-tighten each union nut in turn to the figure specified in the relevant Chapter. Wire-lock the nuts.
- (7) Install the tube support clips.

#### B. Flexible Tubes.

- (1) Lubricate the tube end fittings as specified in the relevant Chapter.
- (2) Position the tube, connect the end fittings and tighten as far as possible by hand.
- (3) Ensure that the tube is not twisted, distorted or kinked.
- (4) Using a suitable spanner to prevent turning of the tube and union adapter, torque-tighten each union nut in turn to the figure specified in the relevant Chapter. Wire-lock the nuts.
- (5) Install the tube support clips.

### 9. Sealing Rings

#### A. Toroidal Sealing Rings.

- (1) Lubricate the sealing ring before installation.
  - (a) In the fuel system, apply lubricant 'F'.
  - (b) In other locations, apply lubricant 'A'.
- (2) Install the sealing ring in its groove, ensuring that it is not twisted or kinked.
- (3) Assemble the components carefully and ensure that sealing rings are not displaced or damaged.

ASSEMBLY

72-09-00

Page 523

B. Metallic Sealing Rings.

- (1) Leave metallic sealing rings in their protective packages until immediately prior to use.
- (2) Retain Corruplus sealing rings in their grooves with lubricant 'E' used sparingly, and ensure seals are not displaced or damaged during assembly of component.

10. Tri-wing Fasteners (Ref.Fig.507)

- A. The size of the recess in the head of a tri-wing fastener is indicated by means of a number in a circle.
- B. It is essential when installing a tri-wing fastener that a driver bit carrying the same number as the fastener is used. The size number of the driver bit is marked on the shank, either contained within a circle or as a suffix to the part number.

11. Temporary Markings

- A. During the assembly of the sub-assemblies and the engine, it is necessary to apply temporary markings to assist in the balancing, aligning and positioning of items. The type of temporary marking and their particular application are recommended as follows.
  - (1) Small adhesive labels. Used during the mass moment weighing of compressor and turbine blades, and the subsequent balancing of the bladed disks.
  - (2) Tailors chalk or rapid drying ink applied by felt point pen. Used to indicate datum holes or positions of compressor disks and spacers during assembly, when the permanent markings are obscured during the assembly.

ASSEMBLY

72-09-00

Page 524  
Dec 31/99

OLYMPUS 593

MK.610-14-28

- (3) Adhesive tape. Used to indicate bracket or bolt positions on abutment flanges of sub-assemblies during the assembly.

CAUTION: DO NOT USE LEAD PENCIL OR METALLIC PENCIL OR ANY MARKING MEDIUM THAT LEAVES A DEPOSIT OF CARBON, ZINC, COPPER OR LEAD. THESE DEPOSITS MAY CAUSE CEMENTATION OR INTERGRANULAR ATTACK AT HIGH TEMPERATURE AND RESULT IN STRENGTH LOSS AND SUBSEQUENT FAILURE. IF SURFACES ARE ACCIDENTALLY CONTAMINATED WITH THESE DEPOSITS, CAREFULLY REMOVE THE DEPOSIT USING A METHOD APPROPRIATE TO THE TYPE OF DEPOSIT AND THE COMPONENT MATERIAL.

- B. When the temporary marking is no longer required, ensure that the ink or chalk mark is removed with a suitable solvent, or the adhesive tape or label is removed and the residue adhesive removed from the engine item with a suitable solvent.

## 12. Identification of Components

### A. General.

- (1) With the exception of small items, each component will be identified by series of alpha- numerics, the numbers off, position and form of markings will vary, depending on the components size, shape and material. The various alpha- numerics that may be found and what they represent are detailed as follows.

### B. Material Batch/Code Number.

- (1) The batch/code number is the manufacturers identification of where and when the component was produced and is recorded on the data recording/retrieval inspection records. It is identified by a , followed by letters denoting the contractor, and numbers denoting when the batch was produced. The symbol may point towards, or be above the batch/code numbers as space dictates. A letter C preceding the symbol denotes the component is subject to Customs and Excise control.

Examples

BAA99

RAZ80

C AZA66

- (2) The batch/code number will not exceed five digits, but an oblique stroke followed by additional code letters and/or numbers will refer to a heat treatment that has been carried out on the item. The heat treatment identification will not be recorded on the data recording/retrieval inspection records.

### C. Locational Code/Serial Number.

- (1) The code/serial number is the manufacturers identification of where the component is produced and is recorded on the data recording/retrieval inspection records. Each single piece component or a fabricated component with two or more pieces of material that are permanently joined will be identified by a , while an assembly will be identified by an O. In each instance the symbol will be followed by a location serial number.

Examples

RBC23

BAB60

CE567

WB432

TN7604

OLYMPUS 593

MK.610-14-28

OVERHAUL

D. Part Number.

- (1) The part number is the manufacturers identification of a component. Each component or a fabricated component that is permanently joined will be identified by a letter B followed by six numbers. The part number is the reference used in the Illustrated Parts Catalogue for ordering spares or replacing components.
- (2) If the component is without a B identification, it will be a National Standards Part component and may be identified by A, SP, AGS, AS, AN, MS, NAS, FBS, FB, UBS or U.

E. Salvage Number.

- (1) The salvage number (e.g. SAL. B.478086) or alternatively an abbreviated Repair No. (e.g. R.1), will only be found on components that have had a repair carried out. A letter following the repair number (e.g. R.1A, R.1B etc.) identifies the number of a composite numbered repair, while a letter 'X' after the number or letter, denotes each additional application of the repair following the first application.
- (2) During manufacture minor defects, corrections, faults etc. may have been accepted by minor concessions, with possible minor salvage which will be identified by an MC or CON.

F. Miscellaneous Numbers.

- (1) Bevel gears will have a mounting distance MD number which is a dimension used in the manufacture of the gears and will be required during the setting up of the gears to their correct position during assembly. Other markings found on gears may be SET and TV.
- (2) Components may have a laboratory identification L followed by numbers, which will refer to a manufacture heat treatment, or some other process.
- (3) Depending on the component and whether it has had numerous forms of machining, or is fabricated, inspection checks denoted by a BA may have been applied. The BA and a number may be contained in a circle.

### 13. LP and HP Compressor Rotor Blade Identification

#### A. General.

- (1) To achieve rapid identification of the rotor disk datum blades in both the LP and HP compressors when carrying out intrascope inspection, a Potassium Silicate high temperature paint may be applied to the tip of the datum blades. The recommended paint is MSRR.9041 and is available from:

Rolls-Royce Limited,  
Aero Division,  
P.O. Box 31,  
Moor Lane,  
DERBY.

- (2) Although available in a variety of colours, it is recommended in order to achieve contrast between blade material and paint, and to obviate the need for stoving, that the following colour is used:

Yellow - Code PL 168A ... Used in conjunction with  
Potassium Silicate  
Solution No.66 grade and  
Thinners SV16/R1.

NOTE: Other colours in the range require stoving.

- (3) The shelf life of paints to MSRR.9041 is six months in temperate climates and three months in tropical climates. Paints exceeding the recommended shelf life should be laboratory tested before use.

#### B. Application of Paint.

- (1) Observe the safety precautions instructed by the paint manufacturer.
- (2) Degrease the area to be painted using a clean lint-free cloth moistened with white spirit.
- (3) Apply one coat of Potassium Silicate solution No.66 grade by brushing and allow to air dry for ten minutes.
- (4) Apply one coat of paint (PL 168A) by brushing and allow to air dry for at least one hour. The minimum temperature for applying the paint is 16 deg C.

#### 14. Bolt and Nut Tightening Sequences

##### A. General.

- (1) In areas where high density bolting occurs, tightening is carried out in a symmetrical pattern to ensure that strain is not induced in the structure.

##### B. Circular Flanges.

- (1) Tighten nuts/bolts at circular flanges in a sequence similar to that shown in Fig.508, detail A.
  - (a) Lightly tighten two nuts/bolts approximately opposite to each other and then lightly tighten another pair approximately at 90 degrees to the first pair. Bisect the resulting angles and proceed as before.
  - (b) With the joint flanges in contact torque-tighten the nuts/bolts in sequence, as detailed in (a), to the specified torque value.
  - (c) As a precaution, check each nut/bolt sequentially in a clockwise direction for tightness to ensure that no nut/bolt has been omitted in the torque-tightening sequence.

##### C. Half Casing Flanges.

- (1) Tighten nuts/bolts at half casing flanges in a sequence similar to that shown in Fig.508, detail B.
  - (a) Lightly tighten the two mid-section positioned nuts/bolts first and then lightly tighten the remaining nuts/bolts working outwards from the centre.
  - (b) With the joint flanges in contact torque-tighten the nuts/bolts in sequence, as detailed in (a), to the specified torque value.
  - (c) As a precaution, check each nut/bolt progressively from one end to the other for tightness to ensure that no nut/bolt has been omitted in the torque-tightening sequence.

## 15. Component Life Marking

### A. General.

There are two separate systems of coding used to represent the number of running hours on engine components. One system is used by the Iberia overhaul facility and is described in paragraph B. The other system, described in paragraph C, is used by the BEOL overhaul facility.

### B. System of Coding Used by Iberia Overhaul Facility.

#### (1) Identification of running hours.

- (a) Components with zero running hours are marked with the letter 'N'.
- (b) Components with accrued running hours are marked with the letter 'U', followed by the code number/letter which is established in accordance with the following:
  - (i) Running hours are rounded to the nearest 50, e.g. 1217 becomes 1200 and 1232 becomes 1250.
  - (ii) After rounding, the number is allocated a code as detailed in Table 502.

Code	Running Hours (Rounded)
A	50
1	100
1A	150
2	200
2A	250
etc. to	
10	1000
10A	1050
11	1100
11A	1150
etc. to	
99	9900
99A	9950

Iberia Overhaul Facility Coding System  
Table 502

ASSEMBLY

72-09-00

Page 531  
Mar 1/80

OLYMPUS 593

MK.610-14-28  
OVERHAUL

(iii) The code number is obtained by disregarding the last two digits of the number of running hours (rounded). When the last two digits are 50, the letter 'A' is added to the code number.

(b) Successive code markings on a component are separated by an oblique stroke / and each code mark represents the running time since the previous mark. Total running time is obtained by adding all code markings together.

#### C. System of Coding Used by BEOL Overhaul Facility.

##### (1) Identification of running hours.

(a) This system of coding relates running hours to an identification letter as shown in Table 503.

NOTE: The letter I is not used.

---

Code	Running Hours
A	1 to 100
B	101 to 200
C	201 to 300
D	301 to 400
E	401 to 500
F	501 to 600
G	601 to 700
H	701 to 800
J	801 to 900
	etc. to
Z	2401 to 2500

---

Refer to para.(b) for symbols to denote multiples of 2500

## ENGINE TURNING

### 1. General

Provision is made for turning the HP and LP rotating assemblies using hand turning equipment. The HP assembly is turned through a drive in the right-hand gearbox, while the LP assembly is turned through a drive in the pulse probe drive and housing.

CAUTION: THESE PROCEDURES APPLY TO ENGINES THAT ARE STANDING IN THE VERTICAL POSITION FOLLOWING ENGINE BUILD OR ENGINES IN THE HORIZONTAL POSITION WHERE LUBRICATION HAS BEEN MADE EFFECTIVE BY AN ENGINE RUN. LABYRINTH RUB AND EXCESSIVE RESISTANCE TO ROTATION OCCURS WHEN BEARINGS HAVE NO OIL SQUEEZE FILM.

The lubricant quoted in these procedures is stated in 72-09-00 Standard Practices.

### 2. Hand Turning Equipment

NOTE: Select the appropriate procedures dependent on which rotating assembly requires turning.

#### A. Install the LP Turning Equipment (Ref.Fig.501, Detail A).

- (1) Remove the bolts securing the cover to the pulse probe drive and housing flange then withdraw the cover.
- (2) Assemble the universal joint (Tool 1872) and adapter (Tool 1876) to the flange ensuring that the assembly pin on the adapter flange locates in the housing flange. Secure the assembly with three equally spaced bolts lubricated with lubricant 'A' and torque-tightened between 85 and 95 lbf in. (9,6 and 10,8 N.m).
- (3) Engage the extension bar (Tool 1873) square drive in the universal joint and assemble the torque adapter (Tool 1875) to the extension bar.
- (4) Pre-set a torque wrench (Tool 1877) between 150 and 180 lbf in. (16,9 and 20,3 N.m) and assemble to the torque adapter.

NOTE: The torque wrench is pre-set to prevent excessive loading should a sudden force be applied to the torque wrench.

OVERHAUL

- (5) Apply a gradual force at the torque wrench to turn the LP rotating assembly.

B. Install the HP Turning Equipment (Ref.Fig.501, Detail B).

- (1) Remove the bolts and washers securing the cover blank to the engine right-hand gearbox cover flange, then withdraw the cover.
- (2) Locate the universal joint (Tool 1872) and adapter (Tool 1876) in position on the cover flange ensuring that the assembly pin on the adapter flange locates in the gearbox cover flange. Secure the assembly with three equally spaced bolts lubricated with lubricant 'A' and torque-tighten between 90 and 100 lbf in. (10,2 and 11,3 N.m).
- (3) Engage the extension bar (Tool 1873) square drive in the universal joint and assemble the torque adapter (Tool 1875) to the extension bar.
- (4) Pre-set a torque wrench (Tool 1874) between 360 and 400 lbf in. (40 and 45 N.m) and assemble to the torque adapter.

NOTE: The torque wrench is pre-set to prevent excessive loading should a sudden force be applied to the torque wrench.

- (5) Apply a gradual force at the torque wrench to turn the HP rotating assembly.

C. Remove the LP Turning Equipment.

- (1) Remove the torque wrench (Tool 1877), then withdraw the torque adapter (Tool 1875) and extension bar (Tool 1873).
- (2) Remove the bolts securing the adapter (Tool 1876) and universal joint (Tool 1872) to the flange and withdraw the adapter and universal joint.

SUB-ASSEMBLY

- (3) Assemble the cover (72-64-00/1-20) and a new gasket (72-64-00/1-25) to the flange and secure with seven bolts (72-64-00/1-10) lubricated with lubricant 'A' and torque-tightened between 85 and 95 lbf in. (9,6 and 10,8 N.m)

D. Remove the HP Turning Equipment.

- (1) Remove the torque wrench (Tool 1874), then withdraw the torque adapter (Tool 1875) and extension bar (Tool 1873).
- (2) Remove the bolts securing the adapter (Tool 1876) and universal joint (Tool 1872) to the gearbox cover flange, then withdraw the adapter and universal joint.
- (3) Assemble the cover blank (72-63-01/4-70) and a new gasket (72-63-01/4-80) to gearbox cover flange and secure with seven bolts (72-63-01/4-50) and washers (72-63-01/4-60) ensuring that the bolts are lubricated with lubricant 'A'. Torque-tighten the bolts between 90 and 100 lbf in. (10,2 and 11,3 N.m).

OLYMPUS 593

MK.610-14-28  
OVERHAUL

AIR INLET SECTION - SUB-ASSEMBLY

1. General

- A. Before commencing this assembly refer to 72-09-00 Assembly, for general information.
- B. Throughout the text, special tools are quoted by their reference number; e.g. Tool 1324. For a complete list of the tooling required for assembly and for the Manufacturer's Part Number, refer to Special Tools, Fixtures and Equipment, Table 1002.
- C. During the sub-assembly procedure, reference will be made to the Illustrated Parts Catalogue (I.P.C.) to identify those items where the nomenclature does not positively identify them, due to the duplication of the title e.g. nuts, bolts, washers, bearings, gears, housings, tubes etc. When the item is a part of the breakdown of the text concerned, the item will be identified as bolt (1-10), the 1 referring to the I.P.C. Fig.No., and the 10 referring to the Item No. Where items from a different breakdown are introduced, then the breakdown number will be quoted in addition e.g. bolt (72-32-01/1-10).
- D. The five vanes between inner and outer casing are identified by numbering them counter-clockwise when viewed from the front, starting with No.1 vane at the top.

2. Assemble the LP Compressor Front Bearing Support

- A. Assemble the Pins to the Bearing Housing (Ref. SB.72-46 and SB.72-76).

NOTE: Para.2.A. is only applicable if new items are being assembled.

NOTE: The following Fig. and Item numbers after the names of the parts in para.2 refer to Section 72-23-01 in the I.P.C.

- (1) Place the four shouldered pins (1-70) into a freezing agent Cardice for (approx) 20 minutes or liquid nitrogen for (approx) 2 to 3 minutes.

OVERHAUL

- (2) Place the bearing housing on the bench, then remove the pins from the freezing agent and tap one pin into the location in the front flange face, and three pins into the locations in the front inner face (Ref.Fig.501).

B. Assemble the Bearing to the Bearing Housing (Ref.Fig.501).

- (1) If the roller bearing (1-80) is a new item, remove the protective wrapping and grease (Ref.72-09-00 Assembly). If the roller bearing is the original item, assemble the cage and rollers to the outer track.

NOTE: The procedure should be carried out in an approved 'clean' room.

- (a) Position the cage inside the outer track, then press the rollers by hand into the cage.
  - (b) Ensure that the cage and rollers rotate freely. Apply temporary protection if required (Ref. 72-09-00 Inspection/Check para.4).
- (2) On pre-SB.72-17 engines, determine the thickness of retaining plate required to give the correct end-float between the bearing outer track and the shroud on the retaining plate.

NOTE: SB.72-17 Part 1 introduced bearing housings and retaining plates as matched sets, obviating the need for machining the retaining plate to size.

- (a) Insert the bearing outer track and rollers into the bearing housing, then assemble the retaining plate (1-100) with the raised shoulder towards the bearing, and engage the slots of the plate with the dogs of the bearing outer track. Lubricate the seven bolts (1-60) with lubricant 'A', then torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m).

PRINTED IN ENGLAND

TN9313

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (b) Measure the end-float between the bearing outer track and the shoulder on the retaining plate using feeler gauges.
- (c) If the end-float is less than 0.003 in. (0,076 mm), the retaining plate and bearing must be released and removed, and the shoulder of the retaining plate ground sufficiently to give the required clearance (Ref.para.7). If, however, the end-float is more than 0.004 in. (0,102 mm), a new retaining plate must be assembled and the amount to be machined calculated as follows.
- (i) Remove the bearing and measure the width of the outer track 'B' (Ref.Fig.501).
- (ii) Assemble and secure the retaining plate to the bearing housing, without the bearing, and measure the gap 'A' between the shoulder of the retaining plate and the shoulder of the bearing housing, using slip gauges.
- (iii) Calculate the amount to be removed from the retaining plate shoulder to produce the correct end-float by first adding 0.0035 in. (0,089 mm) to dimension 'B' and then subtracting dimension 'A' from the total i.e.  $B + 0.0035 - A$ .
- (iv) Release and remove the retaining plate and despatch it to the machining area for the shoulder to be ground to reduce the plate thickness by the calculated amount (Ref. para.7).
- (3) On engines to SB.72-17 standard or engines to Pre. SB.72-17 when the end-float has been checked and found to be within limits (Ref.para.(2)), assemble the bearing and retaining plate to the bearing housing, then apply lubricant 'A' to the seven retaining bolts and assemble the bolts to secure the retaining plate. Check that the run-down torque is not less than 3.5 lbf in. (0,4 N.m), then torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m).

OVERHAUL

- (4) Place the assembled bearing housing in a clean polythene or P.V.C. bag until required for assembly to the air intake case.

3. Assemble the Air Intake Case to the Build Stand (Ref.Fig.502)

A. Assemble the Holding Fixture (Tool 1254) to the Build Stand (Tool 1320).

- (1) Assemble the three shackles of the sling (Tool 1255) to the three eye-bolts of the holding fixture and raise the fixture on a hoist.
- (2) Turn the brackets on the stand so that they point upwards, then traverse the holding fixture beneath the brackets. Raise the fixture to locate it to the bottom surface of the brackets, then secure it with eight slave bolts and nuts.
- (3) Release the shackles from the eye-bolts, then remove the sling from the hoist and invert the fixture so that the eye-bolts are on the bottom.

B. Assemble the Air Intake Case to the Holding Fixture.

- (1) Position the air intake case front (smaller inner diameter) uppermost. Attach a hoist to the lifting ring of the lifting fixture (Tool 894), then raise the lifting fixture and position it over the centre of the case.
- (2) Position the three hooks of the lifting fixture under three of the five vanes then lift and position the case over the stand.

NOTE: A location hole which identifies the vane nearest to it as vane No.1 is to be found between two of the bolt holes in the case rear flange.

- (3) Bring the location hole into alignment with the locating pin next to the word TOP on the holding fixture. Turn the clamps of the holding fixture so that they do not obstruct the rear flange of the case and slowly lower the case onto the fixture. Screw the captive bolts fully into the tapped holes in the rear flange and then swing the clamps onto the flange and tighten the clamp nuts. Remove the lifting fixture from the case and the hoist.

#### 4. Assemble the Air Intake Case

- A. Assemble the Anti-icing Manifold to the Case (Ref.Fig.503).

NOTE: The Figure and Item numbers following the names of parts of the anti-icing manifold relate to Section 75-11-01 of the I.P.C.

- (1) Assemble the duct (2-70) to the case at vane No.3 position.
- (a) Assemble the seal ring (2-140) to the duct, in readiness for assembly to the duct at vane No.2.
- (b) Apply lubricant 'B' to the six bolts (2-80, -90). Assemble the four longer bolts through the external holes of the duct and the two shorter bolts through the holes inside the duct and assemble the six bolts and duct to the case, at vane No.3, with the longer portion of the duct towards vane No.2. Check that the run-down torque is not less than 3.5 lbf in. (0,4 N.m), then torque-tighten the bolts between 80 and 90 lbf in. (9,0 and 10,2 N.m).
- (c) Assemble a protector (Tool 879) to the outer joint face of the duct (oil feed flange location) and secure the protector using the two captive bolts.
- (2) To the shorter portion of the duct at vane No.3 assemble the duct (2-150) leading to the connector at vane No.4.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (a) Install the seal ring (2-190) on the duct (2-150).
- (b) Insert duct and seal into the duct at vane No.3 and assemble the retainer (2-120), apply lubricant 'B' to the securing bolt (2-110) and install the bolt with the self-locking nut (2-100), check that the run-down torque is not less than 3.5 lbf in. (0,4 N.m) then temporarily tighten.
- (3) Assemble the connector (2-200) to the case at vane No.4 position.
  - (a) Apply lubricant 'B' to the bolts (2-210, -220), then install the four longer bolts to the outer holes and the two shorter bolts to the inner holes of the connector and assemble with the flange towards vane No.3. Check that the run-down torque is not less than 3.5 lbf in. (0,4 N.m), then torque-tighten the bolts between 80 and 90 lbf in. (9,0 and 10,2 N.m).
  - (b) Assemble a protector (Tool 879) to the outer joint face of the connector using the two captive bolts.
- (4) Assemble the duct (2-150) and bracket to the connector at vane No.4 and complete the security of the seal retainer assembled to the duct at vane No.3.
  - (a) Align the holes in the flange of the duct (2-150) to the holes (thread inserts) in the flange of the connector. Apply lubricant 'B' to the three bolts (2-170). Align the bracket (2-180) with the flange (Ref.Fig.503) and assemble the bolts, bracket and duct to the connector. Check that the run-down torque is not less than 3.5 lbf in. (0,4 N.m), then torque-tighten the bolts between 80 and 90 lbf in. (9,0 and 10,2 N.m).

SUB-ASSEMBLY

72-20-00

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (b) Check that the run-down torque is not less than 3.5 lbf in. (0,4 N.m), then torque-tighten the nut and bolt securing the retainer to the duct at vane No.3 between 85 and 95 lbf in. (9,5 and 10,7 N.m).
- (5) In the rear outer flange of the case install a bolt (72-22-01/1-30), position No.22 (unable to be done after completed assembly).
- NOTE: The bolts are installed from the front and then as viewed from the rear are identified by numbering them in a clockwise direction starting with No.1 bolt at the top.
- (6) Assemble the duct (2-10) to the duct at vane No.3 and to the case at vane No.2 position.
- (a) Check that the seal ring is fitted to the free end of the duct at vane No.3, then assemble the duct (2-10) over the seal ring and position the duct to align with the tapped holes in the case at vane No.2. Apply lubricant 'B' to the six bolts (2-20) and assemble the bolts to secure the duct. Check that the run-down torque is not less than 3.5 lbf in. (0,4 N.m), then torque-tighten the bolts between 80 and 90 lbf in. (9,0 and 10,2 N.m).
- (b) Apply lubricant 'B' to the bolt (2-40), then assemble the retainer (2-50), bolt and self-locking nut (2-30) to the duct (2-10) retaining the seal between the ducts. Check that the run-down torque is not less than 3.5 lbf in. (0,4 N.m), then torque-tighten the nut between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (c) Assemble and temporarily secure the flanged sleeve (2-60) and the protector (Tool 885) to the air inlet, using the retainer, bolt and self-locking nut (75-11-02/2-140, 2-130 and 2-120).

OVERHAUL

- (7) Assemble the duct (1-80) to the duct at vane No.2 and to the case at vane No.1 position.
- (a) Assemble the seal ring (1-160) to the duct (1-80), then insert the duct and seal into the free end of the duct at vane No.2. Position the duct so that the bolt-holes line up with the tapped holes at vane No.1.
- (b) Apply lubricant 'B' to the six bolts (1-90, 100 and 110), then assemble the bolts to secure the duct to the case at vane No.1. Check that the run-down torque is not less than 3.5 lbf in. (0,4 N.m), then torque-tighten the bolts between 80 and 90 lbf in. (9,0 and 10,2 N.m).
- (c) Apply lubricant 'B' to the bolt (1-130), then assemble the retainer (1-140), bolt and self-locking nut (1-120) to the duct (2-10) retaining the seal between the ducts. Check that the run-down torque is not less than 3.5 lbf in. (0,4 N.m), then torque-tighten the nut between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (8) Assemble the duct (1-10) to the case at vane No.5 position.
- (a) Assemble the seal ring (1-150) to the free end of the duct at vane No.1 then assemble the duct (1-10) over the seal ring and position the duct so that the bolt holes line up with the tapped holes in the case at vane No.5.
- (b) Apply lubricant 'B' to the six bolts (1-20, 30, and 40) then install the bolts to secure the duct. Check that the run-down torque is not less than 3.5 lbf in. (0,4 N.m), then torque-tighten the bolts to between 80 and 90 lbf in. (9,0 and 10,2 N.m).

NOTE: Bolt (1-40) to Mod.8095 has a hexagon head.

SUB-ASSEMBLY

PRINTED IN ENGLAND

- (c) Apply lubricant 'B' to the bolt (1-60), then assemble the retainer (1-70), bolt, and nut (1-50) to duct (1-10) retaining the seal between the ducts. Check that the run-down torque is not less than 3.5 lbf in. (0,4 N.m) then torque-tighten the nut between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (9) Ensure sufficient clearance between casing and manifold.
- (a) Using feeler gauges, check the clearance between the casing and manifold, between the vane 2 and 3 positions (Ref.Fig.503). If insufficient clearance install packing plates to achieve desired clearance.
- CAUTION: ENSURE PACKING PLATES INSTALLED CORRECTLY. THE PACKING PLATE APERTURE IS DISPLACED AXIALLY WITH RESPECT TO THE SYMMETRICAL BOLT HOLES. INCORRECT FITTING IS OBVIOUS SINCE THE PLATE AND MANIFOLD END FITTINGS WILL NOT MATCH.
- (b) Remove manifold using procedure detailed in 72-20-00 Disassembly to a point where packing plate(s) (2-15A/2-75A) can be installed to obtain desired clearance.
- (c) Install packing plate(s).
- (d) Re-install manifold repeating procedure previously detailed.
- (e) Re-check clearance between casing and manifold.

B. Assemble the Electrical Tube to the Case.

NOTE: The following Fig. and Item numbers after the names of parts refer to Section 72-22-01 in the I.P.C. unless otherwise quoted.

- (1) To prevent possible damage to the insulation of the cable which will be fed through, ensure that the entry to the electrical tube and the flared exit from the tube are free internally from sharp edges, and that the weld is smooth on the inside of the tube. Ensure also that the rear edge of the forward internal web of No.3 vane has an adequate radius. See Fig.505 (Ref.SB.77-6).

SUB-ASSEMBLY

MK.610-14-28

OVERHAUL

- (2) Position the tube assembly (2-180), to abut inside the front flange of the case and enter the inner end of vane No.3 (Ref.Fig.506).
- (3) Apply lubricant 'B' to the two countersunk head bolts (2-170), then assemble the bolts through the flange of the case into the thread inserts in the tube body (2-180A). Check that the run-down torque is not less than 3.5 lbf in. (0,4 N.m) and torque-tighten between 45 and 50 lbf in. (5,1 and 5,6 N.m). Check that the boltheads are below the surface of the joint face.

C. Assemble the Flange to the Front of the Case (Ref.Fig.504).

- (1) Install the 20 bolts (1-30) from the rear through the holes in the front flange of the case, then turn the bolts so that their D-heads are trapped in the groove of the case.

MK.610-14-28

OVERHAUL

- (2) Assemble the flange (1-40) to the bolts and the case so that the outside diameter of the flange locates the D-headed bolts and prevents them from turning.
- (3) Secure the flange with 20 slave nuts and temporarily tighten.

NOTE: The installed bolts will be used to retain the air intake fairing at a later stage of the assembly.

D. Assemble the Bearing Housing and Baffle to the Flange (Ref.Fig.504).

- (1) Rotate the build stand to invert the case, then assemble the flange of the bearing housing (72-23-01/1-110) to the inside of the flange (1-40), so that the threaded orifice for the oil feed tube location is next to vane No.2, and the threaded orifice for the oil scavenge tube location is between vanes No.3 and 4.
- (2) Assemble the (inner) baffle (1-60) over the bearing housing so that the oil tube locations in the baffle are next to vanes No.3 and 4.
- (3) Apply lubricant '8' to the ten bolts (1-20). Install the bolts through the front of the flange, bearing housing and baffle and assemble the self-locking nuts (1-10). Check that the run-down torque is not less than 3.5 lbf in. (0,4 N.m), then screw down the nuts until they contact the baffle. Release the nuts not more than 1/4 turn and check that there is a slight radial movement of the baffle. The nuts are torque-tightened in sub-para.E.(3).

E. Assemble the Oil Tubes to the Case (Ref.Fig.505 and 506).

- (1) Assemble the seals to the baffles.
  - (a) Hand dress the two seals (2-80) around their inner surface, to suit the tube to be assembled at vane No.4. Dress the ends of the seals to obtain a gap between 0.002 and 0.010 in. (0,051 and 0,254 mm), at each end as assembled round the tube. Chamfer the seals to suit the radius in the baffle.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (b) Position the two seals into the baffle, at vane No.4, then place the seal clamp (2-70) over the seals. Apply lubricant 'A' to the two bolts (2-60), then insert and lightly tighten the bolts and clamp to centralise the seats, without engaging the bolt threads in the locking portion of the inserts. Slacken the bolts, then torque-tighten them to 10 lbf in. (1,1 N.m) maintaining an even gap between faces at both ends of the clamp.
- (c) Measure the nip between the clamp and baffle. If the gap (nipped) is more than 0.010 in. (0,254 mm), machine the sealing face of the clamp (Ref.Fig.505) to obtain a nip between 0.008 and 0.010 in. (0,203 and 0,254 mm). If the nip is less than 0.008 in. (0,203 mm), then a new seal clamp must be used and the procedure repeated.
- (d) Assemble the seals and seal clamp to the baffle at vane No.3, in the same manner as detailed in para.(a) to (c).
- (e) Check that the run-down torque after engaging the bolt threads in the locking portion of the inserts is a minimum of 3.5 lbf in. (0,4 N.m).
- (2) Assemble the oil scavenge and feed tubes (2-50) to vanes No.3 and 4 (Ref.Fig.506).
  - (a) Scavenge tube (No.4 vane position).
    - (i) Assemble the alignment tool (Tool 878) to the oil scavenge tube using the four captive bolts.
    - (ii) Remove the protector from the connector at the end of vane No.4. Insert the tube through vane No.4 with the electrical tube towards the front.

**NOTE:** The tube has a joggle for anti-rattle purposes and therefore may be a tight fit in the vane. If so, the tube may be lightly tapped through the vane, or if it is excessively tight, interchanged with the tube at vane No.3.

OLYMPUS 593

MK.610-14-28 SNECMA  
OVERHAUL

(iii) Secure the alignment tool to the connector with four captive bolts.

(iv) Using the adapter (Tool 1662), check the torque loading of the cranked ring wrench (Tool 1606), then using the wrench, torque tighten the two bolts retaining the seal clamp to 100 lbf in. (11,5 N.m).

NOTE: Ensure that the clamp pulls down onto the face of the baffle.

(b) Feed tube (No.3 vane position).

(i) Ensure that the tube on the front of the oil feed tube has adequate internal radii at both ends to prevent damage to the insulation of the cable to be fed through it. (Ref.SB.77-6) (Ref.Fig.505).

(ii) Assemble the alignment tool (Tool 878) to the outer end of the oil feed/cold vent tube (2-50) using the four captive bolts.

(iii) Remove the protector from the duct at vane No.3 and insert the tube through vane No.3 with the electrical tube towards the front.

(iv) Secure the alignment tool to the duct with four captive bolts.

(v) Using the adapter (Tool 1662), check the torque loading of the cranked ring wrench (Tool 1607), then using the wrench torque-tighten the two bolts retaining the seal clamp to 100 lbf in. (11,5 N.m).

NOTE: Ensure that the clamp pulls down onto the face of the baffle.

(3) Torque-tighten inner baffle nuts.

(a) Torque-tighten the inner baffle securing nuts (1-10) to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

SUB-ASSEMBLY

72-20-00

Page 518

Sep 30/94

(4) Assemble the oil scavenge tube (2-190).

- (a) Apply lubricant 'A' to the loading face and threads of the union of the tube assembly (2-190), then assemble the tube assembly without the seal, between the tube at vane No.4 and the bearing housing.
- (b) Tighten the union nut sufficiently to bring the nipple of the tube into full contact with the bearing housing while maintaining freedom of movement of the tube within the union nut, then lightly press the mating faces of the flanges of the two tubes (2-50, 190) together checking with a 0.002 in. (0,05 mm) feeler gauge at the first point of contact for squareness. To be acceptable, the faces should be squarely aligned and parallel to within 0.005 in. (0,127 mm) and the securing bolts should enter their locations without obstruction. If the mating faces of the flanges do not meet these requirements, ascertain the degree of malalignment and carry out the correcting procedure detailed in paragraph (4).
- (c) Slacken the union, then assemble the Corruplus seal (2-120) between the mating faces of the tubes. Assemble the backing plate (2-130), then apply lubricant 'B' to the four bolts (2-90A) pre-SB.72-80, or to the upper inner bolt (2-90C) and three (longer) bolts (2-95A) (SB.72-80). Enter the two upper bolts from the right-hand side as viewed, and the two lower bolts from the left-hand side, and assemble the bolts with slave nuts to secure the two tubes. Tighten the four nuts using the wrenches (Tools 1604 and 1605), then, using the cranked wrench (Tool 880) torque-tighten the union nut between 280 and 310 lbf in. (31,6 and 35,0 N.m). Wire-lock the union nut.
- (d) Slacken the four bolts, then ensure that a gap of between 0.002 and 0.010 in. (0,051 and 0,254 mm) exists between the flanges of the tubes, and that the flanges are within 0.005 in. (0,127 mm) square. Assemble new nuts (2-110) to the flange securing bolts. On engines embodying SB.72-80, to assemble the nuts partly withdraw the upper inner bolt, then, holding the upper inner nut in

OLYMPUS 593

MK.610-14-28

OVERHAUL

the twelve point recess in the retainer (2-100) assemble the retainer to the upper outer bolt, with the held nut in position over the inner bolt and assemble the outer nut to secure the retainer. Torque- tighten the nuts using the ring wrenches (Tools 1604 and 1605) to between 85 and 95 lbf in. (9,6 and 10,7 N.m) ensuring for SB.72-80 that the nut securing the retainer is tightened first permitting the torque-tightening of the trapped nut.

- (e) Remove the alignment tool from the outer end of the tube and replace the protector (Tool 879).

(5) Assemble the oil feed tube (2-150).

- (a) Apply lubricant 'A' to the loading face and threads of the union of the tube (2-150), then assemble the tube, without the seal, between the tube at vane No.3 and the bearing housing.
- (b) Tighten the union nut sufficiently to bring the nipple of the tube into full contact with the bearing housing while maintaining freedom of movement of the tube within the union nut, then lightly press the mating faces of the two tubes together checking with a 0.002 in. (0,05 mm) feeler gauge at the first point of contact for squareness. To be acceptable, the faces should be squarely aligned and parallel to within 0.005 in. (0,127 mm) and the securing bolts should enter their locations without obstruction. If the mating faces of the flanges do not meet these requirements, ascertain the degree of malalignment and carry out the correcting procedure detailed in paragraph (4).
- (c) Slacken the union, then assemble the Corruplus seal (2-120) between the mating faces of the tubes. Assemble the backing plate (2-130), then apply lubricant 'B' to the four bolts (2-90A) (pre-SB.72-80), or to the inner upper bolt (2-90C) and three (longer) bolts (2-95A) (SB.72-80). Enter the two upper bolts from the right-hand side as viewed, and the two lower bolts from the left-hand side then assemble the bolts with slave nuts to secure the two tubes. Tighten the four nuts using the wrenches (Tools 1604 and 1605), then using the cranked wrench (Tool 881) torque-tighten the union nut between 220 and 240 lbf in. (24,8 and 27,1 N.m). Wire-lock the union nut.

SUB-ASSEMBLY

**72-20-00**

Page 520

Dec 1/81

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (d) Slacken the four flange bolts, then ensure that a gap of between 0.002 and 0.010 in. (0,051 and 0,254 mm) exists between the flanges of the tubes and that the flanges are within 0.005 in. (0,127 mm) square. Assemble new nuts (2-110) to the flange securing bolts. On engines embodying SB.72-80, to assemble the nuts partly withdraw the upper inner bolt, then, holding the upper inner nut in the twelve point recess in the retainer (2-100) assemble the retainer to the upper outer bolt with the held nut in position over the inner bolt and assemble the outer nut to secure the retainer to the backing plate. Torque-tighten the nuts using the ring wrenches (Tools 1604 and 1605) between 85 and 95 lbf in. (9,6 and 10,7 N.m) ensuring for SB.72-80 that the nut securing the retainer is tightened first permitting the torque-tightening of the trapped nut.
- (e) Remove the alignment tool from the outer end of the tube and replace the protector (Tool 879).
- (6) Procedure for correcting malalignment of oil feed and scavenge tubes (Ref Fig 507)
  - (a) Ascertain the degree of malalignment and if necessary draw sketches to indicate the directions in which correction is required.
  - (b) Clamp the setting block assembly of the tool kit (Tool 3131) firmly in a vice.
  - (c) Remove the oil feed and/or scavenge tube (2-190,2-150) to be corrected, from the air intake case.
  - (d) Secure the flange of the oil tube to the setting block with the clamp plates, bolts, washers and nuts from the tool kit, as shown.
  - (e) Insert the correct size setting pin in the setting block location that is aligned with the tube end. The pin can be used as a datum for establishing the amount of movement obtained on the tube when applying the correcting force.

SUB-ASSEMBLY

**72-20-00**

Page 521

Dec 1/81

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (f) Hold the appropriate setting tool on a straight section of the tube and carefully apply the correcting force in the required direction. Check the amount of movement obtained by using the setting pin as a datum point.

NOTE: It is recommended that alignment of bolt holes is achieved prior to correcting parallelism and that movement of the tube is obtained in several small increments. Constant trial checking of the tube in the air intake case is advised.

- (g) When malalignment has satisfactorily been corrected, subject the tube to the crack detection procedure recommended in 72-20-00, Inspection/Check.
- (h) Continue with the assembly procedure of paragraphs (2) or (3) as applicable.

F. Check for Leakage from the Oil Tube/Anti-icing Space Seals.

CAUTION: IT IS IMPORTANT TO LIMIT THE AMOUNT OF LEAKAGE ACROSS THESE SEALS. IDEALLY, NO LEAKAGE SHOULD OCCUR, BECAUSE ANY OIL WHICH REACHES THE ANTI-ICING AIR SPACE HAS DIRECT ACCESS THROUGH THE COMPRESSOR TO CABIN AIR.

- (1) Position the air intake case so that it is horizontal with the rear flange uppermost.
- (2) Place a suitable oil tray on the floor beneath the centre of the case, then ensure that protectors (Tool 889) are assembled to the connectors at the outer end of vanes No.3 and No.4.

MK.610-14-28  
OVERHAUL

- (3) Fill the space between the bearing housing and the baffle with engine oil within 1.25 in. (32 mm) of the top, then measure and record the amount of oil which leaks from the front inner flange. The leak must not be greater than 5 drops per minute.
- (4) Drain the oil from the air intake case by slowly tilting the case in the stand. Collect the oil in a suitable container.
- (5) In the event of leakage in excess of 5 drops/min carry out remedial action; remove the oil tubes and form and assemble new seal halves.
  - (a) Inspect the area surrounding the sealed joints, between the baffle and tubes in the anti-icing space external to the baffle to determine, if possible, which of the seals is leaking. Slacken the two bolts of the seal clamp, using the cranked ring wrench (Tool 1606 or 1607).
  - (b) Remove the protector from the manifold at the outer end of the vane and install the alignment tool (Tool 878) to the end of the oil tube and to the manifold, using the eight captive bolts.
  - (c) At the bearing housing and using wrench (Tool 880 or 881), release the union of the tube assembly and, using wrenches (Tool 1604 and 1605), unscrew the four bolts to disassemble the tube assembly, sealing ring and backing plate from the tube at the vane. For SB.72-80 the nut securing the retainer must be released last.
  - (d) Disassemble the alignment tool from the manifold by unscrewing the outer four captive bolts, then withdraw the oil tube from the clamp, seal and vane. If withdrawal is difficult, replace the alignment tool with adapter (Tool 519) and impact puller (Tool 1690).

SUB-ASSEMBLY

**72-20-00**

Page 524

Jul 1/81

OVERHAUL

- (e) Unscrew the two bolts using wrench (Tool 1606 for scavenge or 1607 for feed) and remove the clamp from the seal. Inspect, remove and reform the two halves of the seal, or form new seals to the tube and baffle, following the procedure detailed in para.E. Assemble the oil tubes as detailed in para.E., then recheck the leakage (Ref.para.F.) ensuring that the rate of leakage does not exceed 5 drops/min.

G. Assemble the Flange and Filter to the Feed Tube.

- (1) Remove the protector and assemble the flange (2-10) and gasket (2-140) if SB.72-35 is embodied, to the oil feed tube with the filter location towards the rear (Ref.Fig.506). Apply lubricant 'B' to the four bolts (2-30) and assemble the bolts to secure the flange to the tube. Torque-tighten the bolts between 67 and 73 lbf in. (7,5 and 8,2 N.m), then wire-lock them in two pairs.
- (2) Apply lubricant 'B' to the four bolts (2-20), then install the bolts to secure the flange to the anti-icing duct. Check that the run-down torque is a minimum of 3.5 lbf in. (0,4 N.m), then torque-tighten them between 67 and 73 lbf in. (7,5 and 8,2 N.m).
- (3) Check that the filter (72-01-01/1-10) is to Mod.8082, then insert the filter into its location in the flange and retain it by screwing the protector (Tool 886) onto the flange connection.
- (4) Assemble the protector (Tool 887) to the air vent location on the flange.

H. Assemble the Flange to the Scavenge Tube.

- (1) Remove the protector and assemble the flange (72-01-04/1-260) and gasket (2-140) if SB.72-35 is embodied, to the oil scavenge tube with the outlet elbow to the rear (Ref.Fig.506). Apply lubricant 'B' to the four bolts (72-01-04/1-290) and assemble the bolts to secure the flange to the tube. Torque-tighten the bolts between 67 and 73 lbf in. (7,5 and 8,2 N.m), then wire-lock them in two pairs.

SUB-ASSEMBLY

**72-20-00**

Page 525

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (2) Apply lubricant 'B' to the two bolts (72-01-04/1-280), then assemble with bracket (72-01-04/1-300) to the flange as shown in Fig.506. Apply lubricant 'B' to the two bolts (72-01-04/1-270) and assemble to the flange. Check that the run-down torque is a minimum of 3.5 lbf in. (0,4 N.m), then torque-tighten the four bolts between 67 and 73 lbf in. (7,5 and 8,2 N.m).
- (3) Assemble a suitable protector onto the flange connection, then assemble the blank (Tool 887) onto the air vent location.

## 5. Pressure Test the Bearing Housing and Oil Tubes

- A. Assemble the Pressure Test Equipment to the Case (Ref.Fig.508).

NOTE: An oil pressure test rig (Tool 583 or similar) is required. The rig must contain an oil heater, a temperature gauge and a pressure control valve. The rig must be capable of flowing 50 gal/h and of pressurizing the unit to 40 psig by use of a shut-off valve in the return system. The oil to be used in the rig is lubricant 'A'.

- (1) Remove the nut, fibre washer and end plate from the blank (Tool 884), then assemble the blank into the rear of the bearing housing. Assemble the end plate to the blank from the front of the housing in the case of early blanks (locating the offset hole over the pin in the bearing housing front face), then reassemble the fibre washer and the nut to retain the end plate.
- (2) Install the 12 slave bolts to secure the end plate (of early blanks only) to the front face of the bearing housing then tighten the centre nut.

CAUTION: TWO TOROIDAL SEALS (AS.12801-261 LARGE AND AS.12801-243 SMALLER) MUST BE USED WITH THE PRESSURE TEST BLANK AND MUST BE RENEWED IF DAMAGED.

MK.610-14-28  
OVERHAUL

- (3) At the outer end of vane No.4, remove the blank from the oil connector, screw on the oil outlet adapter (Tool 1871) and tighten.
- (4) At the outer end of vane No.3, remove the blank from the oil connector, screw on the oil inlet adapter (Tool 1001) and tighten.
- (5) Couple the feed pipe from the pressure test rig to the inlet adapter at vane No.3 and couple the return pipe to the outlet adapter at vane No.4.
- (6) Erect the screens (Tool 829) around the build stand.

B. Pressure Test and Flow Check.

WARNING: THE OIL IS USED FOR TESTING THE SYSTEM AT A TEMPERATURE OF 120 DEG C (AND AT 32 AND 40 PSIG). CARE MUST BE TAKEN IN ENSURING THAT SEALS ARE IN GOOD CONDITION, CONNECTIONS SECURELY MADE AND THE SCREENS PLACED IN POSITION. PROTECTIVE CLOTHING MUST BE WORN WHILE CARRYING OUT THE PRESSURE TEST AND FLOW CHECK PROCEDURE.

- (1) With the rig and equipment connected as detailed in para.A., flow oil at  $120 \pm 5$  deg C and 40 psig through the system for 10 minutes to allow component metal temperatures to stabilize.
- (2) Close the shut-off valve in the return feed line and maintain 40 psig for 30 minutes in the oil tubes and housing while observing for leaks.
- (3) Open the shut-off valve and flow test the tubes and housing at  $120 \pm 5$  deg C, with a pressure differential set between gauges on feed and scavenge pipes of 32 psig, and record the total oil flow through the system. The total oil flow must be between 20.5 and 25 litres per hour (4.5 and 5.5 gallons per hour).

IN39945

OLYMPUS 593

MK.610-14-28

OVERHAUL

C. Rectification of Leakage.

- (1) If leakage occurs from either of the unions at the bearing housing, proceed as follows, as appropriate, observing the different torque loadings for the two unions (Ref.Fig.506).
  - (a) At the feed tube union slacken and then torque-tighten the union between 220 and 240 lbf in. (24,8 and 27,1 N.m), using the cranked wrench (Tool 881).
  - (b) At the scavenge tube union slacken and then torque-tighten the union between 280 and 310 lbf in. (31,6 and 35,0 N.m) using cranked wrench (Tool 880).
- (2) If leakage occurs at a joint between the tubes at the inner end of the vanes No.3 and 4, disassemble the tube assembly at the bearing housing and at the inner end of the vane and remove the tube assembly. Inspect the condition of the sealing ring and renew if necessary. Inspect the surface finish of the mating faces for signs of scratching or other damage. If the condition appears satisfactory, repeat the assembly procedure and the pressure test procedure.

NOTE: No leakage, other than a surface wetness which does not form a drop within 30 minutes is acceptable.

D. Flow Check Outside Limits.

- (1) If the total oil flow is not within the defined limits the most likely cause is the filter assembly (72-01-01/1-10). The following checks should be made.
  - (a) Compare the flow check results again with the acceptance standards.
  - (b) Check that the filter element is not blocked.

SUB-ASSEMBLY

**72-20-00**

Page 529

Jul 1/81

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (c) If available repeat the flow check with another filter assembly.
- (2) If the filter assembly is not the cause, the fault may be displaced seals or gaskets, or foreign matter in the oil pipes, flanges or bearing housing. Systematic disassembly and examination will be necessary as follows:
- (a) Remove pressure test adapters from flanges at vane No.3 and vane No.4.
  - (b) Remove flanges and check that gaskets are not covering oil holes, and that the oilways are free of obstructions.
  - (c) Install alignment tool (Tool 878), disassemble inner oil tubes (Ref.4.F.(5)(b) and (c)) and check that seals are not deformed and oil tubes are clear of obstructions.
  - (d) Slacken the bolts of the seal clamps, disassemble the alignment tool from the manifolds and withdraw the outer oil tubes (Ref.4.F.(5)(a) and (d)).
  - (e) Remove the 10 bolts and nuts securing the bearing housing to the intake front flange and remove the bearing housing and inner baffle (Ref.4.D.).
  - (f) Remove the seven bolts from the bearing retainer and remove the retainer and bearing from the bearing housing. Examine the oilways in the bearing housing.
- (3) Thoroughly clean all components and reassemble following the procedures in the appropriate parts of this chapter. The oil leakage test (Ref.4.F.) and the pressure and flow tests (Ref.5.A. and B.) must be repeated.

OVERHAUL

E. Remove the Pressure Test Equipment from the Case.

- (1) Uncouple the feed pipe from the adapter at vane No.3, then unscrew the adapter from the flange. Screw the puller (Tool 888) into the filter and remove the filter from the flange. Wash the filter in clean white spirit, then re-assemble it to the flange and retain it with the protector (Tool 886).
- (2) Uncouple the return pipe from the outlet adapter at vane No.4, then unscrew the adapter from the flange, and assemble a suitable protector/blank.
- (3) Remove the twelve bolts securing the pressure test blank to the front face of the bearing housing (if fitted), then remove the centre nut and fibre washer. Remove the end plate and blank from the bearing housing.
- (4) Replace the pressure test equipment in the container (Tool 896).

## 6. Final Assembly of the Air Intake Case

A. Assemble the Labyrinth Housing and Baffle to the Case (Ref.Fig.504).

- (1) Assemble the labyrinth housing (72-23-01/1-140) to the rear of the bearing housing ensuring that they are to the correct standard (Ref.SB.72-46).

NOTE: It may be necessary to shrink the labyrinth housing in a freezing agent (Cardice for (approx.) 20 minutes or liquid nitrogen for (approx.) 2 to 3 minutes), prior to assembly in order to locate the spigot in the bearing housing bore.

- (2) Assemble the rear baffle (1-110) over the labyrinth housing to the rear faces of the inner baffle and air intake case.

SUB-ASSEMBLY

**72-20-00**

Page 531

Jul 1/81

MK.610-14-28  
OVERHAUL

- (3) Apply lubricant 'B' to the 45 retaining bolts (1-50, 90 and 100), then install the bolts to secure the baffle to the bearing housing/labyrinth, to the inner baffle and to the air intake case. Torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m), starting with the nine inner bolts.
- (4) Loosen the thumbnuts of the protector (Tool 882), then assemble the protector to the labyrinth housing. Locate the legs of the protector behind the labyrinth housing, then tighten the thumbnuts.
- (5) Assemble the protector (Tool 904) to the front inner flange of the air intake case and secure it with slave nuts.

B. Remove the Air Inlet Section from the Build Stand.

NOTE: Three methods are given for removing the air intake case from the build stand (Ref. para.(1), (2) and (3)). In general the method under para.(1) should be carried out prior to vertical engine assembly, but the alternative methods may be carried out as and when necessary.

- (1) Remove the air inlet section from the build stand and store the case on its front face.
  - (a) Invert the build stand so that the bottom face of the holding fixture is uppermost, then secure the shackles of the multiple leg sling (Tool 1255) to the eye-bolts of the fixture.
  - (b) Support the weight of the holding fixture with the lifting equipment, then release and remove the eight nuts and bolts securing the holding fixture to the build stand.
  - (c) Lower the air intake case and holding fixture onto a pallet, then release the swing clamps and securing bolts and remove the holding fixture from the air intake case.

OVERHAUL

- (d) If required, the holding fixture may be re-assembled to the build stand and secured with eight bolts and nuts.
- (2) Remove the air inlet section from the build stand and store the case on its rear face.
- (a) Position the air intake case in the build stand with its front face uppermost, then attach the hook of the lifting equipment to the ring of the lifting fixture (Tool 894).
- (b) Position the lifting fixture over the centre of the case, then locate the hooks of the fixture under three of the vanes of the case.
- (c) Release the swing clamps and bolts securing the case to the holding fixture, then lift the case away from the fixture and lower it onto the pallet (Tool 905).
- (d) Remove the lifting fixture from the air intake case and from the hoist.
- (3) Remove the air inlet section from the build stand for direct assembly to the engine in a horizontal position.
- (a) Turn the holding fixture on the stand until the flange faces of the air intake case are vertical with vane No.1 uppermost, then assemble the lifting fixture (Tool 890) to the top of the front flange. Position the retainer behind the front flange, then tighten the securing nut.
- (b) Attach the hook of the lifting equipment to the lifting ring of the fixture, then apply sufficient force to the lifting equipment to take the weight of the air intake case. Release the clamps and bolts securing the air intake case to the holding fixture.

- (c) Adjust the sliding lifting ring until the flange faces of the case are vertical, then position and attach the air inlet section to the LP compressor.

7. Machine the LP Compressor Front Bearing Retaining Plate

A. Prepare and Machine the Retaining Plate.

NOTE: The following operation may be required to prepare the retaining plate (72-23-01/1-100) (Ref.Fig.501) to suit assembly dimensions.

- (1) Locate face C of the retaining plate to a magnetic table.
- (2) Finish grind face D to achieve the dimension calculated for assembly.
- (3) Subject the plate to magnetic particle crack detection (Ref.72-23-01, Inspection/Check).
- (4) Ensure all burrs and sharp edges have been removed and that the surface finish is correct (Ref.72-09-00, Inspection/Check).

LP COMPRESSOR ASSEMBLY - SUB-ASSEMBLY

1. General

- A. Prior to commencing the sub-assembly, refer to 72-09-00 Assembly for general information.
- B. Throughout the text special tools are quoted by their Ref. No. e.g. (Tool 1234). For a complete list of tooling required for the assembly and balance, and for the manufacturers Part No., refer to the Special Tools, Fixtures and Equipment Table 1002.
- C. During the sub-assembly procedure, reference will be made to the Illustrated Parts Catalogue (I.P.C.) to identify those items where the nomenclature does not positively identify them, due to the duplication of the title e.g., nuts, bolts, washers, bearings, gears, housings etc. When an item is a part of the breakdown of the text concerned, the item will be identified e.g., bolt (1-10), the one referring to the I.P.C. Fig. No., and the 10 referring to the item No. To distinguish between the LP compressor case items, which are under breakdown 72-31-01, and the rotor items, under 72-31-03, the case items will be identified by their Fig. and Item No. only, but the rotor items will be prefixed by 03/ before their Fig. and Item No., e.g. (03/1-10).
- D. During the sub-assembly procedure, where the thickness of adjusting washers has to be determined, the words 'select' or 'select from the range' are used. If a range of washers is not available, it may be necessary to machine the washer to achieve the desired thickness. The information for machining washers is given under chapter 72-09-21 Repair. During the assembly procedure, the machining procedure reference will be given immediately after each adjusting washer I.P.C. Ref. No. in the appropriate part of the text e.g. select from the range the correct thickness adjusting washer (3-70) (72-09-21 Repair, Fig.401).
- E. This chapter details the work necessary for preparing the LP compressor assembly ready for engine final build. The assembly comprises the LP compressor case and vanes and the LP rotor, but in addition the LP thrust bearing assembly, which is allocated to the intermediate case section (72-32-00) is temporarily assembled to the LP rotor shaft rear for dimensional checks. After the check the LP bearing assembly is then returned to the intermediate section.

OVERHAUL

- F. The LP compressor case and vanes will be received from 72-31-01 Assembly, with the stage 6 vanes assembled and any necessary plugs and blanks assembled. The LP exit guide case with its vanes, plugs and blanks assembled will be received from 72-31-02 Assembly.
- G. The LP compressor rotor will be received from 72-31-03 Assembly, ready for assembly into the LP case. The blades will have been mass moment weighed, the bladed compressor disks balanced, the blades numbered for position and locked (as appropriate), and the datum points marked. Prior to the assembly of the bladed compressor disks to the casings, the No.1 datum blade of each stage may be painted to assist identification of blade positions when internal examinations of the LP compressor are carried out during the operation of the engine. Refer to Standard Practices 72-09-00 Assembly.
- H. Throughout the compressor build the assembly is supported on a slave bearing assembly, the work commencing with the stage 7 rotor disk and progressing forward.
- J. After completion of the build the compressor assembly is raised from its build stand then turned through 90 deg by means of supporting its rear end in a support stand and lowering to the horizontal position.
- K. Install compressor assembly to balancing machine and carry out swash and concentricity checks.
- L. On completion of satisfactory swash and concentricity checks, the compressor assembly will be dynamically balanced, removed from the machine then turned through 90 deg, rear bearing adapter uppermost. From this position the assembly is released from the front support stand then lowered into the mobile stand and transferred to the final build area. The front and rear balancing bearing adapters will be removed during the engine final build sequences.

## 2. Determine Engine and Slave Washer Sizes and Dimension 'G'

NOTE: On Pre-SB.72-21 standard engines, the LP compressor assembly is built with a slave adjusting washer of additional thickness, and the balancing bearing assembly will not have the oil thrower assembled. For Pre-SB.72-21 standard engines refer to para.B for adjusting washer procedure.

SUB-ASSEMBLY

72-31-00

Page 503

Dec 31/00

OLYMPUS 593

MK.610-14-28  
OVERHAUL

A. Assemble the Setting Gauge to the Rotor Shaft Rear  
(SB.72-21 Standard) (Ref.Fig.501).

- (1) Before proceeding with dimensional checks, ensure that items 03/3-180, 190, 200, 210 and 220 have been assembled to the rotor shaft rear (03/3-230).
- (2) Check that both the rotor shaft rear (03/3-230) and gauge (Tool 275) contact areas are clean and free from nicks or burrs, lightly stone if necessary.
- (3) Apply lubricant 'A' to the bearing area of the LP rotor shaft rear, then assemble the gauge (Tool 275) over the shaft. Push the gauge fully forward then turn 45 deg. in either direction and release so that the gauge engages under the lands of the spherical mounting.
- (4) Using slip gauges determine the distance between the front face of the gauge and the adjusting washer abutment face. Record this measurement as Dimension A. The adjusting washer required =

Dimension A - 0.5 in. (12,7 mm)

NOTE: The size of the adjusting washer is controlled by the part number and is raised by increments of 0.004 in. (0,101 mm) through the range, the last figure of the part number being raised by one for every 0.004 in. (0,101 mm) increment.

- (5) Remove the gauge and place in its container (Tool 698). Select the correct size adjusting washer (03/3-70) (72-09-21 Repair, Fig.401) from the range. Label the washer with the engine number and place to one side. Record the final thickness of the adjusting washer on the appropriate record sheet.

SUB-ASSEMBLY

**72-31-00**

Page 504

Apr 1/77

OLYMPUS 593

MK.610-14-28

OVERHAUL

- B. Mock Up Rotor Shaft Rear, Stage 6-7 Spacer Ring, Stage 7 Rotor Disk and Gauge to Determine LP Bearing Adjusting Washer (Pre-SB.72-21 Standard) (Ref.Fig.502).

NOTE: During the mock up of the assembly refer to Fig.503, 505 to 509 for guidance.

- (1) Place the support (Tool 1095) on the worktop, then assemble the stage 7 rotor disk (03/3-340) to the support with the leading edge of the blades uppermost.
- (2) Assemble the stage 6-7 spacer ring (03/3-270) to the rotor disk aligning the smaller holes of the spacer with those of the rotor disk. Temporarily secure the spacer with six equi-spaced bolts (03/3-310) and nuts (03/3-260).
- (3) Insert six equi-spaced bolts (03/3-250) through the rear of the spacer (bolts to extend forward), then screw an assembly pin (Tool 1067) onto each of the six bolts.
- (4) Assemble the lifting fixture (Tool 1017) to the rotor shaft rear (03/3-230), then attach the overhead hoist to the fixture.
- (5) Assemble the rotor shaft rear to the stage 6-7 spacer ring, then pull the six bolts through the spacer and shaft and retain with the spring clips (Tool 1038). Remove the hoist then remove the lifting fixture.
- (6) Turn the turnover stand (Tool 697) so that the ring of the lifting plate is uppermost. Attach a hoist to the mounting plate (part of tool 697), then release the mounting plate from the turnover stand and transfer it to the mock up. Lower the plate over the six bolts; then assemble six slave nuts (not self-locking) to the bolts, remove the retaining clips then tighten the bolts.

OVERHAUL

- (7) Attach the overhead hoist to the ring of the lifting plate, then raise the lifting plate/rotor shaft assembly and transfer it to the turnover stand.
- (8) Centralise the assembly over the turnover stand, then lower the assembly to locate it on the locating pegs of the stand. Finally secure the mounting plate to the stand with the four pivoting bolts and nuts (Ref.Fig.509).

NOTE: Although Fig.509 represents a final build sequence, it may be referred to for the 'mock up' as a guide for assembling the 'mock up' to the build stand.

- (9) With the 'mock up' assembly secure in the build stand, release the hook of the hoist from the lifting ring of the mounting plate, then using the turnover stands cranked handle, turn the assembly until the rotor shaft rear is uppermost.
- (10) Ensure that the adjusting washer abutment face on the rotor shaft rear is clean, then apply lubricant 'A' to the bearing location.
- (11) Assemble the setting gauge (Tool 72) (Ref.Fig.502) to the rotor shaft so that the leg on the outer extremity of the gauge extends towards the rim of the stage 7 rotor disk. Screw the special nut (Tool 143) onto shaft to secure the gauge.
- (12) Using slip gauges, measure the distance between the rim of the stage 7 rotor disk and the setting gauge, then record the measurement as Dimension X (Ref.Fig.502).

NOTE: It is important that the dimension is taken from the rim of the disk and not the rear of the stage 7 rotor blade platform.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

sneema

- (13) Calculate and record dimension A, which is the distance from the washer abutment face to the rim of the stage 7 rotor disk.

$$\text{Dimension A} = 1.250 \text{ in. (31,750 mm)} - X$$

Where 1.250 in. (31,750 mm) is the setting gauge (Tool 72) working dimension and X is the dimension obtained in para.(12).

NOTE: Dimension A is required to calculate the LP bearing adjusting washer and the balancing bearing adjusting washer.

CAUTION: THE ENGINE WASHER AND SLAVE WASHER ON PRE-SB.72-21 STANDARD ENGINES CANNOT BE USED IN LIEU OF EACH OTHER SINCE THEIR DIMENSIONS WILL NOT BE THE SAME.

- (14) Obtain and record from 72-32-00 Assembly the B dimension which is the distance from the front face of the LP exit guide case flange (with the cases assembled to the intermediate case), to the front face of the LP oil thrower with the thrust loaded fully forward.
- (15) Calculate and record the thickness of the LP bearing adjusting washer (03/3-70).
- $$\text{Washer thickness} = B - (1.727 \text{ in. (43,865 mm)} - A)$$
- Where 1.727 in. (43,865 mm) is the mean engine setting dimension, A is the dimension obtained in para.(13) and B obtained from para.(14).
- (16) Select the correct thickness adjusting washer (03/3-70) (72-09-21 Repair, Fig.401) from the range, log its actual thickness on the appropriate record sheet then suitably identify the washer and place to one side.
- (17) Unscrew and remove the special nut from the rotor shaft rear, then remove the gauge and place both items in a container.

OVERHAUL

sneema

- (18) Ensure that the assembly is secure in the turnover stand, then using the cranked handle, turn the stand until the lifting/mounting plate is uppermost.
  - (19) Attach the overhead hoist to the ring of the lifting plate, then release the four bolts retaining the lifting plate. Carefully raise the lifting plate/rotor shaft rear assembly from the build stand, then transfer the assembly to the support (Tool 1095) and release the hook of the hoist.
  - (20) Disassemble the 'mock up' components using the lifting fixture (Tool 1017) to lift out the rotor shaft rear, then remove the lifting fixture. Place the rotor shaft rear stage 7 rotor disk and 6-7 spacer ring in their respective containers.
- C. Assemble the Adjusting Washer and LP Bearing Assembly to Rotor Shaft Rear (Ref.Fig.503).

NOTE: The items in this operation are temporarily assembled for the purpose of the dimensional check to assist the intermediate case build personnel in calculating the LP probe adjusting washers. The operator may choose to carry out the dimensional check during engine assembly (Ref. Assembly 72-00-00 para.7A), in which case ignore the following and paragraphs 2D and 2E and proceed to para.2F.

- (1) If not already in position assemble the mounting plate (Tool 1294) to the turnover build stand (Tool 697), then turn the build stand (if necessary) so that the mounting plate abutment face is uppermost.
- (2) Assemble and secure the lifting fixture (Tool 806) to the rotor shaft rear (03/3-230).
- (3) Using the overhead hoist, transfer the rotor shaft rear to the mounting plate assembled to the build stand, then secure the shaft with slave bolts and nuts. Release and remove the lifting fixture (Tool 806).
- (4) Assemble the previously calculated adjusting washer (03/3-70) (Ref.para.A.(4) or para.B.(15) for Pre-SB.72-21 standard) to the rotor shaft rear.

- (5) Remove the LP thrust bearing assembly from its protective container then check the following:
  - (a) The LP bearing housing (72-32-00/1-270) engine symbol.
  - (b) The correct size oil thrower (72-32-00/1-200) has been assembled.
  - (c) The thrust arrows on the bearing (72-32-00/1-190) inner tracks when aligned, point towards the oil thrower.
  - (d) The bearing retaining plate (72-32-00/1-170) is seating correctly.
- (6) Apply a small quantity of lubricant 'A' to the bearing area of the rotor shaft rear. Raise the LP bearing assembly, then position the assembly so that the bearing rests squarely on the rotor shaft rear.
- (7) Ensure that the adapter (Tool 284) is screwed onto the centre thrust plate of the mechanical driver (Tool 1099), then lower the driver onto the rotor shaft and screw the adapter onto the shaft ensuring that it is not overtightened. Turn the 'T' handle in a clockwise direction and press the bearing home. Unscrew and remove the mechanical driver.

NOTE: If Tool 1100 is not available, then items 72-32-00/1-40 and 1-50 may be used in its place.
- (8) Ensure the probe operating ring (03/3-40) is to SB.72-95 standard.

OVERHAUL

- (9) Assemble a slave packing piece (Tool 1100) to the rotor shaft rear, this takes the place of the LP bevel gear and washer, then assemble the locking washer (03/3-60). Apply lubricant 'B' to the threads of the plain round nut (03/3-50), then assemble the nut to the shaft and tighten with a hand wrench (Tool 1551).
- (10) Ensure four pins (03/3-30) have been assembled to the probe ring then assemble the probe ring (03/3-40) and locking washer (03/3-20) to their correct position on the rotor shaft rear. Apply lubricant 'B' to the threads of the retaining nut (03/3-10), then assemble the nut to the shaft.
- (11) Insert the sleeve (Tool 696) into the rotor shaft rear, then locate the immobilizer (Tool 1330) in the rotor shaft internal splines. Assemble the wrench (Tool 325) to the retaining nut, then lower the multiplier (Tool 1333) onto the wrench engaging the drive in the immobilizer and the spigots in the wrench. It may be necessary to turn the multiplier drive to engage it in the immobilizer.
- CAUTION: CHECK THE INPUT OUTPUT RATIO ON THE MULTIPLIER.
- (12) Using a torquemeter wrench, torque-tighten the probe ring retaining nut between 300 and 330 lbf ft (407 and 448 N.m). Remove the multiplier, wrench, immobilizer and sleeve from the rotor shaft rear.
- (13) Assemble and secure the lifting fixture (Tool 806) to the rotor shaft rear then attach a hoist to the fixture. Release and remove the slave nuts and bolts securing the rotor shaft rear to the mounting plate, then operate the hoist and position and lower the shaft onto the support (Tool 805). Release and move the hoist and lifting fixture.

OVERHAUL

D. Measure Dimension 'G' (Post and Pre-SB.72-21 Standard)  
(Ref.Fig.503).

- (1) Assemble the checking gauge (Tool 43) to the LP bearing housing (72-32-00/1-270) rear inner abutment face.
- (2) Adjust the gauge so that the arm of the gauge contacts the rear inside face of the probe ring lug, then lock the gauge in this position.
- (3) Remove the gauge, then by direct measurement, measure from the top of the arm to the LP bearing/gauge abutment face, record this as dimension G. Place the gauge in its container (Tool 824).

E. Disassemble Items from Rotor Shaft Rear.

- (1) Assemble the lifting fixture (Tool 806) to the rotor shaft rear, then using the overhead hoist, transfer the shaft and LP bearing assembly to the turnover stand (Tool 697) mounting plate. Secure the shaft to the mounting plate with bolts and nuts. Remove the lifting fixture.
- (2) Insert the sleeve (Tool 696) into the rotor shaft rear, then locate the immobilizer (Tool 1330) in the rotor shaft internal splines. Assemble the wrench (Tool 325) to the retaining nut, then lower the multiplier (Tool 1333) onto the wrench engaging the drive in the immobilizer and the spigots in the wrench. It may be necessary to turn the multiplier drive to engage it in the immobilizer.
- (3) Using a wrench, de-torque the probe ring retaining nut. Remove the multiplier, wrench, immobilizer and sleeve. Remove the retaining nut and probe.

OVERHAUL

- (4) Using the hand wrench (Tool 1551), unscrew and remove the LP thrust bearing plain round nut (03/3-50), then remove the packing piece (Tool 1100) or bevel gear and washer.
- (5) Lift the mechanical puller (Tool 283) onto the shaft, then screw the central adapter onto the shaft threads (do not overtighten). Retain the puller at the outer location to the bearing housing.
- (6) Turn the 'T' piece of the puller clockwise to remove the bearing assembly, then place the bearing assembly in a protective container. On engines to Pre-SB.72-21 standard ensure that the engine washer is removed, labelled and placed in a container.
- (7) Assemble and secure the lifting fixture (Tool 806) to the rotor shaft rear, then attach a hoist to the fixture. Release and remove the slave nuts and bolts securing the shaft to the mounting plate, then using the hoist, transfer the rotor shaft rear to a worktop. Release and remove the hoist and lifting fixture. If work is not to be continued immediately, assemble protectors to the rotor shaft rear.

**F. Mock Up Balancing Bearing Adapter/Balancing Bearing Assembly and Slave Exit Guide Vane Cases to Determine Slave Adjusting Washer (Ref.Fig.505).**

- (1) Ensure the bearing adapter abutment face on the build stand (Tool 1093) is clean and also the corresponding abutment face on the rear bearing adapter (Tool 344).
- (2) Using suitable lifting equipment, attach it to the rear bearing adapter, then using the overhead hoist position the adapter so that the front face of the adapter is uppermost. Release the lifting equipment.

- (3) Using suitable lifting equipment, attach it to the front of the rear bearing adapter, then using the overhead hoist raise the adapter and position it square above the build stand (Tool 1093). Lower the rear bearing adapter onto the build stand positioning the locators correctly. Remove the lifting equipment.
- (4) Clean the balancing bearing outer (Tool 3163) rear flange and the corresponding front inner flange of the bearing adapter, then assemble the balancing bearing assembly to the rear bearing adapter. Temporarily retain the balancing bearing assembly with the captive bolts.
- (5) Obtain the slave exit guide vane (e.g.v.) cases (Tool 398) ensuring they are a matched set, then assemble them to the front face of the rear bearing adapter and temporarily retain them with slave bolts and nuts.
- (6) Clean the front flange of the slave e.g.v. cases, then place two machine blocks diametrically opposite each other on the flange. Position a straight edge across the blocks.
- (7) Measure from the front face of the e.g.v. case flange to the front face of the inner track of the slave bearing, then record the dimension. Repeat the measuring on the opposite side of the inner track. Reposition the block and straight edge 90 deg then obtain two more measurements. Obtain the mean dimension from the four results and record as dimension K.
- (8) Determine the end-float of the balancing bearing, then subtract the end-float dimension from dimension K (Ref.para.(7)) and record the resultant dimension as M.

SUB-ASSEMBLY

- (9) Calculate and record the required balancing bearing adjusting washer (Tool 345) thickness.

$$\text{Washer thickness} = M - (1.727 \text{ in. (43,865 mm)}) - A$$

Where 1.727 in. (43,865 mm) is the mean engine setting dimension, M is the dimension obtained in para.(8) and A is the dimension obtained in para.B.(13).

- (10) Remove the straight edge, machine blocks and place in a container.
- (11) Disassemble the slave e.g.v. case and place them as a matched set on a pallet.
- (12) Remove the balancing bearing assembly from the rear bearing adapter, then place the bearing assembly in a protective container.
- (13) Using the lifting equipment, remove the rear bearing adapter from the build stand and place on a pallet.
- (14) Proceed with the build (Ref.para.3) observing the Pre-SB.72-21 references.

### 3. Assemble the Stage 7 Rotor Disk and the Stage 6-7 Spacer Ring to the Rotor Shaft Rear

- A. Prepare the Disk, Spacer Ring, Rotor Shaft Rear and Bolts.

NOTE: Where no specific instruction has been given to remove protectors from components, it is assumed that the protector will be removed prior to the assembly of the component.

- (1) If not already in position, assemble a protection/retaining band (Tool 1129) to the rotor blades. Check that the front and rear abutment faces of the disk (03/3-340) and spacer ring (03/3-270) are clean and free from damage marks, lightly stone if necessary. Lightly stone the disk abutment face of the rotor shaft rear (03/3-230). Check that the labyrinth seal on the spacer ring is undamaged.

OVERHAUL

B. Assemble the Stage 7 Rotor Disk and 6-7 Spacer Ring.

**CAUTION:** PREVIOUSLY USED BOLTS (03/3-310) MUST BE  
DISCARDED AND REPLACED WITH 24 NEW ITEMS.

- (1) Apply lubricant 'B' to 24 bolts (03/3-310), then place a support (Tool 1095) onto a worktop. Assemble the multiple leg sling (Tool 1217) to the front face of the stage 7 rotor disk (03/3-340) with the leading edge of the rotor blades uppermost and secure the sling to the disk with four slave bolts (Tool 1164). Attach a hoist to the sling, then position and lower the rotor disk onto the support (Ref.Fig.504). Release and remove the hoist and sling.
- (2) Release and remove the protector (Tool 1170) from the stage 6-7 spacer ring, then assemble the spacer ring to the stage 7 rotor disk with the front face of the ring uppermost, identified by aligning the smaller holes with the corresponding small holes in the rotor disk. Ensure that the datum markings on the spacer ring correlate with the datum markings on the rotor disk.

**NOTE:** All datums coincide with the No.1 rotor blade, and No.1 bolt-hole, and all true datums throughout the rotating assembly are defined by two circles with an arrow each side pointing towards the circles → 00 ←. It is most important to check all datum positions before and after every build sequence.

- (3) With the stage 6-7 spacer ring correctly assembled, insert a bolt (03/3-310) through the rear of the disk into the 6-7 spacer ring, retain the bolt in position with a locking nut (03/3-260). Proceed in a clockwise direction with the remaining 23 bolts and nuts. Run each nut down the bolt threads until the nuts 'nip' the spacer ring flange. Check that the bolt platforms are correctly located in the rear of the stage 7 rotor disk.

SUB-ASSEMBLY

72-31-00

Page 519

Dec 1/95

**OLYMPUS 593**MK.610-14-28  
OVERHAUL

sneema

**CAUTION:** IT IS OF THE UTMOST IMPORTANCE THAT THE SPECIFIED TORQUE VALUES FOR BOLTS (03/3-310) ARE ADHERED TO.

- (4) Using a torque wrench (Tool 1612) tighten the 24 bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m) in the following sequence: 1, 13, 7, 19, 4, 16, 10, 22, 2, 14, 8, 20, 5, 17, 11, 23, 3, 15, 9, 21, 6, 18, 12 and 24. Locking (run-down) torque 3.5 lbf in. (0,4 N.m).
  - (5) After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 1.5 thread pitches beyond nut chamfer, the bolt must be renewed (Ref.SB.72-8449-191).
  - (6) Insert a bolt (03/3-250) into a bolt-hole in the front flange of the stage 6-7 spacer with the bolt head facing to the rear. Screw an assembly pin (Tool 1067) onto the bolt, then allow the bolt to move rearward and rest on the nuts securing the 6-7 spacer ring and stage 7 disk. Continue in a clockwise direction with the remaining 23 bolts (Ref.Fig.506).
- C. Assemble the Rotor Shaft Rear to the Spacer Ring/Rotor Disk Assembly (Ref.Fig.507).
- (1) Slacken the thumbnut on the lifting fixture (Tool 1017) sufficiently to disengage the sliding arm, then assemble the lifting fixture to the larger diameter of the rotor shaft rear. Engage the sliding arm into one of the slots in the locking cone, then lock the arm with the thumbnut. Attach the overhead hoist to the lifting fixture, then raise the rotor shaft rear (03/3-230) above the assembled 6-7 spacer ring and stage 7 rotor disk. Align the datum symbols marked on the 6-7 spacer ring with the datum marks on the periphery of the rotor shaft rear, which will line up with the No.1 blade slot (Ref.Fig.507).
  - (2) Carefully lower the rotor shaft over the assembly pins until the rotor shaft abutment face contacts the spacer ring. Check that the datum symbols on the stage 7 rotor disk, 6-7 spacer ring and the rotor shaft are in line. Remove the hoist and lifting fixture.
  - (3) Pull an assembly pin through the rotor shaft rear until the bolthead abuts its location in the spacer ring, then assemble a spring retaining clip (Tool 1038) ensuring the "L" shape tang faces outward. Pull the remaining 23 bolts through into position assembling a retaining clip to each bolt.

4. Assemble the Rotor Shaft Rear Spacer Ring/Disk Assembly to the Turnover Stand

A. Assemble the Mounting Plate to Rotor Shaft Rear  
(Ref.Fig.508).

- (1) Turn the turnover stand (Tool 697) until the mounting plate is uppermost. Attach the overhead hoist to the lifting ring of the mounting plate, then unscrew the nuts securing the mounting plate to the turnover stand. Raise the mounting plate clear of the turnover stand.
- (2) Transfer the mounting plate to the rotor shaft/spacer ring/disk assembly. Raise the mounting plate above the assembly, align the assembly pins with the mounting plate bolt-holes, then lower the plate onto the rotor shaft abutment face. Slight adjustment of the retaining clips may be necessary so that they locate freely in the accommodating slots machined in the rear face of the mounting plate.
- (3) Assemble slave nuts to four bolts at four equi-spaced positions. Remove the spring retaining clips at these positions, then tighten the four slave nuts.

B. Secure the Assembly to the Turnover Stand (Ref.Fig.509).

- (1) Raise the assembly from the worktop, then transfer it to the turnover stand (Tool 697).
- (2) Depress the pedal controlling the lock on the trunnion arm, then turn the cranked handle of the turnover stand to bring the moveable arm into its uppermost position.
- (3) Release the locking pin securing the trunnion arm, then reposition the arm to its uppermost position. Lock the arm. Lower the rotor shaft/spacer ring/disk assembly onto the trunnion arms (Ref.Fig.509) taking care not to damage the stage 7 blades against the stand. Secure the assembly to the trunnion arms with slave nuts and washers. Disconnect the hoist.

OVERHAUL

- (4) Pull the locking pin to release the trunnion arm, turn the thumbscrew on the pin to retain the pin in the unlocked position. Depress the pedal controlling the lock on the opposite trunnion arm, then turn the stand through 180 deg so that the rotor disk is uppermost. Lock the trunnion arms by operating the foot pedal in conjunction with the locking pin.

5. Assemble the Balancing Bearing Assembly and the Rear Bearing Adapter (Part of Tool 3163)

NOTE: Remove protector assemblies (Tools 3161 and 3162) before proceeding.

A. Assemble the Balancing Bearing Assembly (Ref.Fig.510).

- (1) Apply lubricant 'A' to the bearing surface of the rotor shaft rear.
- (2) On engines to SB.72-21 standard, assemble the correct size adjusting washer (03/3-70) previously determined in para.2.A.(4) to the rotor shaft rear. On engines to Pre-SB.72-21 standard assemble the slave adjusting washer (Tool 345) previously calculated in para.2.F.(8) to the rotor shaft rear.

NOTE: If an adjusting washer (03/3-70) of the size required is not available, then a slave washer of the same size may be used providing that the washer is clearly marked 'slave' and marked with red paint on its periphery. The correct size engine washer must be assembled during 72-00-00, Assembly.

- (3) Offer the balancing bearing assembly part of Tool 3163 on engines to SB.72-21 standard or Tool 346 on engines to Pre-SB.72-21 standard, to the rotor shaft rear, positioning the bearing so that it rests square with the shaft (Ref.Fig.510). Screw the mechanical driver (Tool 1099) clockwise onto the shaft threads ensuring it is not overtightened. Turn the 'T' handle in a clockwise direction, and press the balancing bearing onto the adjusting washer abutment face (Ref.Fig.511). Unscrew and remove the driver.

OVERHAUL

- (4) Assemble spacer sleeve (Tool 3159) to the rotor shaft rear. Assemble mechanical driver (Tool 1099). Turn the 'T' handle in a clockwise direction and press the spacer sleeve (Tool 3159) onto the balancing bearing (Part of Tool 3163). Unscrew and remove the driver.
- (5) Assemble locking washer (03/3-60) to the rotor shaft rear. Lubricate the bearing retaining nut (03/3-50) with lubricant 'B', then assemble the nut to the shaft and tighten with the hand spanner (Tool 1551).

- B. Torque-Tighten the Balancing Bearing Retaining Nut (Ref.Fig.512).

CAUTION: BEFORE USE CHECK THE INPUT AND OUTPUT TORQUE RATIO MARKED ON MULTIPLIERS.

- (1) Insert a sleeve (Tool 696) into the rear of the rotor shaft rear, then locate the immobilizer (Tool 280) in the rotor shaft internal splines. Ensure that the spanner (Tool 1594) is bolted to the multiplier (Tool 1022), then assemble the spanner to the nut and the multiplier to the immobilizer. It may be necessary to turn the square in the top of the multiplier to engage the square of the immobilizer. Assemble a torque wrench to the multiplier, then torque-tighten the retaining nut between 650 and 700 lbf ft (881 and 949 N.m). Remove the torque wrench, multiplier/spanner, immobilizer and sleeve. Do not lock the locking washer.

- C. Assemble the Rear Bearing Adapter (Tool 3163) (Ref.Fig.513).

NOTE: The following operation is carried out to avoid the possibility of discovering a tight location sleeve at a later stage.

- (1) Assemble a location sleeve (Tool 628) to the rotor shaft rear ensuring that the sleeve engages without difficulty. If however the sleeve is tight, then the sleeve must be removed from the rotor shaft and an alternative sleeve trial assembled. After a successful trial assembly, assemble the sleeve to the build stand (Tool 1093).

- (2) Assemble the lifting fixture (Tool 1096) to the rear bearing adapter (Tool 1011 on engines to SB.72-21 standard, or Tool 344 on engines to Pre-SB.72-21 standard), retain the lifting plate with four captive bolts. Attach the overhead hoist to the lifting fixture, then raise the adapter and position it above the rotor shaft assembly in the turnover stand.
- (3) Lower the bearing adapter sufficiently to allow the retaining bolts to be correctly aligned. After aligning the bolts, carefully lower the bearing adapter to within 0.5 in. (12,7 mm) of its abutment, then engage the 10 captive bolts of the balancing bearing in the pillar nuts of the rear bearing adapter. Lower the bearing adapter onto the balancing bearing abutment flange and tighten the 10 captive bolts. Remove the lifting fixture from the adapter.
- (4) Assemble immobilisers (Tools 3157 and 3158). Relocate the lifting fixture (Ref.Fig.513A).

6. Assemble the Rear Bearing Adapter and Rotor Shaft Assembly to the Build Stand

A. Remove the Assembly from the Turnover Stand.

- (1) Unlock the trunnion arms and turn the stand (Tool 697) through 180 deg until the mounting plate is uppermost then lock the trunnion arms.

CAUTION: EXERCISE CARE WHEN TAKING UP WEIGHT OF ASSEMBLY WHEN MOUNTING PLATE IS BOLTED TO STAND.

OVERHAUL

- (2) Attach the overhead hoist to the lifting ring of the mounting plate, then raise the hoist sufficiently to take up the weight of the rotor shaft and rear bearing adapter assembly.
- (3) Release the nuts securing the mounting plate, then allow the bolts to pivot outwards releasing the plate. Carefully raise the assembly sufficiently to clear the trunnion arms, then traverse the hoist to clear the stand taking care not to damage the stage 7 rotor blades.
- (4) Operate the hoist and transfer the assembly to the compressor build stand (Tool 1093). Wipe the build stand outer flange clean and lightly stone if necessary, then clean the corresponding abutment face on the rear bearing adapter. Check that the location sleeve (Tool 628) has been assembled to the centre of the build stand (Tool 1093) (Ref.para.5.C.(1)).
- (5) Position the assembly over the build stand, turn the assembly so that the master spline in the rotor shaft rear falls in line with one of the four cut outs machined on the outside of the location sleeve (Tool 628).

NOTE: During the lowering of the assembly onto the build stand it will not be possible to observe the master spline, providing the assembly is not turned again the No.1 blade can be used as a guide as this lines up with the master spline (Ref.Fig.514).

CAUTION: DO NOT REMOVE THE MOUNTING PLATE (TOOL 1294) AS IT SUPPORTS THE STAGE 7 ROTOR DISK/SPACER RING ASSEMBLY AT THIS STAGE.

- (6) Lower the assembly engaging the internal splines of the rotor shaft rear with those of the location sleeve. Align the dowels in the rear face of the rear bearing adapter with the corresponding dowel holes machined through the build stand outer flange, then lower the assembly onto the build stand. Secure the assembly with the slave captive nuts and bolts assembled to the rear bearing adapter and build stand. Use a 0.002 in. (0,050 mm) feeler gauge and check that no gap exists between the build stand and the rear

OVERHAUL

bearing adapter abutment flanges. If a gap exists between the flanges, release the slave retaining bolts and raise the assembly sufficiently to rectify. Lower the assembly, secure with the slave captive nuts and bolts, then recheck the gap. Remove the hoist and the protection band from the stage 7 rotor blades.

B. Check the Swash of the Rear Bearing Adapter.

- (1) Attach a clock indicator to the pillar at one end of the mounting plate and adjust the indicator to contact the rear bearing adapter, then set the dial to read zero. Unlock the rotor shaft by lifting the lever assembled to the build stand.
- (2) Turn the rotor shaft assembly clockwise and plot the readings at 8 equi-spaced positions. The maximum swash reading obtained must not exceed 0.006 in. (0,152 mm). Move the clock indicator clear of the adapter to allow assembly of exit guide vane cases. If the swash is excessive, investigate the cause and rectify, then recheck the swash.

7. Check the Stage 7 Rotor Blade Tip Clearances

A. Assemble the Exit Guide Vane Cases.

- (1) Check the serial No. of both halves of the exit guide vane cases (72-31-02/1-150) with the engine record sheets. Wipe clean the front and rear flanges of the top half case. Remove the protection/retaining band (Tool 1129) from the stage 7 rotor blade tips.

NOTE: The top half case is identified by the two dowel location holes in the front and rear flanges at the 'TOP' position.

OLYMPUS 593

MK.610-14-28

OVERHAUL

PRINTED IN ENGLAND

- (2) Insert the top half of the exit guide vane case (1-150) between the rear bearing adapter and stage 7 rotor, with the convex surface of its stator vanes uppermost. Slide the case around the rear bearing adapter until the 'TOP' of the case aligns the 'TOP' of the rear bearing adapter. Retain the case with slave bolts and nuts. Ensure that the abutment faces are clean at the exit guides four axial flanges, then assemble the bottom half exit guide vane case (1-150) to the rear bearing adapter. Retain in position with slave bolts and nuts (Tool 559) at the two axial positions and rear exit guide flange/adapter plate location (Ref.Fig.515).
- (3) Reposition the clock indicator to engage it with the exit guide vane case flange (Ref.Fig.516), then check the swash at eight equi-spaced positions. The swash should not exceed the rear bearing adapter swash of 0.006 in. (0,152 mm). Remove the clock indicator.
- (4) Using feeler gauges check the tip clearance between the stage 7 rotor blades and the exit guide cases (Ref.Fig.517). Find the longest and shortest blades, then check the max. and min. tip clearance at eight equi-spaced positions. From the check determine the average max. and min. tip clearance. Refer to the Fits and Clearances Schedule (72-30-00) FCS 31.
- (5) Release and remove the two exit guide cases from the rear bearing adapter and place on a suitable pallet. Identify the cases with their respective engine No.

8. Assemble the Slave Exit Guide Vane Cases to the Rear Bearing Adapter

NOTE: The rear bearing adapter and the slave exit guide vane cases are a matched set, and must be retained as a set, and assembled together in the positions marked on the items.

OVERHAUL

A. Assemble the Cases to the Build Stand.

- (1) Insert the two halves of the slave exit guide vane cases (Tool 398) between the rear bearing adapter and stage 7 rotor, aligning the assembly marks and bolt-holes. Secure the items together with the slave bolts and nuts (Tool 559).

B. Assemble Supports to the Rear Bearing Adapter (Ref.Fig.518).

- (1) Remove three equi-spaced blanking plates from the slave exit guide vane cases, then insert three supports (Tool 1006) through the apertures and rest them on the raised machined platforms within the rear bearing adapter (Ref.Fig.518).
- (2) Position each support so that they will abut the rim, (not the blade platform), of the stage 7 rotor disk when the mounting plate is removed.

C. Remove the Mounting Plate from the Rotor Shaft Rear.

- (1) Unscrew and remove the slave nuts securing the mounting plate to the rotor shaft rear and place the nuts in a container.
- (2) Attach the overhead hoist to the ring of the mounting plate, then slowly raise the plate, taking care not to foul the assembly pins. Transfer the mounting plate to the turnover stand (Tool 697) and secure the plate to the stand, then remove the hoist.

9. Assemble the LP Compressor Case to the Slave Exit Guide Vane Cases (Ref.Fig.518)

A. Prepare the LP Compressor Case.

- (1) Check that all work has been completed on the LP compressor case at the sub-assembly stage, and that the case has the appropriate inspection clearance certificate attached.

- (2) Assemble the three blocks of the multiple leg sling (Tool 1101) (Ref.Fig.518) to the front face of the LP compressor case, ensuring the blocks are evenly spaced. Attach a hoist to ring of the sling. Raise the LP case to a convenient height, then wipe clean the rear flange and inspect for damage. Lightly stone any nicks or burrs. Wipe clean the front face of the slave exit guide vane cases assembled to the rear bearing adapter.
- (3) Observe the datum markings on the periphery of the rotor shaft rear, then suitably mark the inside of the shaft at the datum position so that the datum position can be easily identified when the case is in position.

B. Assemble the LP Compressor Case.

CAUTION: EXERCISE CARE WHEN LOWERING CASE AND STAGE 6 STATOR VANE ASSEMBLY OVER STAGE 6-7 SPACER RING TO AVOID DAMAGE TO THE SPACER RING LABYRINTH.

- (1) Position the LP compressor case (6-100) over the build stand (Tool 1093). Align the dowel hole in the case rear (bottom) flange with the pin in the slave exit guide vane case, then lower the case engaging the pin and aligning the attachment holes. Secure the case to the slave exit guide case with slave bolts and nuts. Release and remove the sling from the hoist and compressor case.
- (2) Operate the control governing the raising and lowering of the ramp and lower the ramp so that the stage 6 rotor disk can be worked on in a favourable position. Ensure that brackets assembled to the case do not foul the build platform boards when raising or lowering the ramp.

OVERHAUL

- (3) Using two sets of feeler gauges, check the clearance between the stage 6-7 spacer ring labyrinth and the stage 6 vane fixing ring. Carry out this check by inserting 0.025 in. (0,635 mm) feelers between the labyrinth and ring, then insert the required amount of feelers to measure the remaining clearance between the labyrinth and ring at a point diametrically opposite the first set of feeler gauges. Take the total of the two sets of feelers as the clearance. Carry out the check at three more equi-spaced positions, then take the average of the four readings. The clearance must be within the dimensions quoted in the Fits and Clearances Schedule (72-30-00) FCS 41.
- (4) If the assembly is not to be continued immediately, place the protector/blank (Tool 1684) over the stator vanes.

#### 10. Assemble Stages 6 to 1 Rotor Disks, Spacer Rings and Labyrinth Seals

##### A. Assemble the Stage 6 Rotor Disk and Stage 5-6 Spacer Ring.

- (1) Identify the datum position in the rotor shaft rear, then mark the assembly pin in that hole so that the datum hole is readily identified. Adjust the assembly pins so that they remain in a vertical position.

NOTE: Although disks and spacer rings will assemble in alternative positions, any accidental deviation from the datum during build will result in disassembly of the compressor.

- (2) Assemble the lifting fixture (Tool 1161) (Ref.Fig.519) to the front face of the stage 6 rotor disk (03/2-180) by guiding the three claws of the fixture through the centre hole of the disk, then turn the claws outward to lock and locate on the rear face of the disk. Screw down the three thumbnuts to secure the claws in the locked position.

- (3) Remove the protection band (Tool 1128) from the tips of the rotor blades, and if assembled, the protector/blank (Tool 1684) from the stator vanes. Attach the overhead hoist to the lifting fixture, then raise the hoist positioning the rotor disk over the case (Ref.Fig.519). Mark the datum position on the front face of the disk in line with No.1 bolt-hole with suitable chalk.
- (4) Insert an alignment rod (Tool 380) into the datum position assembly pin (Tool 1067), then align the datum position of the stage 6 rotor disk with the rod (Ref.Fig.519). Lower the stage 6 rotor disk until the rod passes through its datum hole and protrudes a few inches. Centralize the rotor disk with the case, then insert rods through the remaining 23 bolt-holes to locate in the assembly pins assembled to the bolts below (Ref.Fig.520). Carefully lower the disk guiding it onto the assembly pins (Ref.Fig.521) until it abuts the rotor shaft. Withdraw the alignment rods from the assembly pins and place the rods in a container. Place a protector/blank (Tool 1684) over the blades of the rotor.
- (5) Remove the hoist but leave the lifting fixture in the rotor disk bore to act as a blank.
- (6) Turn the assembly pins (if necessary) so that the flat on the bolthead is in line with the wall of the spacer ring, pull on each assembly pin until all of the thread and waisted portion of each bolt is visible, then clip the retaining clips (Tool 1038) into the waisted portion of the bolt, with the clips pointing towards the centre of the disk (Ref.Fig.522). Unscrew and remove the assembly pins from the bolts. If any of the bolts are too tight to pull up with their assembly pins, screw the mechanical driver (Tool 1064) (Ref.Fig.522) onto an assembly pin, then insert the locating key (Tool 1079) into the assembly pin locating the key into the slot in the bolt. Lock the locating tool by screwing the thumbnut onto the assembly pin, then turn the locating tool handle until it points to the centre of the rotor. This aligns

the flat on the bolthead with the wall of the spacer ring. Screw down on the driver tommy bars and draw the bolt up until it abuts the spacer ring front flange. Release and remove the locating key and mechanical driver, then clip a retaining clip (Tool 1038) onto the waisted portion of the bolt. Remove the assembly pin. Repeat the procedure on any tight bolts.

- (7) Release and remove the protector (Tool 1169) from the stage 5-6 spacer ring (03/2-150), then turn the spacer ring so that the labyrinth on its circumference is nearer the rotor disk. Establish the datum hole in the bottom flange, align the datum holes of the spacer ring and disk (by a chalk mark on the disk), then lower the spacer ring over the bolts until it rests on the retaining clips.
- (8) Apply lubricant 'B' to the 24 nuts (03/2-140), then screw the nuts onto the bolts, but do not tighten. Pull the retaining clips off the bolts and remove (Ref.Fig.523). Remove the lifting fixture (Tool 1161) from the disk by releasing the thumbnuts, pushing the claws down, then turn the tommy bars around 180 deg until a ball catch locates in a slot in each leg. Lift the fixture from the disk.

NOTE: It is recommended that on removing the lifting fixture a suitable size disk (of cardboard or another suitable material) is rested on the disk and marked 1 to 24 in numerical sequence, each number in line and representing a bolt. This is only a convenience to aid the torque-tightening sequence which follows in para.(9). Since the bolts themselves are not numbered the sequence can commence on any bolt.

- (9) Using a torque wrench, run the nuts down to 'nip' the spacer ring, then using wrenches (Tool 1557 and 627) and a torque wrench, tighten the nuts in increments of 90 lbf in. (10,2 N.m) to a final torque of between 300 and 330 lbf in. (33,9 and 37,3 N.m) in the following sequence: 1, 13, 7, 19, 4, 16, 10, 22, 2, 14, 8, 20, 5, 17, 11, 23, 3, 15, 9, 21, 6, 18, 12 and 24. Locking (run-down) torque 9.1 lbf in. (1,1 N.m).
- (10) Withdraw the three supports (Tool 1006) through the access apertures in the slave exit guide vane cases. Reassemble the blanking plates to the cases.
- (11) Remove the protector/blank (Tool 1684) from the rotor blades, then using feeler gauges, check the tip clearance between the stage 6 rotor blades and the compressor case. Find the longest and shortest blades, check the max. and min. tip clearance at eight equi-spaced points, then find the average max. and min. tip clearance. Refer to the Fits and Clearances Schedule (72-30-00) FCS 30. Replace the protector/blank (Tool 1684) if the assembly is not to be continued immediately.

B. Assemble the Stage 5 Stator Vanes and Vane Fixing Ring to the LP Compressor Case (Ref.SB.72-19).

NOTE: The labyrinth ring (3-200) will already have been assembled to the vane fixing ring as a unit and will not be referred to as a separate item, the vane fixing ring only will be referenced at each stage of build.

- (1) Remove the protector/blank (Tool 1684) (if assembled) from the stage 6 rotor blades, and the torque-tightening cardboard disk (if used) from the disk.
- (2) Apply lubricant 'A' to the stage 5 stator vane grooves in the case, and to the vane grooves in the stage 5 vane fixing ring (3-190).

MK.610-14-28  
OVERHAUL

- (3) Turn the vane fixing ring (3-190) so that the loading slot cut-away is uppermost, then lower the fixing ring over the spacer ring, positioning the cut-away so that it aligns with the vane loading slot in the case.

NOTE: Although none of the stator vanes are numbered for position, the bolted vanes are identified by the tapped threads in the vane platform, and the probe vanes identified by the cut-away sections in the vane outer (larger) platform. The holes will line up with corresponding holes in the compressor case. For clarification, a diagrammatic layout for each stage of stator vanes has been included in the text showing their exact location when assembled to the LP case.

- (4) Identify the probe and bolted vanes, then separate them from the 59 standard vanes (3-100).
- (5) Check that all stage 5 stator vanes are free from damage, giving particular attention to the leading and trailing edges.

NOTE: Ensure that any repaired vanes are evenly distributed around the case and that the aggregate depth of blending does not exceed 1.800 in. (45,72 mm) (Ref.72-31-01 Repair No.2).

- (6) Assemble the vanes to the case, passing each vane through the loading slot in the vane fixing ring and moving the vanes clockwise or counter-clockwise as necessary to take up their correct position in the case (Ref.Fig.526). During assembly of the vanes, ensure that the loading slot of the vane fixing ring aligns the loading slot of the case (Ref.Fig.525).
- (7) Ensure that the bolted vanes align with the bolt-holes in the case, and that the probe vanes are correctly positioned by inserting the checking gauge (Tool 289) through the outside of the case at the probe vane positions, ensuring that adequate clearance exists between the gauge and the probe vanes.

NOTE: This check is to ensure that inspection probes can be assembled to the case at a later date.

- (6) Torque-tighten all the blanking plug retaining bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m), the support plug assembly (3-50) retaining bolts between 80 and 90 lbf in. (9,0 and 10,2 N.m), and the fixed blade retaining bolts between 80 and 90 lbf in. (9,0 and 10,2 N.m).
- (7) Torque-tighten the nuts securing the retaining piece (3-90) at the vane fixing ring position between 85 and 95 lbf in. (9,6 and 10,7 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).
- (8) Wire-lock all the retaining bolts.
- (9) Using two sets of feeler gauges, check the clearance between the stage 5-6 spacer ring labyrinth and the stage 5 vane fixing ring. Carry out this check by inserting 0.025 in. (0,635 mm) feelers between the labyrinth and ring, then insert the required amount of feelers to measure the remaining clearance between the labyrinth and ring at a point diametrically opposite the first set of feeler gauges. Take the total of the two sets of feelers as the clearance. Carry out the check at three more equi-spaced positions, then take the average of the four readings. The clearance must be within the dimension quoted in the Fits and Clearances Schedule (72-30-00) FCS 36.
- (10) If the assembly is not to be worked on immediately, place the protector/blank (Tool 1683) over the stator vanes.

D. Assemble the Stage 5 Rotor Disk and the Stage 4-5 Spacer Ring.

NOTE: The procedure for building the remaining stages of rotor disks, spacer rings, vane fixing rings and stator vanes is similar throughout the build, so that figures shown earlier in the text may be referred to generally. Specific differences will be covered by the appropriate figure.

SUB-ASSEMBLY

**72-31-00**

Page 557

OVERHAUL

- (1) Lay out 24 bolts (03/2-130) on the worktop, then lubricate the threads of each bolt with lubricant 'B'.
- (2) Insert a bolt (03/2-130) into the datum hole of the front (upper) flange of the stage 5-6 spacer ring (03/2-150) so that it extends upwards, then screw an assembly pin (Tool 1065) into the bolt. Insert the remainder of the bolts and screw assembly pins onto the bolts. Ensure the pins are upright and mark the top of the datum hole pin so that it is readily identified. The procedure is similar to that shown in Fig.506.
- (3) Assemble the lifting fixture (Tool 1161) (Ref.Fig.519) to the front face of the stage 5 rotor disk (03/2-120), identified by the blade keys. Insert the claws through the centre hole, then turn the three tommy bars around 180 deg. until a ball catch locates in the slot in each leg. Screw down on the three thumb-nuts to lock the claws.
- (4) Remove the protector/blank (Tool 1683) from the stator vanes (if assembled), then clean the stator vanes and disk of any chalk marks and remove the numbered (card-board) disk (if assembled) from the stage 6 rotor disk. Remove the protection band (Tool 1127) from the stage 5 rotor blades.
- (5) Attach a hoist to the lifting fixture, then raise and position the rotor disk over the compressor case. Insert an alignment rod (Tool 380) into the datum position assembly pin (Tool 1065), then align the datum position of the stage 6 rotor disk with the rod (Ref.Fig.519). Lower the rotor disk until the rod passes through the disk datum hole and protrudes a few inches through the disk. Centralize the rotor disk with the case, then insert rods through the 23 vacant holes in the rotor disk to locate in the assembly pins assembled to the bolts below (Ref.Fig.520). Carefully lower the rotor disk guiding it over the assembly pins to abut the spacer ring (Ref.Fig.521). Remove the alignment rods and place them in a container. Remove the hoist, leaving the lifting fixture assembled to act as a blank. Place the protector/blank (Tool 1683) on top of the rotor blades.

OVERHAUL

- (6) Turning the assembly pins as required to align the flat on the bolthead with the wall of the spacer ring, pull up on the pins until all the thread and a waisted portion of the bolts are visible, then clip retaining clips (Tool 1038) onto the waisted portions of the bolts, with the clips extending towards the centre of the disk (Ref.Fig.522). Indicate the rotor datum hole by a chalk mark on the disk, then remove the assembly pins from the bolts. If any of the bolts are too tight to pull up with the assembly pins, screw the mechanical driver (Tool 1064) (Ref.Fig.522) onto a pin, then insert the locating key (Tool 1066) into the assembly pin locating the key into the slot in the bolt. Lock the locating key by screwing the thumbnut onto the assembly pin, then turn the locating key handle until it points towards the centre of the rotor. This aligns the flat on the bolthead with the spacer ring. Screw down on the driver tommy bars and draw the bolt up until it abuts the spacer ring front flange. Release and remove the locating key, mechanical driver, then clip a retaining clip (Tool 1038) onto the waisted portion of the bolt. Remove the assembly pin.
- (7) Release and remove the protector (Tool 1169) from the stage 4-5 spacer ring (03/2-90), then turn the spacer ring so that the labyrinth on its circumference is nearer to the disk. Establish the datum hole in the bottom flange, align the datum holes of the spacer ring and disk (by a chalk mark on the disk), then offer the spacer ring over the rotor bolts until it rests on the retaining clips.
- (8) Apply lubricant 'B' to the nuts (03/2-80), then screw the nuts onto the rotor bolts, but do not tighten. Pull the retaining clips off the bolts and remove.
- (9) Remove the lifting fixture (Tool 1161) from the rotor by releasing the thumbnuts, pushing the claws down, then turning the tommy bars around 180 deg until a ball catch locates in a slot in each leg. Lift the fixture away.

- (10) Using the wrenches (Tool 1557 and 627) and a torque wrench, tighten the nuts in increments of 90 lbf in. to a final torque between 300 and 330 lbf in. (33,9 and 37,3 N.m) in the following sequence - 1, 13, 7, 19, 4, 16, 10, 22, 2, 14, 8, 20, 5, 17, 11, 23, 3, 15, 9, 21, 6, 18, 12 and 24. Locking (run-down) torque 9.5 lbf in. (1,1 N.m).
- (11) After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 1.5 thread pitches beyond nut chamfer, the bolt must be renewed (Ref.SB.72-8449-191).
- (12) Remove the protector/blank (Tool 1683) from the rotor blades, then using feeler gauges, check the tip clearance between the stage 5 rotor blades and the compressor case. Find the longest and shortest blades and check the max. and min. tip clearance at eight equi-spaced points then find the average max. and min. tip clearance. Refer to the Fits and Clearances Schedule (72-30-00) FCS 29. Replace the protector/blank if the assembly is not to be continued immediately.

E. Assemble the Stage 4 Stator Vanes to the LP Compressor Case (Ref.Fig.527).

NOTE: Before commencing assembly refer to SB.72-19 and SB.72-54.

- (1) Remove the protector/blank (Tool 1683) (if assembled) from the stage 5 rotor blades.
- (2) Apply lubricant 'A' to the stage 4 stator vane grooves in the case and to the vane grooves in the stage 4 vane fixing ring (2-390).
- (3) Turn the vane fixing ring (2-390) so that the two loading slot bolts extend upwards, then lower the fixing ring over the spacer ring, positioning the loading slot to align with the vane loading slot in the case.
- (4) Identify the probe and bolted vanes, then separate them from the standard vanes.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (5) Check that all stage 4 stator vanes are free from damage giving particular attention to the leading and trailing edges.

NOTE: Ensure that any repaired vanes are evenly distributed around the case and that the aggregate depth of blending does not exceed 1.800 in. (45,72 mm) (Ref.72-31-01 Repair No.2).

- (6) Assemble the vanes to the case (Ref.Fig.526), passing each vane through the loading slot in the vane fixing ring and moving the vanes clockwise or counter-clockwise as necessary allowing the vanes to take up their correct position in the case. During the assembly of the vanes ensure that the loading slot of the vane fixing ring aligns the loading slot of the case (Ref.Fig.525).
- (7) Ensure that the bolted vanes align with the bolt-holes in the case, and that the probe vanes are correctly positioned by inserting the checking gauge (Tool 289) through the outside of the case at the probe vane positions, ensuring that adequate clearance exists between the gauge and the probe vanes.

NOTE: This check is to ensure that inspection probes can be assembled to the case at a later date.

- (8) Assemble a retaining piece (2-290) over the two bolts retained in the vane fixing ring, then apply lubricant 'B' to the bolt threads and assemble two nuts (2-280) to the bolts. Do not tighten nuts at this stage.

F. Assemble the Stage 4 Support Plug Assemblies and the Stator Vane Retaining Bolts (Ref.Fig.527).

- (1) Assemble two sleeves (2-220) to two bolts (2-210), apply lubricant 'B' to the bolt threads, then insert the bolts into the case at the loading slot position (Ref.Fig.527) and screw them into the blade platform.
- (2) Adopting the same procedure, and using lubricant 'B' on the bolts, assemble sleeves (2-220) to the four bolts (2-210), then assemble them to the remaining two positions.

SUB-ASSEMBLY

72-31-00

Page 562

Nov 1/76

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (3) Apply lubricant 'B' to two bolts (2-260), then assemble a support plug assembly (2-250) to the case (Ref.Fig.527) and secure it to the case with the two bolts. Assemble two plugs (2-240) to the support plug assembly and retain the plugs with two bolts (2-230) lubricated with lubricant 'B'. Assemble two sleeves (2-220) to two bolts (2-210), apply lubricant 'B' to the threads of the two bolts, then assemble the sleeves and bolts to the two positions immediately to the rear of the support plug assembly.
- (4) Commencing at the loading slot position torque-tighten the two nuts (2-280) at the vane fixing ring position between 85 and 95 lbf in. (9,6 and 10,7 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m). Torque-tighten the two bolts at the outer platform (outside the case) between 80 and 90 lbf in. (9,0 and 10,2 N.m), then wire-lock these bolts together.
- (5) Torque-tighten the remaining sleeved bolts between 80 and 90 lbf in. (9,0 and 10,2 N.m), then wire-lock each pair of bolts together.
- (6) Torque-tighten the two bolts retaining the support plug assembly to the case between 80 and 90 lbf in. (9,0 and 10,2 N.m), then wire-lock the two bolts together. Torque-tighten the two bolts retaining the two plugs to the support plug assembly between 85 and 95 lbf in. (9,6 and 10,7 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m). Torque-tighten the two bolts (with the sleeves) between 80 and 90 lbf in. (9,0 and 10,2 N.m), then wire-lock the two bolts together.
- (7) Using two sets of feeler gauges, check the clearance between the stage 4-5 spacer ring labyrinth and the stage 4 vane fixing ring. Carry out this check by inserting 0.025 in. (0,635 mm) feelers between the labyrinth and ring, then insert the required amount of feelers to measure the remaining clearance between the labyrinth and ring at a point diametrically opposite the first set of feeler gauges. Take the total of the two sets of feelers as the clearance. Carry out the check at three more equi-spaced positions,

SUB-ASSEMBLY

72-31-00

Page 563

OLYMPUS 593

MK.610-14-28  
OVERHAUL

then take the average of the four readings. The clearance must be within the dimension quoted in the Fits and Clearances Schedule (72-30-00) FCS 32.

- (8) If the assembly is not to be continued immediately place the protector/blank (Tool 1683) over the stator vanes.

G. Assemble the Stage 4 Rotor Disk and the Stage 3-4 Spacer Ring.

- (1) Lay out 24 bolts (03/2-70) on a clean worktop, then apply lubricant 'B' to the threads of each bolt.
- (2) Insert a bolt (03/2-70) into the upper (front) flange of the stage 4-5 spacer ring (03/2-90) so that it extends upwards, then screw an assembly pin (Tool 1065) onto the bolt (Ref.Fig.506). Insert the remainder of the bolts and screw assembly pins onto the bolts. Ensure the pins are upright. Mark the top of the datum hole pin so that it is readily identified.
- (3) Assemble the lifting fixture (Tool 1161) (Ref.Fig.519) to the front face of the stage 4 rotor disk (03/2-60) identified by the locking tangs. Guide the three claws of the fixture through the centre hole of the disk, then turn the claws outward to lock and locate on the rear face of the disk. Screw down the three thumbnuts to secure the claws in the locked position. Mark the datum position on the front face of the rotor disk with suitable chalk.
- (4) Remove the protection/retaining band (Tool 1126) from the tips of the rotor blades and, if assembled, the protector/blank (Tool 1683) from the stator vanes. Attach the overhead hoist to the lifting fixture, then raise the hoist and position the rotor disk over the case. Mark the datum hole position on the front face of the disk with suitable chalk.

SUB-ASSEMBLY

**72-31-00**

Page 564

Jul 1/76

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (5) Insert an alignment rod (Tool 380) into the datum position assembly pin (Tool 1065), then align the datum position of the stage 4 rotor disk with the rod. Lower the stage 4 rotor disk until the rod passes through the disk datum hole and protrudes a few inches. Centralize the rotor disk with the case, then insert rods through the remaining 23 bolt-holes in the rotor disk to locate in the assembly pins assembled to the bolts below. Carefully lower the disk guiding it over the assembly pins until it abuts the spacer ring. Withdraw the alignment rods from the assembly pins and place the rods in a container. Place a protector/blank (Tool 1682) over the blades of the rotor. Remove the hoist leaving the lifting fixture assembled to act as a blank.
- (6) Turning the assembly pins as required to align the flat on the bolthead with the wall of the spacer ring, pull up on the pins until all the thread and a waisted portion of the bolts are visible, then clip the retaining clips (Tool 1038) onto the waisted portions of the bolts, with the clips extending towards the centre of the disk (Ref.Fig.522). Remove the assembly pins from the bolts. If any of the bolts are too tight to pull up with the assembly pins, screw the mechanical puller (Tool 1064) (Ref.Fig.522) onto a pin, then insert the locating key (Tool 1066) into the assembly pin locating the key into the slot in the bolt. Lock the locating key by screwing the thumbnut onto the assembly pin, then turn the locating key handle until it points towards the centre of the rotor. This aligns the flat on the bolthead with the spacer ring. Screw down on the puller tommy bars and draw the bolt up until it abuts the spacer ring front flange. Release and remove the locating key and mechanical puller, then clip a retaining clip (Tool 1038) to the waisted portion of the bolt. Remove the assembly pin.

SUB-ASSEMBLY

- (7) Remove the protector (Tool 1168) from the stage 3-4 spacer ring labyrinth (03/2-30), then turn the spacer ring so that the labyrinth on its circumference is nearer the bottom, with the taper on the spacer uppermost. Establish the datum hole in the bottom flange, then align the datum holes of the spacer ring and disk (by the chalk mark on the disk), and offer the spacer over the rotor bolts until it rests on the retaining clips.
- (8) Screw 24 nuts (03/2-20) onto the rotor bolts, but do not tighten. Pull the retaining clips off the bolts and remove.
- (9) Remove the lifting fixture (Tool 1161) from the rotor by releasing the thumbnuts, pushing the claws down, then turning the tommy bars around 180 deg until a ball catch locates in a slot in each leg. Lift the fixture away.
- (10) Using wrenches (Tool 1557 and Tool 627) and a torque wrench, tighten the nuts in the following sequence - 1, 13, 7, 19, 4, 16, 10, 22, 2, 14, 8, 20, 5, 17, 11, 23, 3, 15, 9, 21, 6, 18, 12 and 24. Torque-tighten the nuts in increments of 100 lbf in. (11,3 N.m) to a final torque of between 300 and 330 lbf in. (33,9 and 37,3 N.m). Locking (run-down) torque 9.5 lbf in. (1,1 N.m).
- (11) After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 1.5 thread pitches beyond nut chamfer, the bolt must be renewed (Ref.SB.72-8449-191).
- (12) Remove the protector/blank (Tool 1682) from the rotor blades, then using feeler gauges, check the tip clearance between the stage 4 rotor blades and the compressor case. Find the longest and shortest blades then check the max. and min. tip clearance at eight equi-spaced points, then find the average tip clearance. Refer to the Fits and Clearances Schedule (72-30-00) FCS 28. Replace if the assembly is not to be continued immediately.

H. Assemble the Stage 3 Stator Vanes to the LP Compressor Case (Ref.Fig.528).

NOTE: Before commencing assembly refer to SB.72-19.

- (1) Remove the protector/blank (Tool 1682) (if assembled) from the stage 4 rotor blades.
- (2) Apply lubricant 'A' to the stage 3 stator vane grooves in the case, and to the vane grooves in the stage 3 vane fixing ring unit (2-190).
- (3) Turn the vane fixing ring (2-190) so that the two loading slot bolts extend upwards, then lower the fixing ring over the spacer ring, positioning the loading slot to align with the vane loading slot in the case.
- (4) Identify the probe and bolted vanes, then separate them from the 49 standard vanes.
- (5) Check that all stage 3 stator vanes are free from damage, paying particular attention to the leading and trailing edges.

NOTE: Ensure that any repaired vanes are evenly distributed around the case and that the aggregate depth of blending does not exceed 1.500 in. (38,10 mm) (Ref.72-31-01 Repair No.2).

- (6) Assemble the vanes to the case (Ref.Fig.528), passing each vane through the loading slot in the vane fixing ring and moving the vanes clockwise or counter-clockwise as necessary allowing the vanes to take up their correct position in the case. During the assembly of the vanes ensure that the loading slot of the vane fixing ring aligns the loading slot of the case (Ref.Fig.525).
- (7) Ensure that the bolted vanes align with the bolt-holes in the case, and that the probe vanes are correctly positioned by inserting the checking gauge (Tool 289) through the outside of the case at the probe vane positions ensuring that adequate clearance exists between the gauge and the probe vanes.

NOTE: This check is to ensure that inspection probes can be assembled to the case at a later date.

OVERHAUL

- (8) Assemble a retaining piece (2-90) over the two bolts retained in the vane fixing ring, then apply lubricant 'B' to the bolt threads and assemble two nuts (2-80) to the bolts. Do not tighten nuts at this stage.

J. Assemble the Stage 3 Support Plug Assemblies and the Stator Vane Retaining Bolts (Ref.Fig.528).

- (1) Commencing at the loading slot position assemble two sleeves (2-20) to two bolts (2-10), apply lubricant 'B' to the bolt threads, then assemble the bolts and sleeves to the case to retain the bolted vane. Assemble a retaining piece (2-90) to the two bolts protruding through the bolted vane platform inner end, then lubricate two nuts (2-80) with lubricant 'B'. Screw the nuts onto the bolts to secure the retaining plate.
- (2) Assemble two sleeves (2-20) to two bolts (2-10), apply lubricant 'B' to their threads, then assemble the bolts to the case (Ref.Fig.528).
- (3) Assemble a support plug assembly (2-50) to the case, then secure the assembly with two bolts (2-60) lubricated with lubricant 'B'. Assemble two plugs (2-40) to the support plug assembly, then secure the plugs with two bolts (2-30) lubricated with lubricant 'B'. Assemble two sleeves (2-20) to two bolts (2-10), lubricate the bolt threads with lubricant 'B', then assemble the bolts to the case immediately to the rear of the plug assemblies.
- (4) Secure the mounting bracket (4-70), already assembled to the front blow-off flange, with two sleeves (2-20) and two bolts (2-10) lubricated with lubricant 'B'. Torque-tighten the bolts between 80 and 90 lbf in. (9,0 and 10,2 N.m). Wire-lock each bolt (2-10) to the bracket (4-70).

SUB-ASSEMBLY

72-31-00

Page 569

OVERHAUL

- (5) Commencing at the loading slot position, torque-tighten the two nuts (2-80) at the inner fixing ring/stator vane position (Ref.Fig.528) between 85 and 95 lbf in. (9,6 and 10,7 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m). Torque-tighten the two bolts at the outer platform (outside the case) between 80 and 90 lbf in. (9,0 and 10,2 N.m), then wire-lock these bolts together.
- (6) Torque-tighten the sleeved bolts (Ref.Fig.528) between 80 and 90 lbf in. (9,0 and 10,2 N.m), then wire-lock each pair of bolts together.
- (7) Torque-tighten the two bolts retaining the support plug assembly to the case (Ref.Fig.528) between 80 and 90 lbf in. (9,0 and 10,2 N.m), then wire-lock the two bolts together. Torque-tighten the two bolts retaining the two plugs to the support plug assembly between 85 and 95 lbf in. (9,0 and 10,2 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m). Torque-tighten the two bolts (with the sleeves) between 80 and 90 lbf in. (9,0 and 10,2 N.m), then wire-lock the two bolts together.
- (8) Using two sets of feeler gauges, check the clearance between the stage 3-4 spacer ring labyrinth and the stage 3 vane fixing ring. Carry out this check by inserting 0.030 in. (0,762 mm) feelers between the labyrinth and ring, then insert the required amount of feelers to measure the remaining clearance between the labyrinth and ring at a point diametrically opposite the first set of feeler gauges. Take the total of the two sets of feelers as the clearance. Carry out this check at three more equi-spaced positions, then take the average of the four readings. The clearance must be within the dimension quoted in the Fits and Clearances Schedule (72-30-00) FCS 21.
- (9) If the assembly is not to be continued immediately assemble a protector/blank (Tool 1682) to the stator vanes.

OVERHAUL

K. Assemble the Stage 3 Rotor Disk and the Stage 2-3 Spacer Ring.

- (1) Lay out 24 bolts (03/2-10) on a clean worktop, then apply lubricant 'B' to the threads of each bolt.
- (2) Insert a bolt (03/2-10) into the datum hole of the upper (front) flange of the stage 3-4 spacer ring so that it extends upwards, then screw an assembly pin (Tool 1065) onto the bolt (Ref.Fig.506). Insert the remainder of the bolts and screw assembly pins onto the bolts. Ensure the pins are upright, mark the top of the datum hole pin so that it is readily identified.
- (3) Assemble the lifting fixture (Tool 1161) (Ref.Fig.519) to the front face of the stage 3 rotor disk (03/1-360), identified by the locking tangs. Guide the three claws through the centre hole, then turn the claws outward to lock and locate on the rear face of the disk. Screw down the three thumbnuts to secure the claws in the locked position.
- (4) Remove the protection/retaining band (Tool 1125) from the tips of the rotor blades and, if assembled, the protector/blank (Tool 1682) from the stator vanes. Attach the overhead hoist to the lifting fixture, then raise the hoist and position the rotor disk over the compressor case. Mark the datum hole position on the front face of the disk with suitable chalk.
- (5) Insert an alignment rod (Tool 380) into the datum position assembly pin (Tool 1065), then align the datum position of the stage 3 rotor disk with the rod. Lower the stage 3 rotor disk until the rod passes through its datum hole and protrudes a few inches. Centralize the rotor disk with the case, then insert rods through the remaining 23 bolt-holes in the rotor disk to locate in the assembly pins assembled to the bolts below (Ref.Fig.520). Carefully lower the disk guiding it over the assembly pins until it abuts the spacer ring (Ref.Fig.521). Withdraw the alignment

PRINTED IN ENGLAND

MK.610-14-28  
OVERHAUL

rods (Tool 380) from the assembly pins and place the pins in a container. Place a protector/blank (Tool 1681) over the blades of the rotor. Remove the hoist leaving the lifting fixture assembled to act as a blank.

- (6) Turning the assembly pins as required to align the flat on the bolthead with the wall of the spacer ring, pull up on the pins until all the thread and a waisted portion of the bolts are visible, then clip retaining clips (Tool 1038) onto the waisted portions of the bolts with the clips extending towards the centre of the disk (Ref.Fig.522). Indicate the rotor datum hole by a chalk mark on the disk, then remove the assembly pins from the bolts. If any of the bolts are too tight to pull up with the assembly pins, screw the mechanical driver (Tool 1064) (Ref.Fig.522) onto a pin, then insert the locating key (Tool 1066) into the assembly pin locating the key to the side of the step in the bolthead with the step face on the bolt facing the case. Lock the locating key by screwing the thumb-nut onto the assembly pin, then turn the locating key handle until it points towards the centre of the rotor, this aligns the flat on the bolthead with the spacer ring. Screw down on the mechanical puller tommy bars and draw the bolt up until it abuts the spacer ring front flange. Release and remove the locating key and mechanical puller, then clip a retaining clip (Tool 1038) onto the waisted portion of the bolt and remove the assembly pins. Repeat this procedure on any bolts that are tight.
- (7) Remove the protector (Tool 443) from the stage 2-3 spacer ring (03/1-280), then turn the spacer ring so that the taper on the spacer ring is uppermost. Establish the datum hole in the bottom flange, align the datum holes of the spacer ring and disk (by the chalk mark on the disk), then lower the spacer ring over the rotor bolts until it rests on the retaining clips.
- (8) Screw 24 nuts (03/1-270) onto the rotor bolts, but do not tighten. Pull the retaining clips off the bolts and place them in a container.

- (9) Remove the lifting fixture (Tool 1161) from the rotor by releasing the thumbnuts, pushing the claws down, then turning the tommy bars around 180 deg until a ball catch locates in a slot in each leg. Lift the fixture away.
  - (10) Using wrenches (Tool 1557 and Tool 1591) and a torque wrench, tighten the nuts in the following sequence - 1, 13, 7, 19, 4, 16, 10, 22, 2, 14, 8, 20, 5, 17, 11, 23, 3, 15, 9, 21, 6, 18, 12 and 24. Torque-tighten the bolts in increments of 100 lbf in. (11,3 N.m) to a final torque of between 300 and 330 lbf in. (33,9 and 37,3 N.m). Locking (run-down) torque 9.5 lbf in. (1,1 N.m).
  - (11) After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 1.5 thread pitches beyond nut chamfer, the bolt must be renewed (Ref.SB.72-8449-191).
  - (12) Remove the protector/blank (Tool 1681) from the rotor blades, then using feeler gauges, check the tip clearance between the stage 3 rotor blades and the compressor case. Find the longest and shortest blades and check the max. and min. tip clearance at eight equi-spaced points, then find the average max. and min. tip clearance. Refer to the Fits and Clearances Schedule (72-30-00) FCS 27. Replace the protector/blank (Tool 1681) if the assembly is not to be continued immediately.
- L. Assemble the Stage 2 Stator Vanes to the LP Compressor Case (Ref.Fig.529).

NOTE: Before commencing assembly refer to SB.72-19.

- (1) Remove the protector/blank (Tool 1681) (if assembled) from the stage 3 rotor blades.
- (2) Apply lubricant 'A' to the second stage stator vane grooves in the case, and to the vane grooves in the stage 2 vane fixing ring unit (1-370).

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (3) Turn the vane fixing ring (1-370) so that the two loading slot bolts extend upwards, then lower the fixing ring over the spacer ring, positioning the loading slot to align the vane loading slot in the case.
- (4) Identify the probe and bolted vanes, then separate them from the 38 standard vanes.
- (5) Check that all stage 2 stator vanes are free from damage, paying particular attention to the leading and trailing edges.

NOTE: Ensure that any repaired vanes are evenly distributed around the case and that the aggregate depth of blending does not exceed 2.000 in. (50,80 mm) (Ref.72-31-01 Repair No.2).

- (6) Assemble the vanes to the case (Ref.Fig.529), passing each vane through the loading slot in the vane fixing ring, moving the vanes clockwise or counter-clockwise as necessary allowing the vanes to take up their correct position in the case. During the assembly of the vanes ensure that the loading slot of the vane fixing ring aligns the loading slot of the case (Ref.Fig.525).
- (7) Ensure that all the bolted vanes align with their respective holes in the case. Insert the checking gauge (Tool 289) through the outside of the case at the probe vane position ensuring that adequate clearance exists between the gauge and probe vanes.

NOTE: This check is to ensure that inspection probes can be assembled to the case at a later date.

- (8) Assemble a retaining piece (1-280) over the two bolts retained in the vane fixing ring, then apply lubricant 'B' to their threads and assemble two nuts (1-270) to the bolts. Do not tighten nuts at this stage.

OVERHAUL

M. Assemble the Stage 2 Support Plug Assembly and the Stator Vane Retaining Bolts (Ref.Fig.529).

- (1) Assemble a support plug assembly (1-240) to the case and secure it with two bolts (1-250) lubricated with lubricant 'B'. Assemble two blanking plugs (1-230) to the support plug assembly, then retain the plugs with two bolts (1-220) lubricated with lubricant 'B'. Assemble four sleeves (1-210) to four bolts (1-200), apply lubricant 'B' to the bolt threads, then secure the bolted vane and probe vane with the bolts.
- (2) Torque-tighten the nuts securing the retaining piece (1-280) to the bolted vane and inner fixing ring between 170 and 190 lbf in. (19,2 and 21,5 N.m). Locking (run-down) torque 6.5 lbf in. (0,73 N.m).
- (3) Torque-tighten the two bolts retaining the blanking plugs to the support plug assembly between 85 and 95 lbf in. (9,6 and 10,7 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).
- (4) Torque-tighten the four sleeved bolts (1-200) between 160 and 180 lbf in. (18,1 and 20,3 N.m), then wire-lock these bolts in pairs. Torque-tighten the two bolts (1-250) between 160 and 180 lbf in. (18,1 and 20,3 N.m), wire-lock the two bolts together.
- (5) Using two sets of feeler gauges, check the clearance between the stage 2-3 spacer ring labyrinth and the stage 2 vane fixing ring. Carry out this check by inserting 0.025 in. (0,635 mm) feelers between the labyrinth and ring, then insert the required amount of feelers to measure the remaining clearance between the labyrinth and ring at a point diametrically opposite the first set of feeler gauges. Take the total of the two sets of feelers as the clearance. Carry out the check at three more equi-spaced positions, then take the average of the four readings. The clearance must be within the dimension quoted in the Fits and Clearances Schedule (72-30-00) FCS 17.

OVERHAUL

- (6) If the assembly is not to be continued immediately, assemble a protector/blank (Tool 1681) to the stator vanes.

N. Assemble the Stage 2 Rotor Disk and the Stage 1-2 Spacer Ring.

- (1) Lay out 20 bolts (03/1-260) on a suitable worktop, lubricate the threads of each bolt with lubricant 'B'.
- (2) Insert a bolt (1-260) into the datum hole of the upper (front) flange of the stage 2-3 spacer ring so that it extends upwards, then screw an assembly pin (Tool 1067) onto the bolt ensuring the step face on the bolt end faces the spacer wall. Insert the remainder of the bolts and screw assembly pins onto the bolts. Ensure the pins are upright, and mark the top of datum hole pin so that it is readily identified.
- (3) Ensure that a retaining band (Tool 1166) is assembled to each pair of blades of the stage 2 rotor disk (03/1-250), and that the bands are towards the tip of the blades with the band fasteners uppermost. The blade tangs are to the rear of the disk.
- (4) Assemble the multiple leg sling (Tool 1102), to the rotor blades (Ref.Fig.531).
  - (a) Attach a hoist to the sling lifting ring, then position the hoist over the rotor disk.
  - (b) Ensure that the tommy bars of the legs are pointed to 'FREE', then lower the hoist guiding the legs in between the rotor blades. When the three pads of the equipment rest on the blade roots, turn the tommy bars to 'LIFT'.
- (5) Remove the protector/blank (Tool 1681) (if assembled) from the stator vanes, then clean the stator vanes and disk of any chalk marks. Remove the padding ring (Tool 1108) from the compressor case front (top) flange, then remove the protective band (Tool 1124) from the stage 2 rotor blades.

Page 577

Jul 1/76

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (6) Raise the hoist/rotor and position it over the compressor case. Establish the datum hole of the rotor and align it with the marked assembly pin, then steadily lower the rotor taking care it does not swing causing damage to the blades or case. When the rotor is just touching the assembly pins, stop lowering the rotor and ensure that all the pins are aligned with, and entering into the rotor securing holes, and that the marked pin is aligned with the rotor datum hole. Steadily lower the rotor ensuring all the pins are located in the rotor. When the rotor abuts the spacer, turn the tommy bars of the sling to 'FREE', then raise the hoist, guiding the legs out from between the blades. Remove the sling from the hoist. Remove the retaining bands (Tool 1166) from the rotor blades.
- (7) Place a protector/blank (Tool 1680) on top of the rotor blades, and a convenient size disk over the centre hole in the rotor disk. Reassemble the padding ring (Tool 1108) to the front (top) flange of the case locating the ring's tapped pins in the flange bolt-holes.
- (8) Turning the assembly pins as required to align the flat on the bolthead with the wall of the spacer ring, pull up on the pins until all the thread and a waisted portion of the bolts are visible, then clip retaining clips (Tool 1038) onto the waisted portions of the bolts, with the clips extending towards the centre of the disk (Ref.Fig.522). Remove the assembly pins from the bolts. If any of the bolts are too tight to pull up with the assembly pins, screw the mechanical puller (Tool 1064) (Ref.Fig.522) onto a pin, then insert the locating key (Tool 987) into the assembly pin locating the key to the side of the step in the bolthead with the step face on the bolt facing the case. Lock the locating key by screwing the thumbnut onto the assembly pin, then turn the locating key handle until it points towards the centre of the rotor, this aligns the flat on the bolthead with the case. Screw down on the puller tommy bars and draw the bolt up until it abuts the spacer ring

OVERHAUL

front flange. Release and remove the locating key and mechanical puller, then clip a retaining clip (Tool 1038) to the waisted portion of the bolt. Repeat this procedure on any bolts that are tight. Remove the assembly pins.

- (9) Release and remove the protector (Tool 443) from the stage 1-2 spacer ring (03/1-190), then turn the spacer ring so that the smaller diameter is uppermost. Establish the datum hole in the bottom flange, align the datum holes of the disk and spacer ring, then lower the spacer ring over the rotor bolts until it rests on the retaining clips.
- (10) Apply lubricant 'B' to the nut threads, then screw the nuts onto the rotor bolts, but do not tighten. Pull the retaining clips off the bolts and remove.
- (11) Using wrench (Tool 1627) and a torque wrench, tighten the nuts in the following sequence - 1, 11, 7, 17, 4, 14, 9, 19, 3, 13, 6, 16, 10, 20, 5, 15, 2, 12, 8, and 18, in increments of 13 lbf ft (16,2 N.m), to a final torque of between 38 and 42 lbf ft (51,5 and 56,9 N.m). Locking (run-down) torque 14 lbf in. (1,6 N.m).
- (12) Remove the protector/blank (Tool 1680) from the rotor blades, then using feeler gauges, check the tip clearance between the stage 2 rotor blades and the compressor case. Find the longest and shortest blades and check the max. and min. tip clearance at eight equi-spaced points, then find the average max. and min. tip clearance. Refer to the Fits and Clearances Schedule (72-30-00) FCS 26. Replace the protector/blank (Tool 1680) if the assembly is not to be worked on immediately.

P. Assemble the Stage 1 Stator Vanes to the LP Compressor Case (Ref.Fig.529).

NOTE: Before commencing work refer to SB.72-19.

SUB-ASSEMBLY

72-31-00

Page 579

May 1/79

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (1) Remove the protector/blank (Tool 1680) (if assembled) from the stage 2 rotor blades.
- (2) Apply lubricant 'A' to the stage 1 stator vane grooves in the case, and to the vane grooves in the stage 1 vane fixing ring unit (1-180).
- (3) Turn the vane fixing ring (1-180) so that the two loading slot bolts extend upwards, then assemble the fixing ring over the spacer ring, positioning the loading slot to align the vane loading slot in the case.
- (4) Identify the probe and bolted vanes, then separate them from the 38 standard vanes.
- (5) Check that all stage 1 stator vanes are free from damage, paying particular attention to the leading and trailing edges.

NOTE: Ensure that any repaired vanes are evenly distributed around the case and that the aggregate depth of blending does not exceed 2.000 in. (50,80 mm) (Ref.72-31-01 Repair No.2).

- (6) Assemble the vanes to the case (Ref.Fig.529) passing each vane through the loading slot in the vane fixing ring, moving the vanes clockwise or counter-clockwise as necessary allowing the vanes to take up their correct position in the case. During the assembly of the vanes ensure that the loading slot of the vane fixing ring aligns the loading slot of the case.
- (7) Ensure that the bolted vanes align with the bolt-holes in the case, and that the probe vanes are correctly positioned by inserting the checking gauge (Tool 289) through the outside of the case at the probe vane position ensuring that adequate clearance exists between the gauge and the probe vanes.

NOTE: This check is to ensure that inspection probes can be assembled to the case at a later date.

- (8) Assemble a retaining piece (1-90) over the two bolts retained in the fixing ring, apply lubricant 'B' to the bolt threads and assemble two nuts (1-80) to the bolts. Do not tighten nuts at this stage.

MK.610-14-28  
OVERHAUL

Q. Assemble the Stage 1 Support Plug Assembly and the Stator Vane Retaining Bolts (Ref.Fig.529).

- (1) Assemble a support plug assembly (1-50) to the probe position in the stage 1 location. Retain the assembly with two bolts (1-60) lubricated with lubricant 'B'. Assemble two blanking plugs (1-40) to the support plug assembly, then retain the two plugs with two bolts (1-30) lubricated with lubricant 'B' (Ref. Fig.529). Assemble four sleeves (1-20) to four bolts (1-10) apply lubricant 'B' to the bolt threads then secure the bolted vane and probe vane with the bolts.
- (2) Torque-tighten the nuts securing the retaining piece (1-90) to the bolted vane and inner fixing ring between 170 and 190 lbf in. (19,2 and 21,5 N.m). Locking (run-down) torque 6.5 lbf in. (0,73 N.m).
- (3) Torque-tighten the two bolts (1-30) retaining the blanking plugs to the support plug assembly between 85 and 95 lbf in. (9,6 and 10,7 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).
- (4) Torque-tighten the four sleeved bolts (1-10) between 160 and 180 lbf in. (18,1 and 20,3 N.m), then wire-lock the bolts in pairs. Torque-tighten the two bolts (1-60) between 160 and 180 lbf in. (18,1 and 20,3 N.m), wire-lock the two bolts together.
- (5) Using two sets of feeler gauges, check the clearance between the stage 1-2 spacer ring labyrinth and the stage 1 vane fixing ring. Carry out this check by inserting 0.025 in. (0,635 mm) feelers between the labyrinth and ring, then insert the required amount of feelers to measure the remaining clearance between the labyrinth and ring at a point diametrically opposite the first set of feeler gauges. Take the total of the two sets of feelers as the clearance. Carry out the check at three more equi-spaced positions, then take the average of the four readings. The clearance must be within the dimension quoted in the Fits and Clearances Schedule (72-30-00) FCS 13.

OVERHAUL

- (6) If the assembly is not to be continued immediately, place a protector/blank (Tool 1680) over the stage 1 stator vanes.

R. Assemble the Stage 1 Rotor Disk.

- (1) Lay out 14 bolts (03/1-170) on a suitable worktop, then lubricate the threads of each bolt with lubricant 'B'.
- (2) Insert a bolt (03/1-170) into the datum hole of the upper (front) flange of the first stage spacer ring (03/1-190) so that it extends upwards, then screw an assembly pin (Tool 1067) onto the bolt (Ref.Fig.530). Insert the remainder of the bolts and screw assembly pins onto the bolts ensuring the step face on each bolt faces the wall of the spacer ring. Ensure the pins are upright, then mark the top of datum hole pin so that it is readily identified.
- (3) Ensure that a retaining band (Tool 1166) is assembled to each pair of blades of the stage 1 rotor disk (03/1-160), and that the bands are towards the tips of the blades with the band fasteners uppermost. The blade locking tangs are to the rear of the disk.
- (4) Assemble the multiple leg sling (Tool 1103) to the rotor blades (Ref.Fig.531).
  - (a) Attach a hoist to the sling lifting ring, then position the hoist over the rotor disk.
  - (b) Ensure that the tommy bars of the legs are pointed to 'FREE', then lower the hoist guiding the legs in between the rotor blades. When the three pads of the sling rest on the blade roots, turn the tommy bars to 'LIFT'.

- (5) Remove the protector/blank (Tool 1680) (if assembled) from the stator vanes, then clean the stator vanes and disk of any chalk marks and remove the numbered (cardboard) disk (if assembled) from the second stage rotor disk. Remove the padding ring (Tool 1108) from the compressor case front flange, then remove the protection/retaining band (Tool 1123) from the blades of the stage 1 rotor.
- (6) Raise the hoist/rotor and position it over the compressor case (Ref.Fig.532). Establish the datum hole of the rotor and align it with the marked assembly pin, then steadily lower the rotor taking care it does not swing causing damage to the blades or case. When the rotor is just touching the assembly pins, stop lowering the rotor and ensure that all the pins are aligned with, and entering into the rotor securing holes, and that the marked pin is aligned with the rotor datum hole. Steadily lower the rotor ensuring all the pins are located in the rotor. When the rotor abuts the spacer ring, turn the tommy bars of the sling to 'FREE', then raise the hoist, guiding the legs out from between the blades. Remove the sling from the hoist. Remove the retaining bands (Tool 1166) from the rotor blades.
- (7) Place a protector/blank (Tool 1349) on top of the rotor blades, and a convenient size disk over the centre hole in the rotor disk.
- (8) Turn the assembly pins as required to align the flat on the bolthead with the wall of the spacer ring, pull up on the pins until all the thread and a waisted portion of the bolt is visible. If any of the bolts are too tight to pull up with the assembly pins, screw the mechanical puller (Tool 1064) onto a pin, then insert the locating key (Tool 987) into the assembly pin locating the key to the side of the step in the bolthead with the step face on the bolt facing the case. Lock the locating key by screwing the thumbnut onto the assembly pin, then turn the locating handle until it points towards the centre of the rotor, this aligns the flat on the bolthead with the case. Screw

OVERHAUL

down on the puller tommy bars and draw the bolt up until it abuts the spacer ring front flange. Release and remove the locating key and assembly tool. Repeat this procedure on any bolts that are tight.

S. Assemble the Rotor Shaft Front to the Stage 1 Rotor Disk (Ref.Fig.533).

NOTE: Before assembling the rotor shaft front (03/1-90) refer to SB.72-30 and SB.72-79.

- (1) Remove the disk covering the centre hole in the stage 1 rotor disk. Establish the datum hole in the rotor shaft front (03/1-90), then align the datum holes of the rotor shaft and rotor disk and lower the rotor shaft over the assembly pins/rotor bolts to abut the stage 1 rotor disk.
- (2) Apply lubricant 'B' to the nut threads, then pass the nuts over the assembly pins and screw the nuts onto the rotor bolts, but do not tighten. Remove the assembly pins (Ref.Fig.534).
- (3) Using a torque wrench and socket, tighten the nuts in the following sequence - 1, 8, 4, 11, 6, 13, 3, 10, 5, 12, 2, 9, 7 and 14, in increments of 20 lbf ft (27,1 N.m), to a final torque of between 57 and 63 lbf ft (77,3 and 85,4 N.m). Locking (run-down) torque 18 lbf in. (2,0 N.m).
- (4) Recheck the datum alignment marks between the stage 1 rotor disk and the rotor shaft front.

T. Assemble the Roller Bearing Inner Track to Rotor Shaft Front.

- (1) Place the roller bearing inner track (03/1-30) in the oven and allow the track to heat up to 120 deg for 15 minutes.

NOTE: Since the inner track will lose its heat quite rapidly after being removed from the oven, it will be an advantage to prepare the mechanical driver before removing the track from the oven.

- (2) Turn the tommy bar of the mechanical driver (Tool 634) to extend the screw and pivoting plate in the forward position (Ref.Fig.534).
- (3) Wearing protective gloves, remove the inner track from the oven and with the part number marked on the inner track uppermost, place it on top of the rotor shaft front.
- (4) Lift the mechanical driver (Tool 634) over the shaft and inner track, then manipulate the pivoting plate through the rotor shaft bore, aligning the cut-outs in the plate with the self-locking nuts inside the rotor shaft.
- (5) Supporting the mechanical driver with the hand nut, screw the tommy bar down so that the ring locates on the inner track correctly, then operate the tommy bar and press the track onto the shaft.
- (6) Check with a feeler gauge to ensure the inner track abuts the step on the rotor shaft front. Release and remove the mechanical driver.
- (7) Remove the protector/blank (Tool 1349), then using feeler gauges, check the tip clearance between the stage 1 rotor blades and the compressor case. Find the longest and shortest blades and check the max. and min. tip clearance at eight equi-spaced points, then find the average max. and min. tip clearance. Refer to the Fits and Clearances Schedule (72-30-00) FCS 25. Replace the protector/blank (Tool 1349) if the assembly is not to be worked on immediately.

11. Assemble the Front Bearing Adapter and Prepare LP Compressor Assembly for Concentricity Checks

A. Assemble the Guide Adapter to the Rotor Shaft Front and Prepare the Bearing Adapter.

- (1) Assemble the guide adapter (Tool 582) to the rotor shaft front.

SUB-ASSEMBLY

- (2) Check that a balancing bearing is in position in the front bearing adapter and secured by its retaining plate. Lubricate the balancing bearing with lubricant 'A', also apply lubricant 'A' to the bearing inner track assembled to the rotor shaft front.

B. Assemble the Front Bearing Adapter to the LP Compressor Case (Ref.Fig.535).

NOTE: If assembled, remove Stop End (Tool 3160).

- (1) Offer the lifting fixture (Tool 1096) to the front bearing adapter (Tool 588) aligning the offset bolt, then screw in and fully tighten the bolts.
- (2) Attach a hoist to the lifting fixture, then raise the hoist and position it over the LP compressor case. Remove the protector/blank (Tool 1349) (if assembled) from the rotor blades. Steadily lower the hoist engaging the front bearing adapter over the guide adapter, and aligning the lifting eye on the adapter with the lifting eye on the slave exit guide blade case, and the bolt-holes in the adapter flange with the bolt-holes in the LP compressor case flange. Secure the adapter to the case with slave nuts and bolts. Disconnect the hoist then release and remove the lifting fixture. Withdraw the guide adapter from the rotor shaft front.

C. Raise the LP Compressor Assembly from the Build Stand and Locate in the Extension Stand.

NOTE: When lifting the compressor assembly with Tool 1096 ensure that the plate has eight captive bolts.

- (1) Locate the lifting fixture (Tool 1096), observing the offset bolt, onto the bearing adapter, then fully tighten the eight bolts.
- (2) Attach a hoist to the lifting fixture, remove the five knurled nuts securing the rear adapter to the build stand, then steadily raise the hoist until well clear of the stand (Ref.Fig.536).

- (3) Offer the trunnion adapter (Tool 1097) to the balancing bearing assembly. Ensure that the trunnion bar is at right angles to the lifting eye on the slave exit guide blade case, then secure with 7 off retaining bolts.

CAUTION: ENSURE THE SUPPORT STAND (TOOL 1076) LATCHES ARE FULLY ENGAGED BEFORE ATTEMPTING TO LIFT/PIVOT THE ASSEMBLY.

- (4) Position the hoist over the support stand (Tool 1076) (Ref.Fig.537). Disengage the two latches on the stand, then steadily lower the assembly engaging the trunnion adapter (Tool 1097) bar into the two recesses in the stand. Secure the trunnion adapter bar with the two latches of the stand.

CAUTION: ENSURE THAT THE LIFTING FIXTURE EYE PLATE PIVOTS AS THE ASSEMBLY IS LOWERED.

- (5) Moving the hoist as necessary and ensuring the adapter lifting eyes are on top, lower the front end of the assembly pivoting about the trunnion adapter, and rest the front adapter on the support (Tool 1306), moving the support as required to align it with the channel in the adapter (Ref.Fig.537).
- (6) Disconnect the hoist from the lifting fixture, then attach the lifting beam (Tool 1056) to the hoist. Position the beam over the top of the assembly with the lifting bar position handle at the front end of the compressor case. Secure the beam to the lifting eye on the front adapter and the slave exit guide blade case with shackles (Ref.Fig.538).
- (7) Remove the lifting fixture (Tool 1096) from the front bearing adapter and compressor rotor (Ref.Fig.536).

- (8) Release the latches of the stand (Tool 1076), then steadily raise the hoist adjusting the lifting beam (if required) to support the compressor assembly in the horizontal position. Ensure that supports (Tool 1073) with their respective spacers (Tool 1074 and Tool 1075) are assembled to the surface table (Ref.Fig.539). Spacer (1075) locates in the front bearing adapter channel, and spacer (1074) locates in the rear bearing adapter channel. Position the hoist over the two supports (Tool 1073) assembled to the surface table. Release and adjust the supports (if required) so that the channel section in the front and rear adapters aligns with the supports, then fully tighten the clamping bolts of the supports. Steadily lower the hoist and locate the adapter channels on the supports. Assemble and secure clamp plates to the supports.
- (9) Unbolt and remove the trunnion adapter (Tool 1097) from the balancing bearing assembly.

12. Carry out Concentricity and Swash Checks of LP Compressor Assembly

NOTE: All readings are to be taken at eight equi-spaced positions.

A. Check the Roller Bearing, the Stage 1 and Stage 7 Rotor Disks (Ref.Fig.539).

- (1) Check the swash of the front bearing inner race. It must not exceed 0.001 in. (0,0254 mm).
- (2) Check the concentricity of the front bearing inner race. It must not exceed 0.001 in. (0,0254 mm).

- (3) Check the swash of the stage 1 rotor disk ensuring that the check is taken at the largest diameter possible, just inboard of the balancing bolts on the disk and not on the blade roots. The swash must not exceed 0.004 in. (0,101 mm).
- (4) Check the swash of the stage 1 rotor disk, ensuring that the check is taken on the disk and not on the blade roots. The swash must not exceed 0.004 in. (0,101 mm).

### 13. Carry Out Dynamic Balance of the LP Compressor Assembly

#### A. Assemble the LP Compressor Assembly to the Balancing Machine.

- (1) Remove the three Allen screws (if assembled) from the splined driving adapter (Tool 603) end face, and ensure the end face has a zero mark in line with the master spline, then assemble the distance piece (Tool 660) to the adapter. Aligning the master splines of the rotor shaft rear and the splined driving adapter, offer the adapter into the rotor shaft, until the distance piece abuts the end of the rotor shaft. Offer the driving adapter retaining ring over the adapter and screw it into the rotor shaft using wrench (Tool 662) to tighten the ring.
- (2) Offer the driving pulley (Tool 661) to the end face of the driving adapter, aligning the master spline zero mark on the adapter with the degree zero mark on the pulley, then assemble the three Allen screws to the pulley and screw them into the adapter. Fully tighten the screws using wrench (Tool 1572).

CAUTION: ENSURE BALANCING MACHINE IS SWITCHED OFF.

- (3) With the lifting beam Tool 1056) and hoist still assembled to the LP compressor assembly, release and remove the clamp plates from the pedestals on the surface table, then steadily raise the hoist disengaging the adapters from the pedestals.
- (4) Position the compressor assembly over the balancing machine.
- (5) Adjust the front and rear pedestals to accommodate the compressor assembly correctly in the balancing machine.

- (6) Lock the front and rear pedestals.
- (7) Lower the hoist and guide the adapter channels onto the balancing machine pedestal adapters (Ref.Fig.540). Assemble and secure clamp plate to the pedestals.
- (8) Release the shackles, then remove the lifting beam from the LP compressor assembly and lower it onto a suitable container. Disconnect the hoist from the beam.
- (9) Secure the drive coupling to the balancing adapter in the rear of the LP compressor with the four nuts.

B. Dynamically Balance the LP Compressor Assembly.

NOTE: For balancing bolts, weights and nuts refer to the IPC 72-31-03, Fig.1 and 3.

- (1) Remove the immobilisers (Tools 3157 and 3158). Fit the Stop End (Tool 3160), to the front bearing adaptor (Ref.Fig.540).
- (2) Set the axial position of the rotor by moving the rotor shaft fully forwards. Measure the distance from the front face of the front bearing adaptor stop end (Tool 3160) to the forward face of the LP Compressor Front Shaft, record the dimension (min.). Move the rotor fully rearwards away from the adaptor plate, record the dimension (max.). Position the rotor mid-way between the min. - max. positions. Lock the drive shaft and recheck the setting dimension (Ref.Fig.540).
- (3) Start the balancing machine and ensure correct rotation of the rotor.

NOTE: Rotation to be set reverse to normal engine rotation i.e. CCW from the front.

- (4) Set the balancing machine speed to 600 RPM. Run the rotor for a minimum of 10 minutes to allow for temperature stabilisation throughout the rotor.
- (5) Index the rotor.

- (6) Run the rotor a minimum of 3 times to check for repeatability of unbalance indication. At each full stop, record the results obtained.
- (7) Once acceptable repeatability has been demonstrated record the rotor initial unbalance figures at 600 RPM.
- (8) Check the calibration of the machine by fitting a known weight at a known angle to the rotor, run the machine and check for correct indication. If the calibration is acceptable, remove the calibration weight.
- (9) Balance the rotor using weights as required. Prior to recording the final unbalance results for the rotor, ensure repeatability of indications by running the rotor to speed over a minimum of 3 runs at 600 RPM. Record the results.
- (10) Re-assemble immobilisers (Tools 3157 and 3158).
- (11) Remove the rotor from the balancing machine.

#### 14. Prepare the LP Compressor Assembly for Final Engine Build

##### A. Remove the LP Compressor Assembly from the Balancing Machine (Ref.Fig.543).

- (1) Attach a hoist to the lifting beam (Tool 1056), then position the hoist over the balancing machine with the lifting bar position handle at the front end of the LP compressor case. Secure the beam to the lifting eyes on the front and rear adapters with shackles.
- (2) Release and remove the clamp plates from the balancing machine pedestals, then steadily raise the hoist and position the compressor over the two supports (Tool 1306 and 1076). Lower the hoist and guide the rear adapter channel section onto the stands.
- (3) Identify the offset bolt-hole position in the adapter, then assemble the trunnion adapter (Tool 1097) to the front bearing adapter. Screw in and fully tighten the bolts.

SUB-ASSEMBLY

**72-31-00**

Page 598.9

sneema

- (4) Ensure the two latches of the support (Tool 1076) are released. Raise the hoist and position the assembly so that the trunnion adapter aligns with the support stand (Tool 1076), and the channel in the rear bearing adapter aligns with the (moveable) support (Tool 1306), then lower the assembly onto the supports. Secure the trunnion adapter bar with the two latches of the support.
- B. Assemble the LP Compressor Assembly to the Mobile Stand.
- (1) Release the shackles, then remove the lifting beam (Tool 1056) from the compressor assembly and the beam from the hoist.
  - (2) Using wrench (Tool 1572), release the Allen screws and remove the drive pulley from the driving adapter in the rotor shaft rear, then using wrench (Tool 662) release and remove the driving adapter retaining ring and withdraw the driving adapter from the rotor shaft.
  - (3) Assemble the lifting fixture (Tool 1096) to the front bearing adapter and compressor rotor (Ref.Fig.542).
    - (a) Locate the lifting fixture, observing the offset bolt, onto the bearing adapter, then fully tighten the eight bolts.
  - (4) Attach a hoist to the lifting fixture then moving the hoist as necessary, raise the rear end of the compressor assembly and pivot about the trunnion adapter until the assembly is vertical (Ref.Fig. 543). Release the two latches of the stand and raise the hoist. Position the hoist over the mobile stand (Tool 1105) (Ref.Fig.544) aligning the front bearing adapter lifting eye with the slot in the mobile stand, then lower the assembly onto the stand. Locate the stand clamps on the compressor casing front flange and tighten the knurled nuts. Release and remove the hoist from the lifting equipment.

C. Attach the Module Identification Plate to the LP Compressor Case.

- (1) Ensure that the module identification plate (72-00-02/1-70) bears the correct data.
- (2) On Pre-SB.72-21 standard engines, ensure that an identification label bearing the sub-assembly/module data and washer thickness is attached to the LP thrust bearing adjusting washer, and passed to engine final build (72-00-00, Assembly).
- (3) Place the module identification plate in a canvas bag, then temporarily attach it to one of the blow-off flanges as a 'loose item'.

NOTE: If the LP compressor assembly is to be stored the module identification plate must not be removed.

- (4) Check that an identification tally has been affixed to the LP compressor exit guide vane cases. The LP compressor assembly together with the exit guide vane cases are now ready for engine final build (72-00-00 Assembly).

LP COMPRESSOR CASE AND VANES - SUB-ASSEMBLY

1. General

- A. Prior to commencing work on the LP case, refer to 72-09-00 Assembly for general information on assembly.
- B. During the sub-assembly procedure, reference will be made to the Illustrated Parts Catalogue (I.P.C.) to identify those items where the nomenclature does not positively identify them, due to the duplication of the title e.g. nuts, bolts, washers, bearings, gears, housings, tubes etc. When the item is part of the breakdown of the text concerned, the item will be identified as bolt (1-10), the 1 referring to the I.P.C. Fig.1, and the 10 referring to the Item No. Where items from a different breakdown are introduced, then the breakdown Number will be quoted in addition, e.g. bolt (72-32-01/1-10).
- C. Throughout the text special tools are quoted by their Ref.No. e.g. (Tool 1234). For a complete list of tooling required for the assembly and for the Manufacturers Part No., refer to Special Tools, Fixtures and Equipment Table 1002.
- D. The LP case will be assembled to its turnover build stand where the stage 6 stator vanes will be finally assembled. All necessary brackets will be bolted to their respective flanges. The case will then be removed from the stand and placed front flange uppermost onto a pallet where the spherical bushes, spherical bearings, pins and front mounting bracket will be assembled.
- E. After completion of work on the LP case, items as necessary will be assembled to stages 1 to 5 labyrinth rings/fixing rings in preparation for final build of the compressor. The LP case and labyrinth rings/fixing rings will then be transferred to the final sub-assembly build area, with any loose items, for the final build of the remaining stages of stator vanes and rotor disks.

## 2. Assemble the LP Compressor Case to the Build Stand

### A. Prepare the LP Case.

NOTE: Before commencing work refer to SB.72-19, SB.72-45, SB.72-37 and SB.72-54.

- (1) Check that the case (6-100) is clean and free from damage marks.

NOTE: Adopt the operations given in para.B. or C. depending on whether the LP case is resting on its front or rear face.

### B. Assemble Case to Stand (With Case on its Front Face).

- (1) Assemble the multiple leg sling (Tool 1178) to the rear flange of the LP case at three equally spaced positions, then secure the sling with the six thumbnuts. Turn the build stand (Tool 1317) until the build plate is uppermost.
- (2) Raise the case above the build stand (Ref.Fig.501). Slacken the clamping plate retaining nuts, then slide the plates back so that they do not obstruct the case when lowering. Turn the case until the 'TOP' of the case aligns with the 'TOP' of the build stand plate.
- (3) Check that the extraction pads on the underside of the build plate do not protrude to foul the case flange.
- (4) Carefully lower the case over the guide pins. Slide the clamp assemblies onto the case flange, then secure in position by tightening the retaining nut. Release and remove the sling.

### C. Assemble Case to Stand (With Case on its Rear Face).

- (1) Locate the arms of a small fork lift beneath the pallet then raise the pallet and case sufficiently to clear the floor.
- (2) Turn the build plate until its front face is facing down. Check that the clamping plates are slackened off and pushed outwards to clear the case.

OLYMPUS 593

MK.610-14-28 *sneema*  
OVERHAUL

- (3) With the LP case centrally disposed on the pallet, move the pallet and case beneath the build plate so that the 'TOP' of the case aligns the 'TOP' position of the build stand. Manipulate the fork lift to align the case front flange holes with the build plate guide pins. Raise the fork lift until the case front flange fully abuts the build plate.
- (4) Slide the clamping plates home over the case front flange, then secure the plates to the flange by tightening each of the retaining nuts.
- (5) Check that all clamps are securely clamped to the front flange of the case.
- (6) Lower the fork lift then remove the pallet clear of the build stand.

3. Assemble the Stage 6 Stator Vanes and Inner Fixing Ring to the Compressor Case

A. Assemble Items to Stage 6 Rings.

- (1) Remove the assembled labyrinth ring/fixing ring (3-400/390) from its container and place on the worktop with the labyrinth ring (3-400) uppermost.
- (2) Identify the loading slot in the fixing ring (3-390), then insert two new bolts (3-350) through the two holes at this position, the heads of the bolts are to locate the rear of the fixing ring. Using the assembly sleeve (Tool 1507) and driver (Tool 302) assemble a retaining ring (3-340) to each bolt. Ensure that the retaining rings locate correctly in the bolt grooves.
- (3) Install labyrinth retaining plates (Ref.Fig.507).

CAUTION: FAILURE TO INSTALL LABYRINTH RETAINING PLATES IN THE CONFIGURATION APPROPRIATE TO THE DESIGN STANDARD OF THE LABYRINTH RING WILL RESULT IN DAMAGE TO ENGINE.

SUB-ASSEMBLY

72-31-01

Page 504

Sep 30/94

# OLYMPUS 593

MK.610-14-28 *sneema*

OVERHAUL

Printed in England

- (a) The installed configuration for labyrinth retaining plates is dependent upon the design standard of the labyrinth ring. There are two design standards of labyrinth ring in use.
  - (i) The retaining plate location on early labyrinth rings is flush with the vane fixing ring and the retaining plate is installed with its recessed face toward the retaining nut (Detail A).
  - (ii) The retaining plate location on later labyrinth rings has a lipped edge which projects forward of the vane fixing ring and the retaining plate is installed with its recessed face toward the lipped edge (Detail B).
- (b) Before proceeding to install labyrinth retaining plates, establish from the design standard of the labyrinth, which installed configuration is applicable.
- (c) Insert six new bolts (3-370) through the rear of the fixing ring into the remaining three pairs of equi-spaced holes. Secure the three pairs of bolts (3-370) with retaining plates (3-380) and nuts (3-360) lubricated with lubricant 'B'. Ensure that the retaining plates locate the labyrinth ring (3-400) correctly.
- (4) Immobilize each of the six bolts (3-370) with the holding tool (Tool 926), then torque-tighten the six bolts (3-370) between 85 and 95 lbf in. (9,6 and 10,7 N.m) ensuring a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 2.5 thread pitches beyond nut chamfer, the bolt must be renewed (Ref.SB.72-8259-153).

- (5) On engines to SB.72-8730-298 or SB.72-9061-434 standard, install anti-fret liners (Ref.Fig.501A).

NOTE: If at refurbishment of an engine to SB.72-8730-298 standard, the front liner (3-410) needs replacement, liners to the standard of SB.72-8730-298 should be offered up. If insufficient tang extension exists to allow the tang to overhang the fixing ring 0.050 in (1,27 mm) prior to peening, then an SB.72-9061-434 standard liner must be used. As a consequence the fixing Ring Assy. of must be re-part numbered as detailed in SB.72-9061-434. Any excess tang must be dressed to remove.

- (a) Assemble the front and rear liners (3-410 and 3-420) to the inner fixing ring, and clamp in position for peening using two restraining tools (Tool 3134).
  - (b) Peen the ends of the liners with a soft metal drift, radiused at the end, then assemble the retaining protector (Tool 3140) to the fixing ring.
- (6) Return the labyrinth ring/fixing ring to its protective container.

B. Deleted.

C. Prepare to Assemble Stator Vanes and Inner Fixing Ring.

- (1) Using the build stand's cranked handle, turn the build stand (Tool 1317) until the case is horizontal.
- (2) Remove the stage 6 vanes (3-300, 3-310, 3-320 and 3-330) and the vane fixing ring (3-390) from their protective containers and place on a suitable worktop.

NOTE: Ensure that any repaired vanes are evenly distributed around the case and that the aggregate depth of blending does not exceed 1.800 in. (45,72 mm) (Ref.72-31-01 Repair No.2).

- (3) Lubricate the vane fixing ring and the stage 6 stator vane grooves in the LP case with lubricant 'A'.

D. Assemble the Vanes (Ref.Figs.502 and 503).

- (1) Assemble a bolted stator vane (3-310) to the loading slot of the vane fixing ring, then slide the vane to a position opposite the loading slot (Ref.Fig.502).

NOTE: For easy identification purposes, note that the heads of the bolts in the fixing ring face the rear.

- (2) Offer up the vane fixing ring and assembled bolted vane to the rear of the LP case, then slot the vane into the stage 6 grooves. Carefully supporting the fixing ring, slide the stator vane around the case simultaneously rotating the fixing ring until its loading slot is in line with the case loading slot opposite. If necessary adjust the bolted vane to align the bolt holes in the case.

- (3) Assemble two sleeves (3-220) and two bolts (3-210), lubricated with lubricant 'B', from outside the case to locate the bolted vane. Do not tighten the bolts at this stage.
- (4) Assemble a vane (3-300) to the case and vane fixing ring, slide the vane to within approx. one inch of the loading slot to act as a support to help centralize the inner fixing ring.  
  
Assemble a vane (3-300) so that it abuts the first bolted vane assembled, then assemble subsequent vanes (3-300) in a counter-clockwise direction looking forward until the probe holes in the bottom of the case are left exposed.
- (5) Assemble two probe vanes (3-330) and position at the bottom of the case. Check that the probe holes in the case and corresponding holes in the vanes line up.
- (6) Assemble a plug support (3-250) to the outside of the LP case at the two probe positions. Lubricate two bolts with lubricant 'B', then secure the plug support (finger tight) to the case and probe vanes. Assemble two blanking plugs (3-240) to the plug support, then secure the blanking plugs to the plug support with two bolts (3-230) lubricated with lubricant 'B'. Ensure that the two bolts (3-230) have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m), do not tighten the bolts at this stage.
- (7) Assemble a vane (3-300) to the case so that it abuts the probe vane, continue to assemble vanes (3-300) until the loading slot is reached.
- (8) Progress with vanes (3-300) in the remaining half of the case up to the next bolted vane position, then assemble a bolted vane (3-310) and secure to the outside of the case with two bolts (3-210) lubricated with lubricant 'B' and two sleeves (3-220). Do not tighten the bolts at this stage. With the bolted vane in position assemble the remaining vanes (3-300).
- (9) Finally assemble a bolted vane (3-320) to the case and inner fixing ring. Secure the vane at the outer position with two bolts (3-210) lubricated with lubricant 'B' and two sleeves (3-220). Check that the two retaining rings (3-340) at the inner fixing ring loading position are correctly assembled to their

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

grooves, then assemble a retaining piece (3-290) over the two bolts (3-350). Lubricate the two nuts (3-280) with lubricant 'B' then secure the retaining piece using the immobilizer (Tool 926) to secure the bolts.

- (10) Check that all the bolted vanes have been correctly assembled and that all the vanes between the bolted vanes have acceptable lateral movement.
- (11) Torque-tighten the following bolts and nuts:
- (a) TOP outer case position (bolted vane) between 80 and 90 lbf in. (9,0 and 10,2 N.m).
  - (b) The right-hand bolted vane (outer case position) between 80 and 90 lbf in. (9,0 and 10,2 N.m).
  - (c) The bottom two probe vanes (outer case position) and plug support retaining bolts (3-230) between 80 and 90 lbf in. (9,0 and 10,2 N.m).
  - (d) The left-hand bolted vane at the outer case position between 80 and 90 lbf in. (9,0 and 10,2 N.m).
  - (e) The left-hand bolted vane at the inner fixing ring position between 85 and 95 lbf in. (9,6 and 10,7 N.m). After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 2.5 thread pitches beyond nut chamfer, the bolt must be renewed (Ref.SB.72-8259-153).
- (12) Check that the probe blades are correctly positioned by inserting the probe pin gauge (Tool 289) through the case and the holes in the vanes.
- (13) Wire-lock the bolts at the bolted vane positions in pairs.

4. Assemble Brackets, Blanking Plate or Pulse Probe and Bolts to the LP Case

- A. Assemble Brackets and Bolts to the Rear Blow-off Flange (Ref.Fig.504).

NOTE: All the bracket retaining bolt threads will be lubricated with lubricant 'B' and unless qualified in the text the bolt heads are to face the front and the brackets to abut the rear face of the flange. Unless stated otherwise the self-locking nuts and inserts will have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).

SUB-ASSEMBLY

**72-31-01**

Page 511

Feb 1/82

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (1) Turn the stand so that the LP case is vertical (rear flange uppermost).
- (2) Assemble a bracket (5-30) to location P. Secure the bracket with two bolts (5-20) and two nuts (5-10).
- (3) Assemble a bracket (5-60) and two bolts (5-50) to location N, retain the bracket with two nuts (5-40).
- (4) Assemble a bracket (5-110) and bolts (5-80) and (5-100) to location M, retain the brackets with nuts (5-70) and (5-90).
- (5) Assemble a bracket (5-140) and two bolts (5-130) to location L, retain the brackets with nuts (5-120).
- (6) Assemble a bracket (5-180) to location K (holes 26, 27). Assemble a bolt (5-160) and nut (5-150) to hole 26. Do not tighten the bolt at this stage. Assemble the bracket (5-190) underneath the flange to holes 27, 28 and 29, then assemble a bracket (5-200) on top of the flange to holes 28, 29. Secure the brackets at hole 27 with bolt (5-160) and nuts (5-150) and holes 28 and 29 with bolts (5-160) and (5-170) and nuts (5-150).
- (7) Assemble a bracket (5-230) to location J and secure with two bolts (5-220) and nuts (5-210).
- (8) Assemble a bracket (5-270) with the leg of the bracket extended rearward, to location H. Secure the bracket with two bolts (5-260), two washers (5-250) and two nuts (5-240). The washers are to be assembled between the nut and the bracket.
- (9) Assemble the bracket (5-360) to the front face of the flange at location G so that the bracket extends forward, then assemble the bracket (5-300) to the rear face of the flange to extend rearwards; secure the brackets with two bolts (5-290) and nuts (5-280).
- (10) Assemble the bracket (5-410) to the flange at location F with the bracket extending rearwards; retain the bracket with an attachment plate assembly (5-430) on the front face of the flange then assemble the bracket (5-420) to the flange, the leg of this bracket will locate one hole (38) of bracket (5-410). Secure the brackets at the attachment plate position with bolt (5-380) outer location of bracket (5-420) with bolt (5-400) and its inner location with bolt (5-390) and four nuts (5-370).

SUB-ASSEMBLY

**72-31-01**

Page 512  
Feb 1/82

- (11) Assemble a bracket (5-460) to the front face of the flange at location E with the bracket extending forward; retain the bracket with two bolts (5-450) and nuts (5-440).
- (12) Assemble a bracket (5-490) to the rear face of the flange at location D, then assemble the bracket (5-500) to the front face of the flange with the bracket extending forward. Retain both brackets with two bolts (5-480) and two nuts (5-470).
- (13) Assemble a bracket (5-530) to the flange at location C, the bracket extends forward. Retain the bracket with two bolts (5-520) and two nuts (5-510).
- (14) Assemble a bracket (5-560) to location B with the bracket extending forward. Retain the bracket with two bolts (5-550) and two nuts (5-540).
- (15) Torque-tighten the bolt at location F (half pitch between holes 39 and 40) between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (16) Torque-tighten the remainder of the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m).

#### B. Assemble Blanking Plate or Pulse Probe.

- (1) If SB.71-8314-28 is embodied, assemble a blanking plate (6-98) together with a bracket (6-96) to the left-hand bottom position of the LP case (LP probe location). Secure the bracket and blanking plate with two bolts (6-93) and one bolt (6-92). Torque-tighten the three bolts between 80 and 90 lbf in. (9,0 and 10,2 N.m), ensuring a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).
- (2) If the engine is to Pre SB.71-8314-28 standard, assemble the pulse probe (73-22-01/1-10) and bracket (73-22-01/1-40) to the left-hand bottom position of the LP case. Retain the bracket and pulse probe with two bolts (73-22-01/1-30) and one bolt (73-22-01/1-20) lubricated with lubricant 'B'. Torque-tighten the three bolts between 80 and 90 lbf in. (9,0 and 10,2 N.m), ensuring a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Assemble a protector to the pulse probe.

Assembling Brackets to Front Blow-off Flange  
Figure 505

SUB-ASSEMBLY  
**72-31-01**  
Page 514  
Oct 1/77

C. Assemble Brackets and Bolts to the Front Blow-off Flange (Ref.Fig.505).

- (1) Assemble a mounting bracket (4-70) to location D, with its longest section extending rearward. Secure the bracket with two bolts (4-60) (boltheads to face the rear), and two nuts (4-50). Torque tighten the two nuts until the 'shear neck' parts, then discard the severed hexagons.

NOTE: The rear of the bracket will be finally secured during the LP compressor assembly build (Ref. 72-31-00 Assembly).

- (2) Assemble a bracket (4-100) and two bolts (4-90) and nuts (4-80) to location E. The bracket abuts the rear of the flange with the one hole extended forward. Retain the bracket with two nuts (4-80).
- (3) Assemble bracket (4-130) and bracket (4-125) to the flange at location F. The bracket (4-130) is assembled first on the rear of the flange with longest section of the bracket extended forward, the smaller bracket locates on the first bracket extending rearwards. Secure the two brackets with two bolts (4-120) and nuts (4-110).
- (4) Assemble the flanged connector (4-320) to location G and secure with two bolts (4-310) and two nuts (4-300). Assemble three protective blanks to the electrical outlets on the connector.
- (5) Assemble bracket (4-430) and lug support (4-440) to location H. Retain the bracket (4-430) at hole 45 with a bolt (4-410) and locknut (4-400), and support (4-440) at holes 46, 47 with two bolts (4-420).
- (6) Assemble two special flange bolts (4-460) to location J. Secure the special bolts with two lock-nuts (4-450) onto the front face of the flange.
- (7) Assemble a bracket (4-490) and two bolts (4-480) to location K, secure the bracket with two nuts (4-470).
- (8) Torque-tighten the bolts at location H, bolt holes 46, 47 between 80 and 90 lbf in. (9,0 and 10,2 N.m). Wire-lock these two bolts to each other.
- (9) Torque-tighten the remainder of the bracket retaining bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m).

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (10) Assemble a bracket (5A-590) to the bottom left-hand location (looking forward) of the LP case, the bracket is attached to a small separate flange just behind the front blow off flange, close to bolt hole 54. Lubricate two bolts (5A-580) with lubricant 'B' then secure the bracket with the bolts (the boltheads to face the rear) and two nuts (5A-570). Torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m).

5. Assemble Spherical Bearings, Bushes, Pins and Mounting Bracket

A. Remove the LP Case from the Build Stand.

- (1) Check that the LP case is securely clamped to the build stand, then turn the stand until the rear flange (small diameter) is towards the floor.
- (2) Locate the support arms of a small fork lift beneath a pallet, then transfer the pallet beneath the rear flange of the LP compressor case. Raise the fork lift to abut the compressor case rear flange and take the weight of the compressor case sufficiently to take the downward load from the clamping plates.
- (3) Slacken the clamping plate retaining nuts then slide the plates clear of the compressor case flange. Adjust the hydraulic release on the fork lift to allow the LP case to ease down. Check that the build stand mounting plate is level, then continue to lower the compressor case until clear of the mounting plate. Withdraw the pallet with the compressor clear of the build stand, then lower the pallet onto the floor.

B. Shrink Pins to Front Flange (Ref.Fig.506).

- (1) Using a suitable freezing agent, freeze a shouldered pin (6-460), then assemble it to the TOP front face of the flange at location D. Ensure that the shoulder of the pin is flush or slightly below the air intake abutment face of the flange.

OVERHAUL

NOTE: Depending on the standard of case, assemble either pin (6-470A) or pin (6-470B). The smaller diameter baulk pin is to the later standard.

- (2) Freeze pin (6-470), then assemble it to location C. (Ref.Fig.506).

C. Assemble Spherical Bearings and Bushes.

- (1) Ensure two bushes (6-50) are clean and free from damage and their corresponding locations clean (Ref.Fig.506).

NOTE: The flange of each bush (6-50) is to abut the front face of the flange.

- (2) Using a suitable freezing agent shrink the two bushes (6-50) then assemble them to the front face of the front flange of the LP case.

NOTE: The two bushes (6-50) locate the two flanged pins (6-30) for the mounting bracket.

- (3) Assemble four spherical bushes (6-90) to their locations (two at B and similar each side of the mounting bracket) in the LP case front flange (Ref.Fig.506) the lug of each bush is to locate the rear face of the flange. Adjust the bushes to align the bolt holes, then, retain the two bushes at B with two bolts (6-80), lubricated with lubricant 'B' (bolt-heads to face the rear), and two nuts (6-70). Torque-tighten the bolts between 80 and 90 lbf in. (9,0 and 10,2 N.m) ensuring that they have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).
- (4) Assemble four spherical bearings (6-60) to the four bushes (6-90). Temporarily retain the spherical bearings with locking wire.

OVERHAUL

D. Assemble Pins and Mounting Bracket.

NOTE: The pin (6-470) at position C (Ref.Fig.506) permits the mounting bracket to be assembled one way only, boltheads to face the rear.

- (1) Assemble the mounting bracket (6-40) to the 'TOP' position on the LP case front flange (Ref.Fig.506). Assemble the two pins (6-30) to the bracket so that the flange of the pin abuts the rear of the bracket, then retain the bracket, two spherical bushes (6-90) and pins with two bolts (6-20) lubricated with lubricant 'B' and two nuts (6-10). Torque-tighten the bolts (6-20) between 80 and 90 lbf in. (9,0 and 10,2 N.m) ensuring that they have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).

6. Assemble Items to Inner Fixing Rings

A. Deleted.

B. Labyrinth Retaining Plate Installation (Ref.Fig.507).

CAUTION: FAILURE TO INSTALL LABYRINTH RETAINING PLATES IN THE CONFIGURATION APPROPRIATE TO THE DESIGN STANDARD OF THE LABYRINTH RING WILL RESULT IN DAMAGE TO ENGINE.

- (1) The installed configuration for labyrinth retaining plates is dependent upon the design standard of the labyrinth ring. There are two design standards of labyrinth ring in use.
  - (a) The retaining plate location on early labyrinth rings is flush with the vane fixing ring and the retaining plate is installed with its recessed face toward the retaining nut (Detail A).
  - (b) The retaining plate location on later labyrinth rings has a lipped edge which projects forward of the vane fixing ring and the retaining plate is installed with its recessed face toward the lipped edge (Detail B).

- (2) Before proceeding to install labyrinth retaining plates at stages 1 to 5, establish from the design standard of the labyrinth, which installed configuration is applicable.

C. Assemble Items to Stage 1 Rings.

- (1) Remove the assembled labyrinth ring/fixing ring (1-190/180) from its container and place on the worktop with the labyrinth ring (1-190) uppermost.
- (2) Identify the vane loading slot in the fixing ring (1-180), then insert two new bolts (1-140) through the two holes at this position, the heads of the bolts are to locate the rear of the fixing ring. Using the assembly sleeve (Tool 1506) and driver (Tool 301), assemble a retaining ring (1-130) to each bolt. Ensure that the retaining rings locate correctly in the bolt grooves.
- (3) Insert six new bolts (1-160) through the rear of the fixing ring into the remaining three pairs of equispaced holes. Secure the three pairs of bolts (1-160) with retaining plates (1-170) and nuts (1-150) lubricated with lubricant 'B'. Ensure that the retaining plates locate the labyrinth ring (1-190) correctly.
- (4) Immobilize each of the six bolts (1-160) with the holding tool (Tool 926), then torque-tighten the six nuts (1-150) between 85 and 95 lbf in. (9,6 and 10,7 N.m), ensuring a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 2.5 thread pitches beyond nut chamfer, the bolt must be renewed (Ref. SB.72-8259-153).

- (5) On engines to SB.72-8690-296 or SB.72-9061-434 standard, install anti-fret liners (Ref.Fig.501A).

NOTE: If at refurbishment of an engine to SB.72-8690-296 standard, the front liner (1-94) needs replacement, liners to the standard of SB.72-8690-296 should be offered up. If insufficient tang extension exists to allow the tang to overhang the fixing ring 0.050 in (1,27 mm) prior to peening, then an SB.72-9061-434 standard liner must be used. As a consequence the fixing Ring Assy. of must be re-part numbered as detailed in SB.72-9061-434. Any excess tang must be dressed to remove.

- (a) Assemble the front and rear anti-fret liners (1-194 and 1-196) to the inner fixing ring and clamp in position for peening using two restraining tools (Tool 3134).
- (b) Peen the ends of the liners with a soft metal drift, radiused at the end, then assemble the retaining protector (Tool 3137) to the fixing ring.
- (6) Return the labyrinth ring/fixing ring assembly to its protective container.

#### D. Assemble Items to Stage 2 Rings.

- (1) Remove the assembled labyrinth ring/fixing ring (1-380/370) from its container and place on the worktop with the labyrinth ring (1-380) uppermost.
- (2) Identify the vane loading slot in the fixing ring (1-370), then insert two new bolts (1-330) through the two holes at this position, the heads of the bolts are to locate the rear of the fixing ring. Using the assembly sleeve (Tool 1506) and driver (Tool 301) assemble a retaining ring (1-320) to each bolt. Ensure that the retaining rings locate correctly in the bolt grooves.

## E. Assemble Items to Stage 3 Rings.

- (1) Remove the assembled labyrinth ring/fixing ring (2-200/190) from its container and place on the worktop with the labyrinth ring (2-200) uppermost.
- (2) Identify the vane loading slot in the fixing ring (2-190), then insert two new bolts (2-150) through the two holes at this position, the heads of the bolts are to locate the rear of the fixing ring. Using the assembly sleeve (Tool 1507) and driver (Tool 302), assemble a retaining ring (2-140) to each bolt. Ensure that the retaining rings locate correctly in the bolt grooves.
- (3) Insert six new bolts (2-170) through the rear of the fixing ring into the remaining three pairs of equi-spaced holes. Secure the three pairs of bolts (2-170) with retaining plates (2-180) and nuts (2-160) lubricated with lubricant 'B'. Ensure that the retaining plates locate the labyrinth ring (2-200) correctly.
- (4) Immobilize each of the six bolts (2-170) with the holding tool (Tool 926), then torque-tighten the six nuts (2-160) between 85 and 95 lbf in. (9,6 and 10,7 N.m), ensuring a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 2.5 thread pitches beyond nut chamfer, the bolt must be renewed (Ref. SB.72-8259-153).
- (5) On engines to SB.72-8730-298 or SB.72-9061-434 standard, install anti-fret liners (Ref.Fig.501A).

NOTE: If at refurbishment of an engine to SB.72-8730-298 standard, the front liner (2-204) needs replacement, liners to the standard of SB.72-8730-298 should be offered up. If insufficient tang extension exists to allow the tang to overhang the fixing ring 0.050 in (1,27 mm) prior to peening, then an SB.72-9061-434 standard liner must be used. As a consequence the fixing Ring Assy. of must be re-part numbered as detailed in SB.72-9061-434. Any excess tang must be dressed to remove.

- (5) On engines to SB.72-8730-298 or SB.72-9061-434 standard, install anti-fret liners (Ref.Fig.501A).

**NOTE:** If at refurbishment of an engine to SB.72-8730-298 standard, the front liner (2-410) needs replacement, liners to the standard of SB.72-8730-298 should be offered up. If insufficient tang extension exists to allow the tang to overhang the fixing ring 0.050 in (1,27 mm) prior to peening, then an SB.72-9061-434 standard liner must be used. As a consequence the fixing Ring Assy. of must be re-part numbered as detailed in SB.72-9061-434. Any excess tang must be dressed to remove.

- (a) Assemble the front and rear anti-fret liners (2-410 and 2-420) to the inner fixing ring and clamp in position for peening using two restraining tools (Tool 3134).
- (b) Peen the ends of the liners with a soft metal drift, radiused at the end, then assemble the retaining protector (Tool 3140) to the fixing ring.
- (6) Return the labyrinth ring/fixing ring assembly to its protective container.

#### G. Assemble Items to Stage 5 Rings.

- (1) Remove the assembled labyrinth ring/fixing ring (3-200/190) from its container and place on the worktop with the labyrinth ring (3-200) uppermost.
- (2) Identify the vane loading slot in the fixing ring (3-190), then insert two new bolts (3-150) at this position, the heads of the bolts are to locate the rear of the fixing ring (3-190). Using the assembly sleeve (Tool 1507) and driver (Tool 302), assemble a retaining ring (3-140) to each bolt. Ensure that the retaining rings locate correctly in the bolt grooves.
- (3) Insert six new bolts (3-170) through the rear of the fixing ring into the remaining three pairs of equi-spaced holes. Secure the three pairs of bolts with retaining plates (3-180) and nuts (3-160) lubricated with lubricant 'B'. Ensure that the retaining plates locate the labyrinth ring (3-200) correctly.

SUB-ASSEMBLY

MK.610-14-28  
OVERHAUL

sneema

- (4) Immobilize each of the six bolts (3-170) with the holding tool (Tool 926), then torque-tighten the six nuts (3-160) between 85 and 95 lbf in. (9,6 and 10,7 N.m) ensuring a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 2.5 thread pitches beyond nut chamfer, the bolt must be renewed (Ref. SB.72-8259-153).

- (5) On engines to SB.72-8690-298 or SB.72-9061-434 standard, install anti-fret liners (Ref.Fig.501A).

NOTE: If at refurbishment of an engine to SB.72-8730-298 standard, the front liner (3-204) needs replacement, liners to the standard of SB.72-8730-298 should be offered up. If insufficient tang extension exists to allow the tang to overhang the fixing ring 0.050 in (1,27 mm) prior to peening, then an SB.72-9061-434 standard liner must be used. As a consequence the fixing Ring Assy. of must be re-part numbered as detailed in SB.72-9061-434. Any excess tang must be dressed to remove.

- (a) Assemble the front and rear anti-fret liners (3-204 and 3-206) to the inner fixing ring and clamp in position for peening using two restraining tools (Tool 3134).
- (b) Peen the ends of the liners with a soft metal drift, radiused at the end, then assemble the retaining protector (Tool 3140) to the fixing ring.
- (6) Return the labyrinth ring/fixing ring assembly to its protective container.

7. Deleted.

8. Transfer the LP Case to the Sub-assembly Final Build

A. Prepare the Case.

- (1) Ensure all flange attachment items have been correctly assembled and bolts torque-tightened.
- (2) Check that stages 1 to 5 (inclusive) labyrinth rings/fixing rings have been placed in the appropriate part of the container.
- (3) Check that the LP case is clean, then transfer the case and labyrinth rings/fixing rings with any loose items to the LP Compressor Assembly (Ref.72-31-00 Assembly).

OVERHAUL

LP COMPRESSOR EXIT GUIDE CASE AND VANES - SUB-ASSEMBLY

1. General

- A. Prior to commencing the assembly, refer to 72-09-00 Assembly for general information.
- B. During the sub-assembly procedure, reference will be made to the Illustrated Parts Catalogue (I.P.C.) to identify those items where the nomenclature does not positively identify them, due to duplication of the titles e.g. nuts, bolts, sleeves, blades etc. The item will be identified e.g. bolt (1-10), the 1 referring to the I.P.C. Fig.No., and the 10 referring to the Item No.
- C. The LP exit guide cases take up their position between the LP compressor case rear flange and the intermediate case front flange. The retaining rings assembled to the exit guide vane inner platforms, and retained to the vanes by 54 bolts, slide into corresponding sealing rings assembled to the LP compressor bearing housing assembly when the two half cases are assembled between the LP compressor/intermediate case on final engine build.
- D. The exit guide cases are manufactured as a matched pair and though the top and bottom cases have different part numbers, the cases carry the unit number and a matching symbol (which is usually the engine number). As the cases are matched, it is not recommended that either half case be interchanged with other cases in the event of defects.

2. Assemble the Exit Guide Vanes and Retaining Rings to the Exit Guide Cases (Ref.Fig.501)

- A. Prepare the Top and Bottom Exit Guide Cases.

NOTE: Before commencing work, refer to S.B.72-37 and S.B.72-110.

- (1) Check that the top and bottom exit guide cases are a matched pair.

NOTE: The front of the exit guide cases can be easily recognized by the vane groove position, the groove is machined nearer the rear flange.

- (2) Place the two cases (1-150) on a clean worktop, front flange uppermost. Apply lubricant 'A' to the grooves in the two half cases.

SUB-ASSEMBLY

**72-31-02**

Page 501

Mar 1/81

OLYMPUS 593

MK.610-14-28  
OVERHAUL

B. Assemble the Exit Guide Vanes to the Top Half Case.

NOTE: The exit guide vanes will be assembled to the top and bottom half cases with the convex curve of the vanes uppermost (facing towards the case front flange).

NOTE: Ensure that any repaired vanes are evenly distributed around the case and that the aggregate depth of blending does not exceed 0.200 in. (5,08 mm) (Ref.72-31-02 Repair No.1).

- (1) Insert 23 vanes (1-120) into the lubricated grooves of the top half exit guide case. Position the vanes in the case so that the bolt holes and probe holes at each end of the case are left uncovered.
- (2) Assemble two probe vanes (1-110) to the top half case ensuring that the holes in the vanes align the two large probe holes in the case, then assemble a bolted vane (1-100) so that it abuts the probe vane and does not protrude beyond the axial flange. Insert a bolted vane (1-90) in the other end of the case. Check that the two probe holes and the four bolt holes correlate with their respective vanes.
- (3) Apply lubricant 'B' to two blanking plugs (1-130) then assemble a washer (1-140) to each plug, screw the plugs into the probe holes in the top half case.
- (4) Assemble four sleeves (1-80) to four bolts (1-70), apply lubricant 'B' to the bolt threads then assemble the bolts to the two bolted vanes at either end of the case. Do not tighten at this stage.

C. Assemble the Exit Guide Vanes to the Bottom Half Case.

- (1) Insert 23 vanes (1-120) into the lubricated grooves of the bottom half exit guide case. Position the vanes in the case so that the bolt holes and probe holes at each end of the case are left uncovered.
- (2) Assemble two probe vanes (1-110) to the case ensuring that the holes in the vanes align the two large probe holes in the case, then assemble a bolted vane (1-100) to abut the probe vane. Check that the vane platform does not protrude beyond the axial joint flange. Insert a bolted vane (1-100) in the other end of the case. Check that the two probe holes and the four bolt holes in the case align their respective vanes.

OVERHAUL

D. Bolt the Half Cases Together and Assemble the Retaining Rings to the Vanes.

- (1) Clean the four axial joint flanges of the two exit guide cases, ensure that both cases are positioned front flange uppermost, then bring the two cases together to abut the axial joint flange.
- (2) Apply lubricant B to six bolts (1-20) then assemble three bolts to the left-hand axial flange and three bolts to the right-hand axial flange. Assemble six slave nuts to the bolts, then tighten them sufficiently to produce a reasonable nip on the flanges.

NOTE: The top and bottom exit guide cases are temporarily bolted together for two specific reasons.

- (a) To facilitate the correct assembly of the two retaining rings and produce a clearance at their axial positions, this is influenced by the bolted vanes when they are finally secured.
  - (b) To obviate the possibility of bolted vane platform protrusion at the axial joint.
- (3) Position a retaining ring (1-60) on the underside of the vanes (top half case) so that the end holes in the retaining ring align the holes in the two bolted vanes. Ensure that the 'L' shaped section of the retaining ring is positioned rearward of the vane inner platform, looking rearwards. Secure the ring with two bolts (1-50) and nuts (1-40) lubricated with lubricant 'B'. Do not tighten at this stage.

NOTE: The flats on the special D-headed bolts are to face inwards (towards the centre) and the bolt heads to face the rear.

- - 
  - 
  - (4) Assemble bolts and nuts lubricated with lubricant 'B' to the remaining 25 positions in the top half retaining ring, nip the nuts but do not tighten at this stage.
- (5) Position a retaining ring (1-60) on the underside of the vane platforms (bottom half case), align the two end holes of the ring with those of the two end bolted vanes, temporarily secure the ring with two bolts (1-50) and two nuts (1-40) lubricated with lubricant 'B'.

SUB-ASSEMBLY

**72-31-02**

Page 504  
Aug 1/75

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (6) Assemble bolts (1-50) and nuts (1-40) lubricated with lubricant 'B' to the remaining 25 positions in the bottom half retaining ring, nip the nuts but do not tighten at this stage.
- (7) Apply lubricant 'B' to the threads of two blanking plugs (1-130) assemble two washers (1-140) to the plugs, then screw the plugs into the provisioned tappings in the bottom half exit guide case.
- (8) Assemble four sleeves (1-80) to four bolts (1-70), apply lubricant 'B' to the bolt threads then assemble the bolts to the two bolted vanes at either end of the bottom half case.
- (9) With the bolted vane retaining bolts loosely assembled, adjust the four bolted vanes to effect a clearance of equal amount between the end faces of the top and bottom retaining rings. When the clearance is obtained tighten the eight bolted vane retaining bolts.

E. Torque-tighten Bolts and Blanking Plugs.

- (1) Torque-tighten the eight bolted vane retaining bolts (1-70) between 160 and 180 lbf in. (18,1 and 20,3 N.m). Wire-lock the bolts to each other.
- (2) Torque-tighten the four blanking plugs (1-130) between 160 and 180 lbf in. (18,1 and 20,3 N.m). Wire-lock the plugs to each other.
- (3) Torque-tighten the 54 retaining ring/vane securing bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m) ensuring that they have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).

F. Separate the Top and Bottom Exit Guide Vane Cases.

- (1) Unscrew and remove the nuts retaining the six temporarily assembled axial bolts (1-20), remove the bolts and place in a container. Separate the two half cases, tie an identification label to the cases, then place on a pallet. Place a protective disk over the exit guide vanes then transfer the cases to the engine final build area.

LP COMPRESSOR ROTOR - SUB-ASSEMBLY

1. General

- A. Prior to commencing the balancing, refer to 72-09-00 Assembly for general information on assembly.
- B. Two methods of balancing are described within this chapter, paras 6 to 12 detail the procedure necessary for horizontal balancing using Avery equipment (72N 17) and paras 13 to 19 detail the procedure necessary for vertical balance using Schenck equipment (ZE.40).
- C. During the balancing procedures, reference will be made to the Illustrated Parts Catalogue (I.P.C.) to identify those items where the nomenclature does not positively identify them, due to the duplication of the titles e.g. blades, disks, spacer rings etc. When an item is part of the breakdown of the text concerned, the item will be identified e.g. as blade (1-180), the 1 referring to the I.P.C. Fig. No., and the 180 referring to the Item No. Where items from a different breakdown are introduced, the breakdown numbers will be quoted in addition e.g. blade (72-33-00/1-180).
- D. Throughout the text special tools are quoted by their Ref. No. e.g. (Tool 1234). For a complete list of tooling required for the mass moment weighing of blades, horizontal and vertical balancing procedures, and for the Manufacturers Part No., refer to Special Tools, Fixtures and Equipment Table 1002, 1003 and 1004 respectively.
- E. This chapter details the work necessary to static balance the individual stages of the rotor to a degree of balance, that will enable the complete LP rotor assembly to be dynamically balanced within the required limits.
- F. All stages of the disks are balanced with the blades assembled, and except for stage 1, the spacer rings are assembled for balancing. The spacer rings are allied to the disk attached to their rear face i.e. stage 1-2 spacer ring to stage 2 disk, stage 2-3 spacer ring to stage 3 disk etc.
- G. The balance of all stages of disks is achieved by the interchange of blades, but in addition, balancing washers can be used on stages 1 to 3 because of the size/weight of the blades. Depending on the condition of the blades, mass moment weighing of the blades may be required.

SUB-ASSEMBLY

**72-31-03**

Page 501  
Mar 1/76

OLYMPUS 593 MK 610-14-28 OVERHAUL  
MANUAL

H. On completion of the balancing, all spacer rings will have been removed from their respective disks, adhesive labels and adhesive residue removed, with a suitable solvent, from the blades. All stages of disks will have their blades assembled, though stages 1 and 2 will not be locked in position. When the balancing is completed the disks/blades and spacer rings must be despatched to the LP compressor assembly (72-31-00 Assembly) for inclusion in the assembly.

2. Mass Moment Weigh the stages 1 to 3 of the LP Compressor Rotor Blades

NOTE: The following procedure need not be carried out on the blades of any stage if all the original blades are undamaged and are to be assembled to the original disk of stage 1 or the original disk/spacer assembly of stages 2 and 3.

BEOL NOTE: To avoid re-etching, note on a blade card the original position number (as etched on the blade root) against the position assembled to in the disc after balancing. This will enable the reassembly of the blades to their correct positions should they come out of the disc after balancing. Applicable to L.P. stage 1-7 rotor assemblies.

A. Prepare the Balancing Machine (Schenck ZE.40) for Mass Moment Weigh of Rotor Blades.

- (1) Assemble the moment weighing adapter for the stage of blades to be weighed (Ref. Table 501) to the drive shaft of the machine (Ref. Fig. 501).

B. Calibrate the Machine.

- (1) Assemble to the blade root block of the adapter a blade of the stage to be weighed, and secure it with the retaining plate and bolt.
- (2) Assemble to the pillar of the adapter the counter-balance weight applicable to the stage of blades to be weighed, and secure the weight with a nut.
- (3) Balance out the tangential component of the mass moment by means of the tangential adjustment weight on the adapter, as follows:
  - (a) Unscrew and remove from the adapter the locking pin for the tangential adjustment weight.
  - (b) Correct the out-of-balance shown on the graticule, by turning the tangential adjustment weight to the left or right as required.
  - (c) On completion of the adjustment, re-insert and fully tighten the locking pin.
  - (d) Operate the machine in a counter-clockwise direction (viewed from above) to check the adjustment. If necessary, repeat the repositioning of the weight until a zero horizontal reading is obtained on the graticule.
- (4) Operate the machine and compensate electrically for the out-of-balance, by adjustment of the vertical and horizontal zeroing potentiometers to give a zero reading of the light spot.
- (5) Move the sliding weight on the adapter arm to the 2 oz in. position and use the calibration potentiometer to obtain a 2 oz in. reading.
- (6) Check the settings of the adapter arm.
  - (a) Position the adapter arm sliding weight at several other oz in. graduations in turn and operate the machine to confirm that the correct readings are shown on the graticule.

SUB-ASSEMBLY

**72-31-03**

Page 505

Dec 1/76

OLYMPUS 593 MK 610-14-28 OVERHAUL  
MANUAL

- (b) In the event of incorrect readings, check that the adapter and arm are secure and that no item is loose and affecting the readings. Check that the spring of the sliding weight is holding the weight in position. If a defect is found, rectify it, then recheck the horizontal and vertical settings and adjust as necessary. Recheck the settings of the adapter arm. If no defects are found, check the balancing machine for malfunction.

C. Carry out Mass Moment Weigh of Rotor Blades.

- (1) Assemble to the blade root block of the adapter a blade of the stage for which the machine has been calibrated, and secure the blade with the retaining plate and bolt.
- (2) Operate the machine and adjust the sliding weight of the adapter arm to give a reading on the graticule when the sensitivity step switch is at its No.1 position.
- (3) Note the oz in. reading on the graticule. Calculate the mass moment weight of the blade to the nearest oz in. by adding (or subtracting) the graticule reading to (or from) the sum of the counterbalance weight and the weight indicated by the position of the sliding weight on the adapter arm. Record the weight of the blade on an adhesive label and attach the label to the (tip) end of the blade.

3. Mass Moment Weigh the Stages 4 to 7 of the LP Compressor Rotor Blades

NOTE: The following procedure need not be carried out on the blades of any stage if all the original blades are undamaged and are to be assembled to the original disk/spacer assembly of stages 4 to 7.

BEOL NOTE: To avoid re-etching, note on a blade card the original position number (as etched on the blade root) against the position assembled to in the disc after balancing. This will enable the reassembly of the blades to their correct positions should they come out of the disc after balancing. Applicable to L.P. Stage 1-7 rotor assemblies.

A. Prepare the (Avery 62N5) Scales for Mass Moment Weigh of Rotor Blades (Ref.Fig.502).

- (1) Ensure that the scale is level.

- (2) Position the locator (Tool 1273) on the end of the adapter arm (Tool 1272) slide, align the holes, then insert the two adapter arm cap screws into the holes in the locator and screw them into the slide.
- (3) Position the adapter arm on the right-hand end of the scale arm and secure with the knurled nut of the scale.
- (4) Release the knurled screw of the slide, position the left-hand edge of the slide at the 10 in. (254 mm) mark. All blades of each stage are to be mass moment weighed with the slide set at this position.

NOTE: Fig.502 does not illustrate the slide in its correct position.

- (5) Select a blade from the stage to be weighed, then position the blade root fir-tree on the locator and adjust on the slide arm to engage on the top of the blade root with the bottom edge of the blade parallel with the (scale) arm. Secure the slide arm, then adjust the locator screw to form a stop for the blade when it is centrally positioned over the scale arm. Secure the locator screw with its thumbnut, then remove the blade.
- (6) Balance out the weight of the adapter arm/locator so that the scale reads zero, by placing weight(s) on the (top) scale pan, and adjusting the position of the screwed balancing weights of the scale.
- (7) Select a (known) weight to counter-balance the weight of the blade and place the weight on the (bottom) scale pan.

B. Carry Out Mass Moment Weigh of Rotor Blades.

- (1) Assemble a blade (of the stage to be weighed) to the locator/arm.

TN45009

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (2) Calculate the mass moment weight of the blade to the nearest tenth oz in. (72 grm mm) by adding the weight indicated on the scale dial to the (known) weight on the (bottom) scale pan.
- (3) Record the weight of the blade on an adhesive label, remove the blade from the locator/arm and attach the label to the (tip) end of the blade. Mass moment weigh each blade in turn in the same manner.
4. Datum Alignment Check of Rotor Disks and Spacer Rings
- A. Check Original and New Rotor Disks and Spacer Rings.
- (1) Examine the edge of each disk and ensure that the datum hole of each disk is marked, and is in correct relationship with the No.1 blade slot (Ref.Fig.503).
- (2) Examine the edge of the front and rear flange of each spacer ring, and ensure that the datum hole in each flange is correctly marked (Ref.Fig.503).
- (3) Trace through the datum holes from the stage 7 disk, stage 6-7 spacer ring, etc. to the stage 1 disk and ensure that the No.1 blades of the disks are in line.
5. Check Balance of Balancing Mandrels Used for Horizontal Balance
- A. General.
- (1) The tolerances of the manufacture of the balancing mandrels are such that concentricity checks etc. are not required on the mandrels, but each mandrel must be dynamically balanced to within 1 dram in. prior to being used as a balancing mandrel. On the first occasion, and on any subsequent occasion it is deemed necessary, the mandrels listed in Table 502 must be balanced in accordance with the following procedure.

- (2) Position the bottom half of the protection guard for the balancing machine in use (Ref. Table 503) in between the cradles so that the left-hand side of the guard is approx. 0.5 in. (12 mm) from the left-hand cradle. Secure the guard to the bed of the balancing machine.
- (3) Assemble bearings to the cradles of the Avery 72N 17 machine.
- (a) Assemble the adjustable bearings (Tool 1154) to the left-hand and right-hand cradles and secure the bearings with keep plates bolted to the cradles.
  - (b) Set the position of the adjustable bearing rollers (if necessary) using the setting gauge (Tool 1641).
    - (i) Set the setting gauge caliper to the bearing journal dia. of the balancing mandrel (Ref.Fig.505) and lock the caliper.
    - (ii) Offer the gauge to the top of the bearing block and ensure that the gauge seats correctly, if necessary, releasing the nuts securing the roller support arms.
    - (iii) Check that the roller contacts the gauge arm, or reposition the roller to contact the arm, then secure the roller support arms.
    - (iv) Reverse the setting gauge in the bearing block and check that the remaining roller contacts the gauge arm, or reposition the roller to contact the arm, then secure the roller support arms. Remove the gauge from the bearing block.

- (v) Screw in on the large tommy bar and engage the plate in the shaft, then continue screwing, holding the knurled ring steady, until the spacer is released.
- (vi) Withdraw the puller and spacer from the shaft. Screw in on the small tommy bar to retract the claws, then withdraw the spacer from the puller.
- (5) Using fine emery cloth, remove the aluminium paint from the rotor shaft at the balancing positions 'A' and 'G' (Ref.Fig.508). Ensure that no paint remains on the shaft at the balancing positions.
- (6) Slide the protector (Tool 408) onto the end of the drive shaft rear, and assemble the (split) protector (Tool 999) to the drive shaft front to protect the splines and labyrinth. Secure the protector with its thumbnut.
3. Carry Out Concentricity and Balancing Checks on the LP Compressor Drive Shaft

- A. Carry Out Concentricity Checks on the Drive Shaft (Ref.Fig.508 and 509).

NOTE: Depending on the availability of equipment, the concentricity checks may be carried out on the balancing machine (prior to balancing) in lieu of the surface table and equipment.

- (1) Prepare the equipment for checking the concentricity.
- (a) Position two supports (Tool 1073) on the surface table.
- (b) Assemble a spacer (Tool 1074) to each of the supports, then assemble clamp plates to each support to secure the spacers.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (c) Assemble the adjustable bearing (Tool 1154) (with the attached arm Tool 1153) to one of the spacers so that the arm is towards the other support. Assemble clamp plates to the spacer to secure the bearing.
- (d) Assemble the other adjustable bearing (Tool 1154) to the remaining spacer then assemble clamp plates to the spacer to secure the bearing.
- (e) Set the position of the adjustable bearing rollers (if necessary) using the setting gauge (Tool 1641) (Ref.Fig.506).
  - (i) Set the setting gauge caliper to the 'A' dia. of the shaft (Ref.Fig.508) and lock the caliper.
  - (ii) Offer the gauge to the top of the bearing block and ensure that the gauge seats correctly, if necessary, releasing the nuts securing the rollers support arms.
  - (iii) Check that the roller contacts the gauge arm, or reposition the roller to contact the arm, then secure the roller support arms.
  - (iv) Reverse the setting gauge in the bearing block and check that the remaining roller contacts the gauge arm, or reposition the roller to contact the arm, then secure the roller support arms. Remove the gauge from the bearing block.
  - (v) Repeat operation (i) to (iv) for diameter 'G' of the shaft.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (2) Carry out a dynamic balancing of the mandrel, operating the balancing machine in accordance with the manufacturers instructions. The mandrel should be rotated at (approx.) 450 rpm and run for approx. 2-3 min for the temperature to stabilise. The balance of the mandrel must be within 1 dram in. If the balance of the mandrel is outside the limits, balance out the right-hand end of the mandrel by slackening the axial grub screws in the end face of the mandrel and removing and/or re-positioning the radial grub screws in the right-hand flange (Ref.Fig.506C),. Re-secure the locking screws after adjustment, balance out the left-hand end by adding plugs ( $\frac{1}{4}$  UNF 28 T.P.I.  $\frac{1}{4}$  in. long) and lockwashers to the studded plate at the left-hand end of the mandrel (Ref.Fig.506).

NOTE: If a new mandrel is seriously out of balance, it may be necessary to correct its static balance first, by grinding the bore of one or more of the lightening holes in the web of the mandrel.

E. Remove the Balance Mandrel from the Balancing Machine.

- (1) If the balancing machine in use is an Avery 7210 release the retaining arm of each cradle and pivot the arms out of the way. With both types of Avery machine release and pivot down the swing bolts securing the top half of the guard, then using a hoist, raise the guard until clear of the mandrel and lower onto a suitable surface. Remove the hoist from the guard.
- (2) Attach a hoist to the lifting fixture (Tool 1162), then position and lower the hoist over the mandrel and engage the two hooks of the fixture around the mandrel. Remove the nuts and washers securing the mandrel to the balancing machine drive. Raise the hoist and guide the mandrel out of the guard, and when possible, disengage the drive from the mandrel studs and lower the drive.

SUB-ASSEMBLY

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (3) Position and lower the mandrel into its storage stand, then remove the fixture from the mandrel and the hoist.

#### 6. Balance the Stage 1 Rotor

NOTE: The stage 1 blades should be received in the container (Tool 1395). Do not remove the blades until they are required for assembly.

##### A. Assemble Blades to Stage 1 Disk (Ref.Fig.507).

- (1) Ensure that a Hydraclamp (Tool 1673) is bolted to the pedestal (Tool 1674), then position the mounting plate (Tool 1163) on the Hydraclamp and secure with its slave bolts. Position the mounting plate so that its axis is horizontal, then lock the Hydraclamp.
- (2) Connect a hoist to the lifting eye of the lifting fixture (Tool 1162), then position the hoist over the static balance mandrel (Tool 1025) and assemble the mandrel to the lifting fixture.
- (3) Position the hoist alongside the mounting plate, then traverse the hoist and engage the balancing mandrel over the mounting plate shaft ensuring that the mandrel studs locate in the holes in the mounting plate. Assemble washers and nuts to the mandrel studs and fully tighten the nuts.
- (4) Position and adjust the support stand (Tool 1667) to support the end of the balancing mandrel. Disconnect the lifting fixture from the mandrel and the fixture from the hoist. Insert the retaining bolt (Tool 1184) into the end of the mandrel and when it contacts the mounting plate, screw it into the plate. Attach a hoist to the shackle of the bolt, then release the Hydraclamp and raise/traverse the hoist to bring the mandrel to the vertical position. Lock the Hydraclamp and release the hoist.
- (5) Assemble the lifting fixture (Tool 401) to the stage 1 disk (Ref.Fig.508).

NOTE: The disk (1-160) should be received in its container (Tool 1409).

- (5) Assemble the lifting fixture (Tool 401) to the stage 1 disk (Ref.Fig.508).

NOTE: The disk (1-160) should be received in its container (Tool 1409).

- (a) Attach a hoist to the lifting fixture plate of the lifting fixture, then position the hoist over the disk (1-160).
- (b) Unscrew and remove the knurled nut and clamp plate from the disk container.
- (c) Ensure that the pins of the hand knobs are located in the holes at the 'FREE' position, then lower the hoist and engage the end plate of the fixture in the disk. Withdraw the pins of the hand knobs from the 'FREE' position locating holes, turn the knobs to the 'LOCK' position engaging the lugs under the disk, and ensure that the pins locate in the locating holes.
- (6) Assemble the stage 1 disk to the balancing mandrel (Ref.Fig.508).
- (a) Raise the hoist and position the disk over the balancing mandrel.
- (b) Correctly position the disk relative to the mandrel locating/securing studs, then lower the disk over the studs, ensuring that it is lowered squarely and does not get jammed. Lightly tap with a suitable (soft-faced) mallet (if necessary). When the disk abuts the mandrel, screw the special nuts onto the studs and fully tighten the nuts.
- (c) Withdraw the pins of the hand knobs from the 'LOCK' position locating holes, turn the knobs to the 'FREE' position, and ensure that the pins locate in the locating holes. Raise the fixture from the disk and lower the fixture onto a suitable surface, then release the hoist.
- (7) Attach a hoist to the shackle of the retaining bolt, then release the Hydraclamp and lower the mandrel to the horizontal position. Position the support stand (Tool 1667) under the end of the mandrel to take the weight, then remove the hoist and unscrew and remove the retaining bolt.

SNECMA

- (8) Assemble balancing weights to the stage 1 disk (Ref.Fig.509).
- (a) Apply lubricant 'B' to bolts (1-140), then insert the bolts into the outer ring of holes in the disk, and assemble a balancing weight (1-120) and nut (1-110) to each bolt. Ensure that each nut has a minimum locking (run down) torque of 3.5 lbf in. (0,4 N.m), then torque-tighten the nuts between 85 and 95 lbf in. (9,6 and 10,7 N.m).
  - (b) After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 1.5 thread pitches beyond nut chamfer, the bolt must be renewed (Ref.SB.72-8449-191).
- (9) Assemble the blades to the stage 1 disk (Ref.Fig.509).
- NOTE: Ensure the complete set of blades used are to the standard of SB.72-8787-300.
- NOTE: If all the original blades are available and undamaged then assemble the blades as detailed in para.(a). If the blades include 3 repaired and/or new blades, then the blades must be assembled as detailed in para.(b). If the blades include more than 3 repaired and/or new blades then the blades must be assembled as detailed in para.(c). Ensure that the aggregate blending depth of repaired blades does not exceed 3.600 in. (91,44 mm) (Ref. 72-31-03 Repair No.6).
- (a) Identify the stage 1 blades (1-150), then examine the blade roots for their positional No. (Ref. Fig.503) and lay the blades out in numerical sequence. Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades. Ensure that the special nuts securing the mandrel retaining plate are loose, and the plate is positioned to allow the blades to be assembled. Insert the blades in numerical sequence into the rear of the disk starting at No.1 position and working in a clockwise direction when viewing the mandrel (rear) side of the disk. When the blades are assembled, turn the mandrel retaining plate to secure the blades, then tighten the plate special nuts.

- (b) Identify the stage 1 blades (1-150) then examine the roots of the original blades for their positional No. (Ref.Fig.503) and lay the blades out in numerical sequence, leaving spaces where the new blades are to be positioned. Noting the mass moment weight of the new blades, place the lightest new blades in vacant positions next to the heaviest original blades and position the heaviest new blades in vacant positions next to the lightest original blades. Assemble the blades to the disk as detailed in para.(a).
- (c) Identify the stage 1 blades (1-150), then according to the mass moment weight of the blades (quoted on the labels), lay the blades out in sequence of weight, starting with the heaviest blade at one end and ending with the lightest blade at the other end. Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades (Ref.Fig.503). Ensure that the special nuts securing the mandrel retaining plate are loose, and the plate is positioned to allow the blades to be assembled. Assemble the blades to the rear of the disk positioning the heaviest blade at No.1 position and the next heaviest blade diametrically opposite, then assemble the two lightest blades diametrically opposite each other and next to the heaviest blades. Assemble the remainder of the blades to the disk in sequence of weight, assembling alternate pairs of heavy and light blades and where possible, positioning equal weight blades opposite each other. When the blades are assembled, turn the mandrel retaining plate to secure the blades, then tighten the plate special nuts.

B. Assemble the Stage 1 Bladed Disk to the Balancing Machine.

- (1) Prepare the balancing machine (Avery 72 N 17 (Ref. Fig.504)).

TN11548

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (a) Ensure that the adjustable bearings (Tool 1154) are assembled and secured with keep plates to left-hand and right-hand cradles of the balancing machine, and that the bearings are correctly set (Ref. para. 5.B. (3) (c)).
- (b) Ensure that the protection guard (Tool 1303) is bolted to the bed of the machine.
- (2) Attach a hoist to the lifting eye of the lifting fixture (Tool 1162), then position the hoist over the balance mandrel and engage the two hooks of the fixture around the mandrel.
- (3) Remove the nuts and washers securing the mandrel to the mounting plate, then remove the support stand and traverse the hoist to disengage the mandrel from the mounting plate. If the mandrel/disk cannot be assembled direct to the balancing machine, lower it into the mobile stand (Tool 1165) engaging the mandrel journals in the stand support brackets (Ref. Fig. 510). Disconnect the lifting fixture, then position the stand near the balancing machine. With the lifting fixture (Tool 1162) attached to a hoist, position the hooks of the fixture around the mandrel and raise it out of the stand.
- (4) Position the hoist over the balancing machine with the studded end of the mandrel towards the balancing machine drive. Lower the disk into the bottom half of the protection guard, then lift the balancing machine drive and engage the mandrel studs in it. Adjust the position of the cradles (if necessary) to align with the bearing journals of the mandrel, with the mandrel correctly engaged with the drive. Adjust the position of the guard (if necessary) to give running clearance for the mandrel/bladed disk, then secure the cradles and guard (if required). Lower the mandrel onto the cradles, then disengage the lifting fixture from the mandrel and the hoist.
- (5) Assemble washers and nuts to the mandrel studs and fully tighten the nuts.

SUB-ASSEMBLY

OVERHAUL

- (6) Using a hoist, lower the top half of the guard onto the bottom half ensuring that the access cover of the guard is towards the balancing machine operator. Pivot the bottom guard securing bolts into the top guard and secure with the thumbnuts.

C. Balance the Stage 1 Bladed Disk.

- (1) Apply lubricant 'A' to the spindle of the adjustable bearings and the journals of the mandrel, and ensure that they remain well lubricated throughout the balancing operation.
- (2) Carry out a static balance of the bladed disk, operating the balancing machine in accordance with the manufacturers instructions. The disk should be rotated at (approx.) 450 rpm and run for (approx.) 2 to 3 minutes for the temperature to stabilise. The balance of the disk must be within 4 drmm in. (180 grm mm). If the balance of the disk is outside the limit, rectify by the interchange of heavy and light-weight blades (Ref.para.(3)), and the interchange of heavy and light-weight balancing weights (Ref.para.(4)) from the out of balance angular position, until the disk is within limits.
- (3) Gain access to the blades by either hinging open the access cover, or releasing and removing the top half of the guard using a hoist. Release the special nuts securing the mandrel retaining plate, then turn the plate to allow the removal of the blades. Withdraw a heavy blade from as near the out of balance position as possible, and exchange it for a light blade from as near diametrically opposite as possible. Turn the mandrel retaining plate to secure the blades, then tighten the special nuts to lock the plate. Hinge close the guard access cover, or replace and secure the top of the guard.

NOTE: If the blades are the original and labels stating the mass moment weight are not attached to the blades, two or three of the blades, from the out of balance position, must be removed (noting their positions) and weighed (Ref.para.2.), as must blades

PRINTED IN ENGLAND

OVERHAUL'

from the diametrically opposite position. The suitable weight blades must be exchanged, and the remainder replaced in their original positions. A note of the weight and position of the removed blades should be kept for possible further exchange of blades.

- (4) If, after exchanges of blades, it is found that the balance cannot be brought within the limits (due to the size/weight of the blades), the balancing weights must be changed. Hinge open the guard access cover, release and remove a (light-weight) balancing weight (1-120) from the front of the disk at the out-of-balance position, then assemble a (heavier weight) balancing weight, (either 1-125 or 1-130) to the bolt. Lubricate the nut (1-110) with lubricant 'B', then screw it onto the bolt, ensure that it has a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) and torque-tighten the nut between 85 and 95 lbf in. (9,6 and 10,7 N.m). The max number of heavy balancing weights that can be used is 4 off (1-125) and 6 off (1-130).

D. Remove the Bladed Disk from the Balancing Machine and Number the Blades.

- (1) Release and pivot down the swing bolts securing the top half of the guard, then using a hoist, raise the guard until clear of the disk and lower onto a suitable surface. Remove the hoist from the guard.
- (2) Attach a hoist to the lifting fixture (Tool 1162), then position and lower the hoist over the disk and engage the two hooks of the fixture around the mandrel. Remove the nuts and washers securing the mandrel to the balancing machine drive. Raise the hoist and guide the disk out of the machine, and when possible, disengage the drive from the mandrel studs and lower the drive.

TN11975

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (3) If the mandrel/disk cannot be assembled direct to the Hydraclamp, lower it into the mobile stand (Tool 1165) engaging the mandrel journals in the stand support brackets (Ref.Fig.510). Disconnect the lifting fixture, then position the stand by the Hydraclamp. With the lifting fixture (Tool 1162) attached to a hoist, position the hooks of the fixture around the mandrel and raise it out of the stand.
- (4) Place a protection/retaining band (Tool 1123) around the Hydraclamp pedestal. Position the hoist alongside the Hydraclamp, then engage the mandrel over the mounting plate shaft and insert the studs through the plate. Assemble the washers and nuts to the studs and fully tighten the nuts.
- (5) Position the support stand (Tool 1667) under the end of the mandrel, then disconnect the lifting fixture from the mandrel and the fixture from the hoist. Insert the retaining bolt (Tool 1184) into the end of the mandrel and screw it into the mounting plate.
- (6) Release the special nuts securing the mandrel retaining plate, then turn the plate to allow the removal of the blades. Examine the edge of the disk for the No.1 blade datum mark  $\rightarrow 0$ , then examine the blade roots for their numbering (Ref.Fig.503). Ensure that all the blades are numbered correctly in numerical sequence in a clockwise direction as viewed from the mandrel (rear) side of the disk, with No.1 blade in the datum slot. Etch all new blades with their position No., and renumber any blades that have been re-positioned, ensuring that all old position No. are obliterated. Turn the retaining plate to secure the blades, then tighten the retaining plate special nuts. Assemble the protection/retaining band (Tool 1123) to the blade tips.

OVERHAUL

E. Remove the Bladed Disk from the Balancing Mandrel (Ref.Fig.511).

- (1) Attach a hoist to the ring of the retaining bolt, then release the Hydraclamp and raise/traverse the hoist to position the mandrel vertically. Lock the Hydraclamp, then release the hoist.
- (2) Assemble the lifting fixture (Tool 401) to the stage 1 disk (Ref.Fig.508).
  - (a) Attach a hoist to the lifting plate of the lifting fixture, then position the hoist over the disk.
  - (b) Ensure that the pins of the hand knobs are located in the holes at the 'FREE' position, then lower the hoist and engage the end plate of the fixture in the disk. Withdraw the pins of the hand knobs from the 'FREE' position locating holes, turn the knobs to the 'LOCK' position, and ensure that the pins locate in the locating holes.
- (3) Release and remove the mandrel special nuts securing the disk. Screw the four extractor bolts (Tool 1185) into the tapped holes in the balancing mandrel plate (from underneath) until they contact the disk, then screw the bolts in, in equal progressive increments until the disk is released from the mandrel locating/securing studs. If there is any evidence that the blades are slipping or may slip out of the disk, assemble blade retainers (Tool 1166) to each pair of blades and pull the retainers towards the tips of the blades. Raise the hoist, then position and lower the disk onto a suitable clean flat surface.
- (4) Withdraw the pins of the hand knobs from the 'LOCK' position locating holes, turn the knobs to the 'FREE' position, and ensure that the pins locate in the locating holes. Raise the fixture from the disk and lower the fixture onto a suitable surface, then release the hoist.

PRINTED IN ENGLAND

TN11978

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (5) Remove the balancing mandrel from the mounting plate (Ref.Fig.507).
  - (a) Attach a hoist to the ring of the retaining bolt, release the Hydraclamp, then lower the mandrel onto the support stand. Release the hoist then remove the retaining bolt. Remove the extractor bolts from the mandrel plate.
  - (b) Attach a hoist to the lifting eye of the lifting fixture (Tool 1162), then position the hoist over the balancing mandrel and engage the two hooks around the mandrel.
  - (c) Remove the nuts and washers securing the mandrel to the mounting plate, then remove the support stand and traverse the hoist to disengage the mandrel from the mounting plate. Position and lower the mandrel into its storage stand, then remove the lifting fixture from the mandrel and the hoist. Assemble the washers and nuts to the mandrel studs, and the special nuts to the mandrel locating/securing studs.

F. Check the Stage 1 Blade Tang Clearances.

- (1) Invert the disk so that its rear face is uppermost, and rest the disk on the centre support (Tool 1326). Remove the protection/retaining band from the blade tips, and the blade retainers (if assembled).
- (2) Examine the edge of the disk and identify the datum hole by the datum mark  $\rightarrow 0$ , then examine the stage 1-2 spacer ring (1-190) and identify the datum hole by the datum mark  $\rightarrow 0$  on the edge of the flange (Ref.Fig.503). Release and remove the protector (Tool 443) (if assembled) from the spacer ring, then place the spacer ring on the disk aligning the datum holes, and ensure that the spacer abuts the disk.
- (3) Using feeler gauges, check that there is a clearance between each blade tang and the spacer ring of between 0.002 and 0.008 in. (0,05 and 0,20 mm).

TN17440

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (4) Remove the spacer ring from the disk, assemble the protector (Tool 443) to the spacer, then stow the spacer on the top shelf of the container (Tool 1410). Place the protection/retaining band (Tool 1123) around the tips of the blade, then invert the disk and place on a pallet. Use the lifting fixture (Tool 401) (if required) to place it on the pallet.

NOTE: The stage 1 bladed disk is now ready to be passed to the LP Compressor Assembly (72-31-00 Assembly).

#### 7. Balance the Stage 2 Rotor and Stage 1-2 Spacer Ring

NOTE: The stage 2 blades should be received in the container (Tool 1396). Do not remove the blades until they are required for assembly.

##### A. Assemble the Stage 1-2 Spacer Ring to the Stage 2 Disk.

NOTE: The disk (1-250) should be received in its container (Tool 1407).

- (1) Unscrew and remove the knurled nut and clamp plate from the disk container.
- (2) Attach the multiple leg sling (Tool 1285) to a hoist and position the hoist above the disk.
- (3) Unscrew and remove the three nuts and washers from the waisted bolts of the sling then pass the bolts through holes in the disk. Reassemble the washers and nuts to the bolts to secure the disk to the sling.
- (4) Raise the hoist and position the disk on suitable blocks or support (Tool 1326), the front face of the disk should now be uppermost.
- (5) Unscrew the nuts from the waisted bolts of the sling, raise the hoist and remove the sling from the disk.
- (6) Examine the front face of the disk at the blade root position, and identify the datum hole by the datum mark  $\rightarrow 0$  to each side of No.1 blade slot. Remove the spacer ring (1-190) from the container (Tool 1410) (top shelf), examine the spacer ring and identify the datum hole by the datum mark  $\rightarrow 00 \leftarrow$  on the edge of the flange (Ref.Fig.503). Place the spacer ring on the disk aligning the datum holes.

OVERHAUL

- (7) Insert the four slave bolts (Tool 366) into the bolt holes from underneath the disk, ensuring that they are evenly spaced, then assemble a slave washer and nut to each bolt (Ref.Fig.512). Fully tighten the nuts.

B. Assemble the Stage 2 Disk/Spacer Ring to the Balancing Mandrel.

- (1) Ensure that the Hydraclamp (Tool 1673) is bolted to the pedestal (Tool 1674) and the mounting plate (Tool 1163) is bolted to the Hydraclamp. Position the mounting plate so that its axis is horizontal, then lock the Hydraclamp.
- (2) Assemble the balancing mandrel to the mounting plate (Ref.Fig.507).
  - (a) Attach a hoist to the lifting eye of the Lifting fixture (Tool 1162), then position the fixture over the balancing mandrel (Tool 600) and engage the two hooks of the fixture around the mandrel.
  - (b) Position the hoist alongside the mounting plate, then traverse the hoist and engage the balancing mandrel over the mounting plate shaft ensuring that the mandrel studs locate in the holes in the mounting plate. Assemble washers and nuts to the mandrel studs and fully tighten the nuts.
  - (c) Position and adjust the support stand (Tool 1667) to support the end of the mandrel. Disconnect the lifting fixture from the mandrel and the hoist. Insert the retaining bolt (Tool 1184) into the end of the mandrel and screw it into the mounting plate.
  - (d) Attach a hoist to the shackle of the retaining bolt, then release the Hydraclamp and raise/traverse the hoist to bring the mandrel to the vertical position. Lock the Hydraclamp and release the hoist.
- (3) Assemble the lifting fixture (Tool 364) to the stage 1-2 spacer ring (Ref.Fig.512).
  - (a) Attach a hoist to the lifting ring of the lifting fixture, then position the hoist over the spacer.

SUB-ASSEMBLY

OVERHAUL

(b) Ensure that the pins of the hand knobs are located in the holes at the 'FREE' position, then lower the hoist and engage the locating plate of the fixture in the spacer. Withdraw the pins of the hand knobs from the 'FREE' position locating holes, turn the knobs to the 'LOCK' position engaging the claws under the spacer flange, and ensure that the pins locate in the locating holes.

- (4) Position the disk over the balancing mandrel and align the four slave bolts in the disk with the recesses in the mandrel plate. Lower the disk/spacer over the mandrel locating/securing studs, ensuring that it is lowered squarely and does not get jammed. Lightly tap with a suitable (soft faced) mallet (if necessary). When the disk abuts the mandrel, screw the special nuts onto the studs and fully tighten the nuts.
- (5) Withdraw the pins of the hand knobs from the 'LOCK' position locating holes, turn the knobs to the 'FREE' position, and ensure that the pins locate in the locating holes. Raise the fixture from the spacer ring and lower the fixture onto a suitable surface, then release the hoist.
- (6) Attach a hoist to the shackle of the retaining bolt, then release the Hydraclamp and lower the mandrel to the horizontal position. Position the support stand (Tool 1667) under the end of the mandrel to take the weight, then remove the hoist and unscrew and remove the retaining bolt.

C. Assemble the Blades to Stage 2 Disk (Ref.Fig.513).

NOTE: If all the original blades are available and undamaged then assemble the blades as detailed in para.(1). If the blades include 4 repaired and/or new blades, then the blades must be assembled as detailed in para.(2). If the blades include more than 4 repaired and/or new blades then the blades must be assembled as detailed in para.(3). Ensure that the aggregate blending depth of repaired blades does not exceed 3.600 in. (91,44 mm) (Ref. 72-31-03 Repair No.6).

NOTE: Blades with undercut roots (SB 72-8934-356 standard) must be assembled in stage sets.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (1) Identify the stage 2 blades (1-240), then examine the blade roots for their positional No. (Ref.Fig.503) and lay the blades out in numerical sequence. Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades. Ensure that the special nuts securing the mandrel retaining plate are loose, and the plate is positioned to allow the blades to be assembled. Insert the blades in numerical sequence into the rear of the disk starting at No.1 position, and working in a clockwise direction when viewing the mandrel (rear) side of the disk. When the blades are assembled, turn the mandrel retaining plate to secure the blades, then tighten the plate special nuts.
- (2) Identify the stage 2 blades (1-240) then examine the roots of the original blades for their positional No. (Ref.Fig.503) and lay the blades out in numerical sequence, leaving spaces where new blades are to be positioned. Noting the mass moment weight of the new blades, place the lightest new blades in vacant positions next to the heaviest original blades and position the heaviest new blades in vacant positions next to the lightest original blades. Assemble the blades to the disk as detailed in para.(1).
- (3) Identify the stage 2 blades (1-240), then according to the mass moment weight of the blades (quoted on the labels), lay the blades out in sequence of weight, starting with the heaviest blade at one end and ending with the lightest blade at the other end. Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades. Ensure that the special nuts securing the mandrel retaining plate are loose, and the plate is positioned to allow the blades to be assembled. Assemble the blades to the rear of the disk positioning the heaviest blade at No.1 position and the next heaviest blade diametrically opposite, then assemble the two lightest blades diametrically opposite each other and next to the heaviest blades. Assemble the remainder of the blades to the disk in sequence of weight, assembling alternate pairs of heavy and light blades and where possible, positioning equal weight blades diametrically opposite each other. When the blades are assembled, turn the mandrel retaining plate to secure the blades, then tighten the plate special nuts.

SUB-ASSEMBLY

OVERHAUL

D. Assemble the Stage 2 Bladed Disk/Spacer Ring to the Balancing Machine (Avery 72 N 17).

- (1) Prepare the balancing machine (Avery 72 N 17) (Ref. Fig.504).
  - (a) Ensure that the adjustable bearings (Tool 1154) are assembled and secured with keep plates to the left-hand and the right-hand cradles of the balancing machine, and that the bearings are correctly set (Ref. para.5.B.(3)(c)).
  - (b) Ensure that the protection guard (Tool 1303) is bolted to the bed of the machine.
- (2) Attach a hoist to the lifting eye of the lifting fixture (Tool 1162), then position the hoist over the balancing mandrel and engage the two hooks of the fixture around the mandrel.
- (3) Remove the nuts securing the mandrel to the mounting plate, then remove the support stand and traverse the hoist to disengage the mandrel from the mounting plate. If the mandrel/disk cannot be assembled direct to the balancing machine, lower it into the mobile stand (Tool 1165) engaging the mandrel journals in the stand support brackets. Disconnect the lifting fixture, then position the stand near the balancing machine. With the lifting fixture (Tool 1162) attached to a hoist, position the hooks of the fixture around the mandrel and raise it out of the stand.
- (4) Position the hoist over the balancing machine with the studded end of the mandrel towards the balancing machine drive. Lower the disk into the bottom half of the protection guard, lift the balancing machine drive and engage the mandrel studs in it. Adjust the position of the cradles (if necessary) to align with the bearing journals of the mandrel, with the mandrel correctly engaged with the drive. Adjust the guard position (if necessary) to give running clearance of the mandrel/bladed disk, then secure the cradles and guard (if required). Lower the mandrel onto the cradles, then disengage the lifting fixture from the mandrel and the hoist.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (5) Assemble washers and nuts to the mandrel studs and fully tighten the nuts.
- (6) Using a hoist, lower the top half of the guard onto the bottom half ensuring that the access cover of the guard is towards the balancing machine operator. Pivot the bottom guard swing bolts into the top guard and secure with the thumbnuts.

E. Balance the Stage 2 Bladed Disk/Spacer Ring.

- (1) Apply lubricant 'A' to the spindles of the adjustable bearings and the journals of the mandrel, and ensure that they remain well lubricated throughout the balancing operation.
- (2) Carry out a static balance of the bladed disk, operating the balancing machine in accordance with the manufacturers instructions. The disk should be rotated at (approx.) 450 rpm and run for (approx.) two to three min. for the temperature to stabilise. The balance of the disk must be within 4 drn in. (180 grm mm). If the balance of the disk is outside the limits, rectify by the interchange of heavy and light-weight blades (Ref.para.(3)) and (if necessary) by the addition of balancing weights (Ref.para.(4)) to the out of balance angular position, until the disk is within limits.
- (3) Gain access to the blades by either hinging open the access cover, or releasing and removing the top half of the guard using a hoist. Release the special nuts securing the mandrel retaining plate, then turn the plate to allow the removal of the blades. Withdraw a heavy blade from as near the out of balance position as possible, and exchange it for a light blade from as near diametrically opposite as possible. Turn the mandrel retaining plate to secure the blades, then tighten the special nuts to lock the plate. Hinge close the guard access cover, or replace and secure the top of the guard, then recheck the balance.

NOTE: If the blades are the original and labels stating the mass moment weight are not attached to

OVERHAUL

sneema

the blades, two or three of the blades, from the out of balance position must be removed (noting their positions) and weighed (Ref. para. 2), as must blades from the diametrically opposite position. The suitable weight blades must be exchanged, and the remainder replaced in their original positions. A note of the weight and position of the removed blades should be kept for possible further exchange of blades.

- (4) If after exchanges of blades, it is found that the balance cannot be brought within the limits (due to the size/weight of the blades), balancing weights must be added. Hinge open the guard access cover. Apply lubricant 'B' to the bolt (1-230), then insert the bolt into the bolt hole in the disk at the out of balance position and assemble a balance weight, (1-210, 1-215 or 1-220) and a nut (1-200) to the bolt. Ensure that the nut has a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m), then torque-tighten the nut between 85 and 95 lbf in. (9,6 and 10,7 N.m). After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 1.5 thread pitches beyond nut chamfer, the bolt must be renewed (Ref. SB.72-8449-191). Hinge close the access cover, then recheck the balance. Exchange or add balancing weights until the balance is within four drn. in. The max. number of balancing weights, of any one weight or combination of weights that can be assembled to the disk is four.

F. Remove the Bladed Disk/Spacer Ring from the Balancing Machine and Number the Blades.

- (1) Release and pivot down the swing bolts securing the top half of the guard, then using a hoist, raise the guard until clear of the disk and lower onto a suitable surface. Remove the hoist from the guard.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (2) Attach a hoist to the lifting fixture (Tool 1162), then position and lower the hoist over the disk and engage the two hooks of the fixture around the mandrel. Remove the nuts and washers securing the mandrel to the balancing machine drive. Raise the hoist and guide the disk out of the machine, and when possible, disengage the drive from the mandrel studs and lower the drive.
- (3) If the mandrel/disk cannot be assembled direct to the Hydraclamp, lower it into the mobile stand (Tool 1165) engaging the mandrel journals in the stand support brackets. Disconnect the lifting fixture, then position the stand by the Hydraclamp. With the lifting fixture (Tool 1162) attached to a hoist, position the hooks of the fixture around the mandrel and raise it out of the stand.
- (4) Position the hoist alongside the Hydraclamp, then engage the mandrel over the mounting plate and insert the studs through the plate. Assemble the mandrel washers and nuts to the studs and fully tighten the nuts.
- (5) Position the support stand (Tool 1667) under the end of the mandrel, then disconnect the lifting fixture from the mandrel and the fixture from the hoist. Insert the retaining bolt (Tool 1184) into the end of the mandrel and screw it into the mounting plate.
- (6) Release the special nuts securing the mandrel retaining plate, then turn the plate to allow the removal of the blades. Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades then examine the blade roots for their numbering (Ref.Fig.503). Ensure that all the blades are numbered correctly in numerical sequence in a clockwise direction as viewed from the mandrel (rear) side of the disk, with No.1 blade in the datum slot. Etch all new blades with their position No., and renumber any blades that have been re-positioned, ensuring that all old position No. are obliterated. Turn the mandrel retaining plate to secure the blades.

OVERHAUL

G. Remove the Stage 1-2 Spacer Ring from the Stage 2 Disk.

- (1) Attach a hoist to the shackle of the retaining bolt, then release the Hydraclamp and raise/traverse the hoist to position the mandrel vertically. Lock the Hydraclamp, then release the hoist.
- (2) Assemble the protection/retaining band (Tool 1124) around the blade tips. Assemble the two halves of the protector (Tool 443) around the labyrinth of the spacer ring, then secure the two halves together with the clamp screws. Remove the special nuts securing the disk/spacer to the balancing mandrel.
- (3) Assemble the lifting fixture (Tool 364) to the stage 1-2 spacer ring (Ref.Fig.512).
  - (a) Attach a hoist to the lifting ring of the lifting fixture, then position the hoist over the spacer.
  - (b) Ensure that the pins of the hand knobs are located in the holes at the 'FREE' position, then lower the hoist and engage the locating plate of the fixture in the spacer. Withdraw the pins of the hand knobs from the 'FREE' position locating holes, turn the knobs to the 'LOCK' position engaging the claws under the spacer flange, and ensure that the pins locate in the locating holes.
- (4) Screw the four extractor bolts (Tool 1185) into the tapped holes in the balancing mandrel plate (from underneath) until they contact the disk. Screw the extractor bolts in in equal progressive increments until the disk is released from the mandrel locating/securing studs. If there is any evidence that the blades are slipping or may do so, assemble the blade retainers (Tool 1166) to each pair of blades and pull the retainers towards the tips of the blades. Raise the hoist, then position and lower the disk onto a suitable clean flat surface.

- (5) Withdraw the pins of the hand knobs from the 'LOCK' position locating holes, turn the knobs to the 'FREE' position, and ensure that the pins locate in the locating holes. Raise the fixture from the spacer and lower onto a suitable surface, then release the hoist.
  - (6) Remove the slave nuts, then remove the spacer ring from the disk and stow the spacer on the top shelf of the container (Tool 1410).
  - (7) Remove the balancing mandrel from the mounting plate (Ref.Fig.507).
    - (a) Attach a hoist to the shackle of the retaining bolt, release the Hydraclamp, then lower the mandrel onto the support stand (Tool 1667). Release the hoist then remove the retaining bolt. Remove the extractor bolts from the plate of the mandrel.
    - (b) Attach a hoist to the lifting eye of the lifting fixture (Tool 1162) then position the hoist over the balancing mandrel and engage the two hooks of the fixture around the mandrel.
    - (c) Remove the nuts and washers securing the mandrel to the mounting plate, then remove the support stand and traverse the hoist to disengage the mandrel from the mounting plate. Position and lower the mandrel onto its storage stand, then remove the lifting fixture from the hoist and the mandrel. Assemble the washers and nuts to the mandrel studs, and the special nuts to the mandrel locating/securing studs.
- H. Check the Stage 2 Blade Tang Clearances.
- (1) Invert the disk so that its rear face is uppermost, and rest the disk on the centre support (Tool 1326). Remove the protection/retaining band from the blade tips, and the blade retainers (if assembled).

PRINTED IN ENGLAND

- (2) Examine the front face of the disk at the blade root position, and identify the datum hole by the datum mark  $\rightarrow 00 \leftarrow$  to each side of No.1 blade slot, then examine the stage 2-3 spacer ring (1-280) and identify the datum hole by the datum mark  $\rightarrow 00 \leftarrow$  on the edge of the flange (Ref.Fig.503). Release and remove the protector (Tool 1167) (if assembled) from the spacer ring, then place the spacer ring on the disk aligning the datum holes, and ensure that the spacer abuts the disk.
- (3) Using feeler gauges, check that there is a clearance between each blade tang and the spacer ring between 0.002 and 0.008 in. (0.05 and 0.20 mm).
- (4) Remove the spacer ring from the disk, assemble the protector (Tool 1167) to the spacer, then stow the spacer on the middle shelf of the container (Tool 1410). Place the protection/retaining band (Tool 1124) around the tips of the blades, then invert the disk and place on a pallet. Use the multiple leg sling (Tool 1285) (if required) to place it on the pallet.

NOTE: The stage 2 bladed disk and stage 1-2 spacer ring are now ready to be passed to the LP Compressor Assembly (72-31-00 Assembly).

#### 8. Balance the Stage 3 Rotor and Stage 2-3 Spacer Ring

NOTE: The stage 3 blades should be received in the container (Tool 1397). Do not remove the blades until they are required for assembly.

##### A. Assemble the Stage 2-3 Spacer Ring to the Stage 3 Disk.

NOTE: The disk (1-360) should be received in the container (Tool 1408).

- (1) Unscrew and remove the knurled nut and clamp plate from the disk container.
- (2) Attach the multiple leg sling (Tool 1217) to a hoist and position the hoist above the disk.
- (3) Assemble the four slave bolts (Tool 367) to the disk, the bolts, inserted from the rear face, should be equi-spaced with one assembled to the datum hole marked  $\rightarrow 00 \leftarrow$ .

TN11783

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (4) Lower the sling to the disk and screw the larger thumbnuts on to the slave bolts.
  - (5) Raise the hoist and place the disk on suitable blocks or support (Tool 1326) with the front of the disk uppermost, unscrew the thumbnuts then raise the hoist to remove the sling.
  - (6) Examine the front face of the disk at the blade root position, and identify the datum hole by the datum marks  $\rightarrow 00 \leftarrow$  to each side of No.1 blade slot. Remove the spacer ring (1-280) from the container (Tool 1410) and identify the datum hole by the datum mark  $\rightarrow 00 \leftarrow$  on the edge of the flange (Ref.Fig.503). Place the spacer ring on the disk aligning the datum holes.
  - (7) Assemble a slave washer and nut to each of the slave bolts (Ref.Fig.514) and fully tighten the nuts.
- B. Assemble the Stage 3 Disk/Spacer Ring to the Balancing Mandrel.
- (1) Ensure that the Hydraclamp (Tool 1673) is bolted to the pedestal (Tool 1674) and the mounting plate (Tool 1163) is bolted to the Hydraclamp. Position the mounting plate with its axis horizontal, then lock the Hydraclamp.
  - (2) Assemble the balancing mandrel (Tool 379) to the mounting plate (Ref.Fig.507).
    - (a) Attach a hoist to the lifting eye of the lifting fixture (Tool 1162), then position the fixture over the balancing mandrel and engage the two hooks of the fixture around the mandrel.
    - (b) Position the hoist alongside the mounting plate, then traverse the hoist and engage the balancing mandrel over the mounting plate shaft, ensuring that the mandrel studs locate in the holes in the mounting plate. Assemble washers and nuts to the mandrel studs and fully tighten the nuts.

OVERHAUL

- (c) Position and adjust the support stand (Tool 1667) to support the end of the mandrel. Disconnect the lifting fixture from the mandrel and the hoist. Insert the retaining bolt (Tool 1184) into the end of the mandrel and screw it into the mounting plate. Attach a hoist to the shackle of the bolt, then release the Hydraclamp and raise/traverse the hoist to bring the mandrel to the vertical position. Lock the Hydraclamp, then release the hoist.
- (3) Assemble the lifting fixture (Tool 365) to the stage 2-3 spacer ring (Ref.Fig.514).
- (a) Attach a hoist to the lifting ring of the lifting fixture, then position the hoist over the spacer.
- (b) Ensure that the pins of the hand knobs are located in the holes at the 'FREE' position, then lower the hoist and engage the locating plate of the fixture in the spacer. Withdraw the pins of the hand knobs from the 'FREE' position locating holes, turn the knobs to the 'LOCK' position engaging the claws under the spacer flange, and ensure that the pins locate in the locating holes.
- (4) Position the disk over the balancing mandrel and align the four slave bolts in the disk with the recesses in the mandrel plate. Lower the disk/spacer over the mandrel locating/securing studs, ensuring that it is lowered squarely and does not get jammed. Lightly tap with a suitable (soft faced) mallet (if required). When the disk abuts the mandrel, screw the special nuts onto the studs and fully tighten the nuts.

- (5) Withdraw the pins of the hand knobs from the 'LOCK' position locating holes, turn the knobs to the 'FREE' position, and ensure that the pins locate in the locating holes. Raise the fixture from the spacer ring and lower the fixture onto a suitable surface, then release the hoist.
- (6) Attach a hoist to the shackle of the retaining bolt, then release the Hydraclamp and lower the mandrel to the horizontal position. Position the support stand (Tool 1667) under the end of the mandrel to take the weight, then remove the hoist and unscrew and remove the retaining bolt.

C. Assemble the Blades to Stage 3 Disk (Ref.Fig.515).

NOTE: If all the original blades are available and undamaged then assemble the blades as detailed in para.(1). If the blades include 4 repaired and/or new blades, then the blades must be assembled as detailed in para.(2). If the blades include more than 4 repaired and/or new blades then the blades must be assembled as detailed in para.(3). Ensure that the aggregate blending depth of repaired blades does not exceed 3.200 in. (81,28 mm) (Ref.72-31-03 Repair No.6).

NOTE: The preceding information regarding repaired or new blades also applies to stage 4 and 5.

- (1) Identify the stage 3 blades (1-330), then examine the blade roots for their positional No. (Ref.Fig.503) and lay the blades out in numerical sequence. Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades. Ensure that the special nuts securing the mandrel retaining plate are loose, and the plate is positioned to allow the blades to be assembled. Insert the blades in numerical sequence into the rear of the disk starting at No.1 position, and working in a clockwise direction when viewing the mandrel (rear) side of the disk. When the blades are assembled, turn the mandrel retaining plate to secure the blades, then tighten the plate special nuts.

OVERHAUL

- (2) Identify the stage 3 blades (1-330) then examine the roots of the original blades for their positional No. (Ref.Fig.503) and lay the blades out in numerical sequence, leaving spaces where new blades are to be positioned. Noting the mass moment weight of the new blades, place the lightest new blades in vacant positions next to the heaviest original blades, and position the heaviest new blades in vacant positions next to the lightest original blades. Assemble the blades to the disk as detailed in para.(1).
- (3) Identify the stage 3 blades (1-330), then according to the mass moment weight of the blades (quoted on the labels), lay the blades out in sequence of weight, starting with the heaviest blade at one end and ending with the lightest blade at the other end. Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades. Ensure that the special nuts securing the mandrel retaining plate are loose, and the plate is positioned to allow the blades to be assembled. Assemble the blades to the rear of the disk, positioning the heaviest blade at No.1 position and the next heaviest blade diametrically opposite, then assemble the two lightest blades diametrically opposite each other and next to the heaviest blades. Assemble the remainder of the blades to the disk in sequence of weight, assembling alternate pairs of heavy and light blades and where possible, positioning equal weight blades opposite each other. When the blades are assembled, turn the mandrel retaining plate to secure the blades, then tighten the plate special nuts.

D. Assemble the Stage 3 Bladed Disk/Spacer Ring to the Balancing Machine.

- (1) Prepare the balancing machine (Avery 72 N 17 or 7210) (Ref.Fig.504).

PRINTED IN ENGLAND

TN40352

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (a) Ensure that the adjustable bearings (Tool 1154) are assembled and secured with keep plates to the left-hand and right-hand cradles of the balancing machine, and that the bearings are correctly set (Ref. para. 5.B.(3)(c)).
- (b) Ensure that the protection guard (Tool 1303 for Avery 72 N 17 or Tool 1500 for Avery 7210) is bolted to the bed of the machine.
- (2) Attach a hoist to the lifting eye of the lifting fixture (Tool 1162), then position the hoist over the balance mandrel and engage the two hooks of the fixture around the mandrel.
- (3) Remove the nuts and washers securing the mandrel to the mounting plate, then remove the support stand and traverse the hoist to disengage the mandrel from the mounting plate. If the mandrel/disk cannot be assembled direct to the balancing machine, lower it into the mobile stand (Tool 1165) engaging the mandrel journals in the stand support brackets. Disconnect the lifting fixture, then position the stand near the balancing machine. With the lifting fixture (Tool 1162) attached to the hoist, position the hooks of the fixture around the mandrel and raise it out of the stand.
- (4) Position the hoist over the balancing machine with the studded end of the mandrel towards the balancing machine drive. Lower the disk into the bottom half of the protection guard, lift the balancing machine drive and engage the mandrel studs in it, then adjust the position of the cradles (if necessary) to align with the bearing journals of the mandrel, with the mandrel correctly engaged with the drive. Adjust the position of the guard (if necessary), to give running clearance for the mandrel/bladed disk, then secure the cradles and guard (if required). Lower the mandrel onto the cradles, then disengage the lifting fixture from the mandrel and the hoist. Assemble washers and nuts to the mandrel studs and fully tighten the nuts.
- (5) If the balancing machine is an Avery 7210 secure the balancing mandrel in the machine cradles. Pivot the retaining arms of the cradles over the mandrel and engage them around the pillars, then secure them with thumbnuts.

TN11787

SUB-ASSEMBLY

**72-31-03**

Page 552

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (6) Using a hoist lower the top half of the guard onto the bottom half, ensuring that the access cover of the guard is towards the balancing machine operator. Pivot the bottom guard swing bolts into the top guard and secure with the thumbnuts.

E. Balance the Stage 3 Bladed Disk/Spacer Ring.

- (1) Apply lubricant 'A' to the spindles of the adjustable bearings and the journals of the mandrel, and ensure that they remain well lubricated throughout the balancing operation.
- (2) Carry out a static balance of the bladed disk, operating the balancing machine in accordance with the manufacturers instructions. The disk should be rotated at (approx.) 450 rpm and run for (approx.) 2 to 3 minutes for the temperature to stabilise. The balance of the disk/spacer must be within 4 drn. in. (180 grm mm). If the balance of the disk/spacer is outside the limit, rectify by the interchange of heavy and light-weight blades (Ref. para. (3)) and (if necessary), by the addition of balancing weights (Ref. para.(4)) to the out of balance position, until the disk/spacer is within limits.
- (3) Gain access to the blades by either hinging open the access cover, or releasing and removing the top half of the guard using a hoist. Release the special nuts securing the mandrel retaining plate, then turn the plate to allow the removal of the blades. Withdraw a heavy blade from as near the out of balance position as possible, and exchange it for a light blade from as near diametrically opposite as possible. Turn the mandrel retaining plate to secure the blades, then tighten the special nuts to lock the plate. Hinge close the guard access cover, or replace and secure the top of the guard, then recheck the balance.

NOTE: If the blades are the original and labels stating the mass moment weight are not attached to the blades, two or three of the blades, from the out of balance position, must be removed (noting their positions) and weighed (Ref. para.2), as must blades from the diametrically

SUB-ASSEMBLY

**72-31-03**

Page 553

OVERHAUL

sneema

opposite position. The suitable weight blades must be exchanged, and the remainder replaced in their original positions. A note of the weight and position of the removed blades should be kept for possible further exchange of blades.

- (4) If, after exchanges of blades, it is found that the balance cannot be brought within the limits (due to the size/weight of the blades), balancing weights must be added. Hinge open the guard access cover. Apply lubricant 'B' to a bolt (1-320), then insert the bolt into the bolt hole in the disk at the out of balance position and assemble a balance weight, (1-300, 1-305 or 1-310) and a nut (1-290) to the bolt. Ensure that the nut has a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m), then torque-tighten the nut between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (5) After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 1.5 thread pitches beyond nut chamfer, the bolt must be renewed (Ref.SB.72-8449-191). Hinge close the access cover, then recheck the balance. Exchange or add balancing weights until the balance is with 4 drn. in. (180 grm mm). The max. number of balancing weights that can be assembled to the disk is four, and the maximum number of weights of each weight that can be used is four off (1-300), 2 off (1-305) and 2 off (1-310).

**F. Remove the Bladed Disk/Spacer Ring from the Balancing Machine.**

- (1) Release the retaining arm of each cradle and pivot the arms out of the way if the balancing machine is an Avery 7210. With both types of Avery machines release and pivot down the swing bolts securing the top half of the guard, then using a hoist, raise the guard clear of the disk and lower onto a suitable surface. Remove the hoist from the guard.
- (2) Attach a hoist to the lifting fixture (Tool 1162), then position and lower the hoist over the disk and engage the two hooks of the fixture around the mandrel. Remove the nuts and washers securing the mandrel to the balancing machine drive. Raise the hoist and guide the disk out of the machine, and when possible, disengage the drive from the mandrel studs and lower the drive.

SUB-ASSEMBLY

**72-31-03**

OVERHAUL

- (3) If the mandrel/disk cannot be assembled direct to the mounting plate, lower it into the mobile stand (Tool 1165) engaging the mandrel journals in the stand support brackets. Disconnect the lifting fixture, then position the stand by the mounting plate. With the lifting fixture (Tool 1162) attached to a hoist, position the hooks of the fixture around the mandrel and raise it out of the stand.
- (4) Position the hoist alongside the Hydraclamp, then engage the mandrel over the mounting plate shaft and insert the studs through the plate. Assemble the washers and nuts to the studs and fully tighten the nuts.
- (5) Position the support stand (Tool 1667) under the end of the mandrel, then disconnect the lifting fixture from the mandrel and the hoist. Insert the retaining bolt (Tool 1184) into the end of the mandrel and screw it into the mounting plate.

NOTE: The blade numbering and assembling of the blade keys to the blades (Ref. para. (6) and (7)) may be left at this stage, and carried out with the disk assembled to the slave mandrel (Ref. para. G).

- (6) Release the special nuts securing the mandrel retaining plate, then turn the plate to allow the removal of the blades.
- (7) Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades, then examine the blade roots for their numbering (Ref. Fig. 503). Ensure that all the blades are numbered correctly in numerical sequence in a clockwise direction as viewed from the mandrel (rear) side of the disk, with No.1 blade in the datum slot. Etch all new blades with their position No., and renumber any blades that have been re-positioned, ensuring that all old position No. are obliterated. On completion of the numbering, remove each blade in turn, assemble a blade key (1-340 or 1-350) to the groove in the end face of the blade, then assemble the blade/key to the disk. Turn the mandrel retaining plate to secure the blades.

NOTE: Ensure that the dimension from the face of the key to the top of the dimple does not exceed 0.045 in. (1.14 mm) (Ref. Fig. 515).

- (8) Attach a hoist to the shackle of the retaining bolt, then release the Hydraclamp (if locked) and raise/traverse the hoist to position the mandrel vertically. Lock the Hydraclamp, then release the hoist.
- (9) Assemble the protector/retaining band (Tool 1125) around the blade tips. Assemble the two halves of the protector (Tool 1167) around the labyrinth of the spacer ring, then secure the two halves together with the clamp screws. Remove the special nuts securing the disk/spacer to the balancing mandrel.
- (10) Assemble the lifting fixture (Tool 365) to the stage 2-3 spacer ring (Ref.Fig.514).
  - (a) Attach a hoist to the lifting ring of the lifting fixture, then position the hoist over the spacer.
  - (b) Ensure that the pins of the hand knobs are located in the holes at the 'FREE' position, then lower the hoist and engage the locating plate of the fixture in the spacer. Withdraw the pins of the hand knobs from the 'FREE' position locating holes, turn the knobs to the 'LOCK' position, and ensure that the pins locate in the locating holes.
- (11) Screw the four extractor bolts (Tool 1185) into the tapped holes in the balancing mandrel plate (from underneath) until they contact the disk, then screw the bolts in, in equal progressive increments until the disk is released from the mandrel locating/securing studs. Position and lower the disk onto support (Tool 1326), suitable support blocks or a suitable flat smooth surface.
- (12) Withdraw the pins of the hand knobs from the 'LOCK' position locating holes, turn the knobs to the 'FREE' position, and ensure that the pins locate in the locating holes. Raise the fixture from the spacer and lower onto a suitable surface, then release the hoist.
- (13) Remove the balancing mandrel from the mounting plate (Ref.Fig.507).
  - (a) Attach a hoist to the shackle of the retaining bolt, release the Hydraclamp, then lower the mandrel onto the support stand (Tool 1667).

Release the hoist then remove the retaining bolt. Remove the extractor bolts from the plate of the balancing mandrel.

- (b) Attach a hoist to the lifting eye of the lifting fixture (Tool 1162), then position the hoist over the balancing mandrel and engage the two hooks of the fixture around the mandrel.
- (c) Remove the nuts and washers securing the mandrel to the mounting plate, then remove the support stand and traverse the hoist to disengage the mandrel from the mounting plate. Position and lower the mandrel into its storage stand, then remove the lifting fixture from the mandrel and the hoist. Assemble the washers and nuts to the mandrel studs, and the special nuts to the mandrel locating/securing studs.

G. Remove the Spacer Ring from the Disk and Secure the Blades.

- (1) Remove the slave nuts, then remove the spacer ring from the disk.

NOTE: With the disk resting on a flat surface or support(s), lock the blade keys as detailed in para.(7), or if preferred, assemble the disk to a slave mandrel for locking the blades (Ref. Fig.516), and if not carried out previously, the blade numbering and assembling of the blade keys as detailed in para.(2) to (11).

- (2) Assemble the slave mandrel (Tool 1215) to the mounting plate.

NOTE: The slave mandrel may be assembled by hand as detailed in para.(a) or by lifting fixture as detailed in para.(b) to (d).

- (a) Position the mounting plate with its axis vertical, then lock the Hydraclamp. Lower the slave mandrel over the mounting plate shaft with the mandrel retaining nut uppermost. Lower the retaining bolt (Tool 874) into the mandrel and screw it into the mounting plate.
- (b) Connect a hoist to the lifting eye of the lifting fixture (Tool 1162) then position the fixture over the slave mandrel and assemble the mandrel to the fixture.

SUB-ASSEMBLY

**72-31-03**

Page 557

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (c) Position the mounting plate with its axis horizontal, then lock the Hydraclamp. Position the hoist alongside the mounting plate, then traverse the hoist and engage the slave mandrel over the mounting plate shaft ensuring that the mandrel retaining nut can be removed from the shaft. Insert the retaining bolt (Tool 874) into the mandrel and screw it into the mounting plate.
  - (d) Position and adjust the support stand (Tool 1667) to support the end of the mandrel. Disconnect the lifting fixture from the mandrel and the hoist. Lift the mandrel to the vertical position by hand, or attach a hoist to the shackle of the retaining bolt, then traverse/raise the hoist to bring the mandrel to the vertical position. Lock the Hydraclamp and release the hoist if used.
- (3) Assemble the multiple leg sling (Tool 1217) to the disk.
- (a) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.
  - (b) If the four slave bolts (Tool 367) are not assembled, insert the bolts (evenly spaced) into the bolt holes from the rear of the disk so that they protrude above the disk. If the disk is not supported on suitable blocks or support (Tool 1326), assemble the disk to them if required.
  - (c) Lower the sling onto the disk, locate the sling blocks over the slave bolts and screw the thumb-nuts onto the bolts.
- (4) Assemble the stage 3 disk to the slave mandrel.
- (a) Raise the hoist and position the disk over the slave mandrel.
  - (b) Remove the retaining nut from the mandrel, then lower the disk over the mandrel until it abuts the shoulder. Replace and fully tighten the mandrel retaining nut.
  - (c) Unscrew the thumbnuts of the sling and remove the slave bolts. Remove the sling from the hoist.

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (5) Attach a hoist to the shackle of the retaining bolt, then release the Hydraclamp and lower the mandrel to the horizontal position. Position the support stand (Tool 1667) under the end of the mandrel to take the weight, then remove the hoist.
- (6) If not already carried out, number the blades and assemble the blade keys as detailed in para.F.(7).
- (7) Ensure that a blade is square in the disk slot and not loaded to one side or the other by the action of the protection/retaining band, and that the blade tang abuts the disk and is held against it, then using the hammer (Tool 1655), bend the protruding end of the key against the disk. Ensure that the key is bent over the edge of the disk, but care must be taken that the bend of the key is not too acute causing a fracture of the key. Lock the remainder of the blades in the same manner. Using a feeler gauge, check each blade and ensure that the maximum end-float of the blade root in the disk does not exceed 0.015 in. (0,38 mm).
- (8) Assemble a hoist to the shackle of the retaining bolt, then raise/traverse the hoist to bring the mandrel to the vertical position. Lock the Hydraclamp, then release the hoist.
- (9) Assemble the multiple leg sling (Tool 1217) to the disk.
- (a) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.
- (b) Insert four slave bolts (Tool 367) (evenly spaced) into the bolt holes from underneath, locate the sling blocks over the slave bolts and screw the thumbnuts onto the bolts.

9. Balance the Stage 4 Rotor and Stage 3-4 Spacer Ring

NOTE: The stage 4 blades should be received in the container (Tool 1398). Do not remove the blades until they are required for assembly.

A. Assemble the Stage 3-4 Spacer Ring to the Stage 4 Disk.

NOTE: The disk (2-60) should be received in the container (Tool 1407) and the spacer ring (2-30) in the container (Tool 1411).

- (1) Assemble the spacer ring (2-30) to the disk (2-60) as detailed in para.8.A. with the difference that the disk datum hole marks  $\rightarrow 0$  are on the edge of the disk not on the face, and the slave bolt (Tool 426) must be used instead of (Tool 367) (Ref. para.(3)).

B. Assemble the Stage 4 Disk/Spacer Ring to the Balancing Mandrel.

- (1) Assemble the disk/spacer to the balancing mandrel as detailed in para.8.B. with the difference that the balance mandrel (Tool 361) must be used instead of (Tool 379) (Ref. para.(2)), and para.(3) and (5) to read as follows:
  - (3) Assemble the lifting fixture (Tool 444) to the stage 3-4 spacer ring (Ref.Fig.517).
    - (a) Attach a hoist to the lifting ring of the lifting fixture, then position the hoist over the spacer.
    - (b) Ensure that the knurled nuts are unscrewed and the claws turned to align them with the plate, then lower the hoist and engage the locating plate of the fixture in the spacer. Turn the claws outwards to engage them under the spacer flange, then tighten the knurled nuts to lock the claws in position.
  - (5) Release the knurled nuts of the fixture, turn the claws sideways, then raise the fixture from the spacer ring and remove the fixture from the hoist.

C. Assemble the Blades to Stage 4 Disk.

- (1) Assemble the stage 4 blades (2-40) to the disk as detailed in para.8.C.

NOTE: If all the original blades are available and undamaged and are to be assembled to the original disk/spacer the bladed disk does not require balancing, but the blades must be assembled to the disk with serviceable blade keys (2-50) as detailed in para.8.F.(7).

D. Assemble the Stage 4 Bladed Disk/Spacer Ring to the Balancing Machine.

- (1) Assemble the bladed disk/spacer ring to the balancing machine as detailed in para.8.D.

E. Balance the Stage 4 Bladed Disk/Spacer Ring.

- (1) Balance the bladed disk/spacer ring as detailed in para.8.E. to within 4 drn in. (180 grm mm) by the interchange of blades only. Ignore the reference to balancing weights in para.(2) and ignore para.(4), and mass moment weigh the blades (if necessary) as detailed in para.3.

F. Remove the Bladed Disk/Spacer Ring from the Balancing Machine.

- (1) Remove the bladed disk/spacer ring from the balancing machine and assemble the blade keys as detailed in para.8.F. with the following differences.
  - (a) Use blade keys (2-50) instead of (1-340 or 1-350) (Ref.para.(7)). The protection/retaining band (Tool 1126) must be used instead of (Tool 1125), and the spacer ring labyrinth protector (Tool 1168) must be used instead of (Tool 1167) (Ref.para.(9)).

(b) Amend para. (10) and (12) to read as follows:

(10) Assemble the lifting fixture (Tool 444) to the stage 3-4 spacer ring.

- (a) Attach a hoist to the lifting ring of the lifting fixture, then position the hoist over the spacer.
- (b) Ensure that the knurled nuts are unscrewed and the claws turned to align them with the plate, then lower the hoist and engage the locating plate of the fixture in the spacer. Turn the claws outwards to engage them under the spacer flange, then tighten the knurled nuts to lock the claws in position.

(12) Release the knurled nuts of the fixture, turn the claws sideways, then raise the fixture from the spacer ring and remove the fixture from the hoist.

G. Remove the Spacer Ring from the Disk and Secure the Blades.

- (1) Remove the spacer ring from the disk and secure the blades as detailed in para.8.G. with the difference that the slave bolt (Tool 426) must be used instead of (Tool 367) (Ref. para.(3)(b) and (9)(b)).

10. Balance the Stage 5 Rotor and Stage 4-5 Spacer Ring

NOTE: The stage 5 blades should be received in the container (Tool 1399). Do not remove the blades until required for assembly.

A. Assemble the Stage 4-5 Spacer Ring to the Stage 5 Disk.

NOTE: The disk (2-120) should be received in the container (Tool 1407) and the spacer ring in the container (Tool 1411).

OVERHAUL

- (12) Release the hand knobs and slide them to the 'UNLOCK' position. Raise the sling from the spacer ring and remove the sling from the hoist.

G. Remove the Spacer Ring from the Disk and Secure the Blades.

- (1) Remove the spacer ring from the disk and secure the blades as detailed in para.8.G. with the difference that the slave bolts (Tool 1164) must be used instead of (Tool 367) (Ref. para.(3)(b) and (9)(b)).

### 13. Balance the Stage 1 Rotor

NOTE: The stage 1 blades should be received in the container (Tool 1395). Do not remove the blades until required for assembly.

A. Assemble the Blades to Stage 1 Disk (Ref.Fig.520).

- (1) Position the balancing adapter (Tool 1845) on a work surface then unscrew and remove the collar nut and retaining plate from the adapter. Unscrew and remove the seven nuts and washers from the adapter location pins (Ref.Fig.521).
- (2) Assemble the lifting fixture (Tool 401) to the stage 1 disk (1-160) (Ref.Fig.519).

NOTE: The disk should be received in the container (Tool 1409).

NOTE: The lifting fixture should be assembled to the rear face of the disk, denoted by the smaller outside diameter.

- (a) Attach a hoist to the lifting fixture, then position the hoist over the disk.

- (b) Unscrew and remove the knurled nut and clamp plate from the disk container.
  - (c) Ensure that the lifting fixture hand knobs are located at the 'FREE' position, then lower the hoist and engage the end plate of the fixture in the disk. Withdraw the hand knobs from the 'FREE' position and turn the knobs to the 'LOCK' position, engaging the lugs under the disk, depress the hand knobs and ensure that the pins locate in the locking holes.
- (3) Raise the hoist and position the disk above the adapter. Align the holes in the disk with the seven location pins then lower the disk on to the adapter. Secure the disk to the adapter by reassembling the washers and nuts to the location pins.
- (4) Disengage the hoist from the lifting fixture and remove the hoist.
- (5) Assemble balancing weights to the stage 1 disk (Ref.Fig.520).
- (a) Apply lubricant 'B' to the 19 bolts (1-140), then insert the bolts, from the rear of the disk, into the outer ring of holes in the disk, and assemble a balancing weight (1-120) and nut (1-110) to each bolt. Ensure that each nut has a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m), then torque-tighten the nuts between 85 and 95 lbf in. (9,6 and 10,7 N.m).
  - (b) After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 1.5 thread pitches beyond nut chamfer, the bolt must be renewed (Ref.SB.72-8449-191).
- (6) Assemble the blades to the stage 1 disk (Ref.Fig.520).

NOTE: If all the original blades are available and undamaged then assemble the blades as detailed in para.(a). If the blades include 3 repaired and/or new blades, then the blades must be assembled as detailed in para.(b). If the blades include more than 3 repaired and/or new blades then the blades must be assembled as detailed in para.(c). Ensure that the aggregate blending depth of repaired blades does not exceed 3.600 in. (91,44 mm) (Ref. 72-31-03 Repair No.6).

OVERHAUL

- (a) Identify the stage 1 blades (1-150), then examine the blade roots for their positional No. (Ref.Fig.503) and lay the blades out in numerical sequence. Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades. Insert the blades, in numerical sequence, from the rear of the disk starting at No.1 position and working in a clockwise direction.
- (b) Identify the stage 1 blades (1-150) then examine the roots of the original blades for their positional No. (Ref.Fig.503) and lay the blades out in numerical sequence, leaving spaces where new blades are to be positioned. Noting the mass moment weight of the new blades, place the lightest new blades in vacant positions next to the heaviest original blades, and position the heaviest new blades in vacant positions next to the lightest original blades. Assemble the blades to the disk as detailed in para.(a).
- (c) Identify the stage 1 blades (1-150), then according to the mass moment weight of the blades (quoted on the labels), lay the blades out in sequence of weight, starting with the heaviest blade and ending with the lightest. Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades (Ref.Fig.503). Assemble the blades from the rear of the disk positioning the heaviest blade at No.1 position and the next heaviest blade diametrically opposite, then assemble the two lightest blades dimetrically opposite each other and next to the heaviest blades. Assemble the remainder of the blades to the disk in sequence of weight, assembling alternate pairs of heavy and light blades and where possible, positioning equal weight blades opposite each other.

PRINTED IN ENGLAND

TN17075

OLYMPUS 593

MK.610-14-28  
OVERHAUL

B. Assemble the Stage 1 Bladed Disk/Adapter to the Balancing Machine.

- (1) Attach a hoist to the lifting fixture assembled to the disk. Raise the hoist and position the disk/adapter above the balancing machine.
- (2) Align the holes in the adapter hub with the spindle head of the machine, then lower the adapter on to the machine and secure with the six retaining screws (Tool 1826) (Ref.Fig.521).
- (3) Raise the lifting fixture hand knobs and move them to the 'FREE' position, depress the knobs to engage the locking holes, then raise the hoist and remove the fixture.
- (4) Pass the blade retaining plate spigot over the central bolt in the adapter and secure the plate with the collar nut.

C. Balance the Stage 1 Bladed Disk.

- (1) Carry out a static balance of the bladed disk, operating the balancing machine in accordance with the manufacturers instructions. The disk should be rotated as for engine rotation (counter-clockwise viewed from the rear). The balance of the disk must be within 4 drms in. (180 grms mm). If the balance of the disk is outside the limit, rectify by the interchange of heavy and light weight blades (Ref.para. (2)), and the interchange of heavy and light weight balancing weights (ref.para.(3)) from the out of balance angular position, until the disk is within limits. Before any blades or weights are interchanged check the out of balance readings by rotating the disk 180 degrees relative to the adapter and retaining plate and repeating the balancing procedure.

OVERHAUL

- (2) Gain access to the blades by unscrewing and removing the collar nut and removing the blade retaining plate. Withdraw a heavy blade from as near the out of balance position as possible, and exchange it for a light blade from as near diametrically opposite as possible then reassemble the retaining plate and collar nut.

NOTE: If the blades are the original and labels stating the mass moment weight are not attached to the blades, two or three of the blades, from the out of balance position, must be removed (noting their positions) and weighed (Ref. para. 2.), as must blades from the diametrically opposite position. The suitable weight blades must be exchanged, and the remainder replaced in their original positions. Record the weight and position of the blades removed for possible further exchange of blades.

- (3) If, after exchanges of blades, it is found that the balance cannot be brought within the limits (due to the size/weight of the blades), the balancing weights must be changed. Release and remove a (light-weight) balancing weight (1-120) from the front of the disk at the out of balance position, (Ref. Fig. 520) assemble a (heavier weight) balancing weight, (either 1-125 or 1-130) to the bolt. Lubricate the nut (1-110) with lubricant 'B', then screw it onto the bolt, ensure that it has a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) and torque-tighten between 85 and 95 lbf in. (9,6 and 10,7 N.m). The max number of heavy balancing weights that can be used is 4 off (1-125) and 6 off (1-130).

D. Remove the Bladed Disk/Adapter from the Balancing Machine and Number the Blades.

- (1) Unscrew and remove the collar nut and retaining plate from the balancing adapter.

- (2) Assemble the blade protection/retaining band (Tool 1123) to the blade tips.
- (3) Assemble the lifting fixture (Tool 401) to the disk/adapter.
  - (a) Attach a hoist to the lifting fixture and position the fixture above the balancing machine.
  - (b) Ensure the fixture hand knobs are in the 'FREE' position then lower the fixture and engage the plate in the disk.
  - (c) Raise the fixture hand knobs and move them to the LOCK position, this engages the claws beneath the disk, depress the knobs to engage their locking holes.
- (4) Unscrew and remove the six retaining screws which secure the adapter to the balancing machine then raise the hoist and position the disk/adapter on a work surface; disengage the hoist from the lifting fixture then remove the hoist.
- (5) Examine the edge of the disk for the No.1 blade datum marks  $\rightarrow 0$ , then examine the blade roots for their numbering (Ref.Fig.503). Ensure that all the blades are numbered correctly in numerical sequence in a clockwise direction, viewed from the rear side of the disk, with No.1 blade in the datum slot. Etch all new blades with their position No. and renumber any blades that have been re-positioned, ensure that all old position No. are obliterated.

E. Remove the Bladed Disk from the Balancing Adapter.

- (1) Unscrew and remove the seven nuts and washers which secure the disk to the balancing adapter then attach a hoist to the lifting fixture.

SUB-ASSEMBLY

**72-31-03**

OVERHAUL

- (2) Position the centre support (Tool 1326) on a work surface then raise the hoist to remove the disk from the adapter and position the disk on the support.
- (3) Raise the lifting fixture hand knobs and move them to the 'FREE' position, depress the knobs to engage the locking holes then raise the hoist and remove the fixture.

F. Check the Stage 1 Blade Tang Clearances.

- (1) Remove the protection/retaining band from the blade tips (if assembled).
- (2) Examine the edge of the disk and identify the datum hole by the datum mark  $\rightarrow 0$ . Remove the stage 1-2 spacer ring (1-190) from its container (Tool 1410), examine the spacer and identify the datum hole by the datum mark  $\rightarrow 0$  on the edge of the flange (Ref.Fig.503). Release and remove the protector (Tool 443) (if assembled) from the spacer ring, then place the spacer on the disk, align the datum holes, and ensure that the spacer abuts the disk.
- (3) Using feeler gauges, check that there is a clearance between each blade tang and the spacer ring of between 0.002 and 0.008 in. (0,05 and 0,20 mm).
- (4) Remove the spacer ring from the disk, assemble the protector (Tool 443) to the spacer, then stow the spacer on the top shelf of the container (Tool 1410). Place the protection/retaining band (Tool 1123) around the tips of the blades, then place the disk on a pallet, use the lifting fixture (Tool 401) (Ref.para.A.(2)) if required.

NOTE: The stage 1 bladed disk is now ready to be passed to the LP Compressor Assembly (72-31-00 Assembly).

14. Balance the Stage 2 Rotor and Stage 1-2 Spacer Ring

NOTE: The stage 2 blades should be received in the container (Tool 1396). Do not remove the blades until required for assembly.

A. Assemble the Stage 1-2 Spacer Ring to the Stage 2 Disk.

NOTE: The disk (1-250) should be received in the container (Tool 1407).

- (1) Unscrew and remove the knurled nut and clamp plate from the disk container. Ensure the disk has its front face, denoted by the plain lobes, uppermost.
- (2) Attach the multiple leg sling (Tool 1285) to a hoist and position the hoist above the disk.
- (3) Unscrew and remove the three nuts and washers from the waisted bolts of the sling then pass the bolts through the holes in the disk. Reassemble the washers and nuts to the bolts to secure the disk to the sling.
- (4) Raise the hoist and position the disk on suitable blocks or support (Tool 1326).
- (5) Unscrew the nuts from the waisted bolts of the sling, raise the hoist and remove the sling from the disk.
- (6) Examine the front face of the disk at the blade root position, and identify the datum hole by the datum mark  $\rightarrow 0$  to each side of No.1 blade slot. Remove the spacer (1-190) from the container (Tool 1410) (top shelf), then examine the spacer ring and identify the datum hole by the datum mark  $\rightarrow 00 \leftarrow$  on the edge of the flange (Ref.Fig.503). Place the spacer ring on the disk aligning the datum holes.
- (7) Insert the four slave bolts (Tool 366) into the bolt holes from underneath the disk, ensure that they are evenly spaced, then assemble a slave washer and nut to each bolt (Ref.Fig.522). Fully tighten the nuts then invert the assembly and reposition on the support.

OVERHAUL

B. Assemble the Blades to Stage 2 Disk.

NOTE: If all the original blades are available and undamaged then assemble the blades as detailed in para.(1). If the blades include 4 repaired and/or new blades, then the blades must be assembled as detailed in para.(2). If the blades include more than 4 repaired and/or new blades then the blades must be assembled as detailed in para.(3). Ensure that the aggregate blending depth of repaired blades does not exceed 3.600 in. (91,44 mm) (Ref. 72-31-03 Repair No.6).

- (1) Identify the stage 2 blades (1-240), then examine the blade roots for their positional No. (Ref.Fig.503) and lay the blades out in numerical sequence. Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades. Insert the blades in numerical sequence, starting at No.1 position and working in a clockwise direction.
- (2) Identify the stage 2 blades (1-240) then examine the roots of the original blades for their positional No. (Ref.Fig.503) and lay the blades out in numerical sequence, leaving spaces where new blades are to be positioned. Noting the mass moment weight of the new blades, place the lightest new blades in vacant positions next to the heaviest original blades, and position the heaviest new blades in vacant positions next to the lightest original blades. Assemble the blades to the disk as detailed in para. (1).
- (3) Identify the stage 2 blades (1-240), then according to the mass moment weight of the blades (quoted on the labels), lay the blades out in sequence of weight, starting with the heaviest blade and ending with the lightest. Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades. Assemble the blades to the disk positioning the heaviest blade at No.1 position and the next heaviest blade diametrically opposite. Assemble the two lightest blades diametrically opposite each other and next to the heaviest blades.

IN40347

OLYMPUS 593

MK.610-14-28  
OVERHAUL

Assemble the remainder of the blades to the disk in sequence of weight, assembling alternate pairs of heavy and light blades and where possible, positioning equal weight blades diametrically opposite each other.

- (4) Assemble the blade protection/retaining band (Tool 1124) to the blade tips then invert the assembly and reposition on the support.

C. Assemble the Balancing Adapter and Hub to the Balancing Machine.

NOTE: Ensure the blade retaining plate, attached to the underside of the adapter, is secure.

- (1) Assemble the adapter (Tool 1846) to the hub (Tool 1850) and secure with the six retaining screws, ensure the four location pins (Tool 1849) and four location studs are assembled to the adapter (Ref.Fig.523).
- (2) Assemble and secure the adapter/hub to the spindle head of the balancing machine with the six retaining screws (Tool 1826).
- (3) Unscrew and remove the nuts and washers from the adapter location pins.

NOTE: After use the hub may be left attached to the adapter.

D. Assemble the Bladed Disk/Spacer Ring to the Balancing Machine.

- (1) Assemble the lifting fixture (Tool 364) to the stage 1-2 spacer ring (Ref.Fig.522).
  - (a) Attach a hoist to the lifting ring of the lifting fixture, then position the hoist over the spacer/disk.

- (b) Ensure that the lifting fixture hand knobs are located at the 'FREE' position, then lower the hoist and engage the locating plate of the fixture in the spacer. Withdraw the hand knobs and turn to the 'LOCK' position, engaging the claws under the spacer flange, depress the knobs to engage the locking holes.
- (2) Raise the hoist and position the disk over the balancing machine, align the holes in the disk with the pins in the adapter. Lower the disk/spacer over the adapter locating/securing pins, ensure that it is lowered squarely until the disk abuts the adapter.
- (3) Withdraw the lifting fixture hand knobs from the 'LOCK' position and turn the knobs to the 'FREE' position, depress the knobs to engage the locking holes. Raise the fixture from the spacer ring and lower the fixture onto a suitable surface, then release the hoist.
- (4) Screw the special nuts and washers on to the location pins (Ref.Fig.523) and fully tighten the nuts. Adjust the blade retaining plate setting screws to ensure the blades are fully forward in the disk. Remove the blade protection/retaining band from the blade tips and, if assembled, the labyrinth protector from the spacer ring.

E. Balance the Stage 2 Bladed Disk/Spacer Ring.

- (1) Carry out a static balance of the bladed disk, operating the balancing machine in accordance with the manufacturers instructions. The disk should be rotated as for engine rotation, (counter-clockwise viewed from the rear). The balance of the disk must be within 4 drmm in. (180 grmm mm) and is achieved by the interchange of heavy and light blades (Ref.para.(2)) and the addition, if necessary, of balancing weights (Ref.para.(3)). Before any blades are interchanged or weights added, check the out of balance readings by rotating the disk/spacer 180 degrees, relative to the adapter, before this operation fit the blade protection/retaining band (Tool 1124), and repeat the balancing procedure.

- (2) To remove a blade from the disk unscrew the retaining plate setting screws, to relieve the pressure on the blades, then unscrew the clamp screws sufficient to allow the retaining plate to rotate. Turn the plate, to line up one of the cut-outs in the plate with the blade to be removed. Withdraw a heavy blade from as near the out of balance position as possible, and exchange it for a light blade diametrically opposite. Turn the retaining plate to secure the blades, then tighten the clamp screws to secure the plate. Adjust the plate setting screws to ensure the blades are fully forward, then recheck the balance.

NOTE: If the blades are the original and labels stating the mass moment weight are not attached to the blades, two or three of the blades, from the out of balance position must be removed (noting their positions) and weighed (Ref. para.2), as must blades from the diametrically opposite position. The suitable weight blades must be exchanged, and the remainder replaced in their original positions. A note of the weight and position of the removed blades should be kept for possible further exchange of blades.

- (3) If after exchange of blades, it is found that the balance cannot be brought within the limits, balancing weights must be added. Apply lubricant 'B' to the threads of the bolt (1-230), then assemble the bolt to the disk at the out of balance position, assemble a balance weight, (1-210, 1-215 or 1-220) and a nut (1-200) to the bolt (Ref. Fig. 523). Ensure that the nut has a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m), then torque-tighten the nut between 85 and 95 lbf in. (9,6 and 10,7 N.m). After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 1.5 thread pitches beyond nut chamfer, the bolt must be renewed (Ref. SB.72-8449-191). The max number of balancing weights of any one weight or combination of weights that can be assembled to the disk is four.

F. Remove the Bladed Disk/Spacer Ring from the Balancing Machine.

- (1) Assemble the blade protection/retaining band (Tool 1124) to the blade tips.
- (2) Unscrew and remove the four nuts which secure the spacer/disk to the adapter location pins.
- (3) Assemble the lifting fixture (Tool 364) to the stage 1-2 spacer ring (Ref.Fig.522).
  - (a) Attach a hoist to the lifting ring of the lifting fixture, then position hoist over the spacer/disk.
  - (b) Ensure that the lifting fixture hand knobs are located at the 'FREE' position then lower the hoist and engage the locating plate of the fixture in the spacer. Withdraw the hand knobs and move to the 'LOCK' position, engaging the claws under the spacer flange, depress the knobs to engage the locking holes.
- (4) Raise the hoist and position the spacer/disk on the support (Tool 1326).

G. Remove the Spacer Ring from the Disk and Number the Blades.

- (1) Assemble the two halves of the protector (Tool 443) around the labyrinth of the spacer ring and secure the halves together with the clamp screws.
- (2) Unscrew and remove the slave nuts and bolts which secure the spacer to the disk. Raise the hoist to remove the spacer from the disk.
- (3) Remove the lifting fixture from the spacer (Ref.para.D.(3)) then stow the spacer on the top shelf of the container (Tool 1410).

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (4) Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades then examine the blade roots for their numbering (Ref.Fig.503). Ensure that all the blades are numbered correctly in numerical sequence in a clockwise direction as viewed from the rear of the disk, with No.1 blade in the datum slot. Etch all new blades with their position No., and renumber any blades that have been re-positioned, ensure that all old position No. are obliterated.

H. Check the Stage 2 Blade Tang Clearances.

- (1) Examine the front face of the disk at the blade root position, and identify the datum hole by the datum mark  $\rightarrow 00 \leftarrow$  on each side of No.1 blade slot. Invert the disk, its rear face is now uppermost, and reposition the disk on the centre support (Tool 1326), then remove the protection/retaining band from the blade tips. Examine the stage 2-3 spacer ring (1-280) and identify the datum hole by the datum mark  $\rightarrow 00 \leftarrow$  on the edge of the flange (Ref.Fig.503). Release and remove the protector (Tool 1167) (if assembled) from the spacer ring, then place the spacer ring on the disk aligning the datum holes, ensure that the spacer abuts the disk.
- (3) Using feeler gauges, check that there is a clearance between each blade tang and the spacer ring between 0.002 and 0.008 in. (0.05 and 0.20 mm).
- (4) Remove the spacer ring from the disk, assemble the protector (Tool 1167) to the spacer, then stow the spacer on the middle shelf of the container (Tool 1410). Place the protection/retaining band (Tool 1124) around the tips of the blades, and place the disk on a pallet. Use the multiple leg sling (Tool 1285) (if required) to place it on the pallet.

NOTE: The stage 2 bladed disk and stage 1-2 spacer ring are now ready to be passed to the LP Compressor Assembly (72-31-00 Assembly).

OLYMPUS 593

MK.610-14-28  
OVERHAUL

15. Balance the Stage 3 Rotor and Stage 2-3 Spacer Ring

NOTE: The stage 3 blades should be received in the container (Tool 1397). Do not remove the blades until required for assembly.

A. Assemble the Stage 2-3 Spacer Ring to the Stage 3 Disk.

NOTE: The disk (1-360) should be received in the container (Tool 1408).

- (1) Unscrew and remove the knurled nut and clamp plate from the disk container. Ensure the disk is front face, denoted by the smaller outside diameter, uppermost.
- (2) Attach the multiple leg sling (Tool 1217) to a hoist and position the hoist above the disk. Lower the sling so that the four blocks of the sling rest on the disk.
- (3) Assemble to the disk, from the rear face, four slave bolts (Tool 367) and engage each bolt in the larger knurled nuts of the sling blocks.
- (4) Fully tighten the knurled nuts then raise the hoist and position the disk on suitable blocks or support (Tool 1326). Unscrew the large knurled nuts, raise the hoist and remove the sling.
- (5) Examine the front face of the disk at the blade root position, and identify the datum hole by the datum marks  $\rightarrow 00 \leftarrow$  to each side of No.1 blade slot. Remove the spacer ring (1-280) from the container (Tool 1410) and identify the datum hole by the datum mark  $\rightarrow 00 \leftarrow$  on the edge of the flange (Ref.Fig.503). Place the spacer ring on the disk aligning the datum holes.
- (6) Assemble a slave washer and nut to each of the slave bolts in the disk (Ref.Fig.524). Fully tighten the nuts then invert the disk/spacer and reposition on the support.

B. Assemble the Blades to Stage 3 Disk.

NOTE: If all the original blades are available and undamaged then assemble the blades as detailed in para.(1). If the blades include 4 repaired and/or new blades, then the blades must be assembled as detailed in para.(2). If the blades include more than 4 repaired and/or new blades then the blades must be assembled as detailed in para.(3). Ensure that the aggregate blending depth of repaired blades does not exceed 3.200 in. (81,28 mm) (Ref.72-31-03 Repair No.6).

- (1) Identify the stage 3 blades (1-330), then examine the blade roots for their positional No. (Ref.Fig.503) and lay the blades out in numerical sequence. Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades. Insert the blades in numerical sequence from the rear of the disk starting at No.1 position, and working in a clockwise direction.
- (2) Identify the stage 3 blades (1-330) then examine the roots of the original blades for their positional No. (Ref.Fig.503) and lay the blades out in numerical sequence, leaving spaces where new blades are to be positioned. Noting the mass moment weight of the new blades, place the lightest new blades in vacant positions next to the heaviest original blades and position the heaviest new blades in vacant positions next to the lightest original blades. Assemble the blades to the disk as detailed in para.(1).
- (3) Identify the stage 3 blades (1-330), then according to the mass moment weight of the blades (quoted on the labels), lay the blades out in sequence of weight, starting with the heaviest blade and ending with the lightest. Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades. Assemble the blades from the rear of the disk. Position the heaviest blade at No.1 position and the next heaviest blade diametrically opposite, then assemble the two lightest blades diametrically opposite each other and next to the heaviest blades. Assemble the remainder of the blades to the disk in sequence of weight, assembling alternate pairs of heavy and light blades and where possible, positioning equal weight blades opposite each other.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (4) Assemble the protection/retaining band (Tool 1125) to the blade tips then invert the disk/spacer and reposition on the support.

C. Assemble the Balancing Adapter to the Balancing Machine.

NOTE: Ensure the blade retaining plate, attached to the underside of the adapter, is secure.

- (1) Screw a lifting eye ( $\frac{7}{8}$  in. WHIT.) into the hub of the adapter (Tool 1847).
- (2) Attach a hoist to the lifting eye then raise the hoist and position the adapter above the balancing machine. Align the holes in the adapter hub and machine spindle head then lower the adapter on to the machine, secure the adapter to the machine with the six retaining screws (Tool 1826) (Ref.Fig.525). Unscrew and remove the nuts and washers from the adapter location pins.

D. Assemble the Bladed Disk/Spacer Ring to the Balancing Machine.

- (1) Assemble the lifting fixture (Tool 365) to the stage 2-3 spacer ring (Ref.Fig.524).
  - (a) Attach a hoist to the lifting fixture and position the hoist over the spacer.
  - (b) Ensure the lifting fixture hand knobs are in the 'FREE' position then lower the hoist and engage the locating plate in the spacer. Raise the hand knobs and move them to the 'LOCK' position then depress the knobs to engage their locking holes.
- (2) Raise the hoist and position the spacer/disk above the balancing machine. Align the holes in the disk, with the location pins in the adapter then lower the assembly on to the adapter (Ref.Fig.525).

- (3) Raise the lifting fixture hand knobs, move them to the 'FREE' position then depress the knobs to engage their locking holes. Raise the hoist and remove the lifting fixture.
- (4) Reassemble the six special washers and nuts to the location pins and fully tighten the nuts. Remove the blade protection/retaining band from the blade tips and, if assembled, remove the labyrinth protector from the spacer ring.

E. Balance the Stage 3 Bladed Disk/Spacer Ring.

- (1) Carry out a static balance of the bladed disk, operating the balancing machine in accordance with the manufacturers instructions. The disk should be rotated as for engine rotation, counter-clockwise viewed from the rear. The balance of the disk/spacer must be within 4 grm in. (180 grm mm). If the balance of the disk/spacer is outside the limit, rectify by the interchange of heavy and light-weight blades (Ref. para.(3)) and (if necessary), by the addition of balancing weights (Ref. para.(4)) to the out of balance position, until the disk/spacer is within limits. Before any blades are interchanged or weights added, check the out of balance readings by rotating the disk/spacer 180 deg, relative to the adapter, before this operation assemble the blade protection/retaining band, and repeat the balancing procedure.
- (3) To remove a blade from the disk unscrew the clamp screws, on the underside of the adapter, sufficient to allow the retaining plate to rotate. Turn the plate, to line up one of the cut-outs with the blade to be removed, then slide the blade down out of the disk. Withdraw a heavy blade from as near the out of balance position as possible, and exchange it for a light blade diametrically opposite. Turn the retaining plate to secure the blades and tighten the clamp screws to lock the plate, then recheck the balance.

NOTE: If the blades are the original and labels stating the mass moment weight are not attached to the blades, two or three of the blades, from

the out of balance position, must be removed (noting their positions) and weighed (Ref. para.2), as must blades from the diametrically opposite position. The suitable weight blades must be exchanged, and the remainder replaced in their original positions. A note of the weight and position of the removed blades should be kept for possible further exchange of blades.

- (4) If the balance of the disk is not within limits after the exchange of blades, balancing weights must be added. Apply lubricant 'B' to a bolt (1-320), then assemble the bolt to the disk at the out of balance position (Ref.Fig.525), then assemble a balance weight (1-300, 1-305 or 1-310) and a nut (1-290) to the bolt. Ensure that the nut has a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m), then torque-tighten the nut between 85 and 95 lbf in. (9,6 and 10,7 N.m). Exchange or add balancing weights until the balance is within 4 drmm in. (180 grm mm). The max. number of balancing weights that can be assembled to the disk is four, maximum numbers of each weight that can be used is four off (1-300), 2 off (1-305) and 2 off (1-310).

F. Remove the Bladed Disk/Spacer Ring from the Balancing Machine.

- (1) Assemble the blade protection/retaining band (Tool 1125) to the blade tips then unscrew and remove the six nuts and washers from the adapter location pins.
- (2) Assemble the lifting fixture (Tool 365) to the spacer as detailed in para.D.1.
- (3) Raise the hoist and position the spacer/disk on to the support (Tool 1326).

G. Remove the Stage 2-3 Spacer Ring from the Stage 3 Disk, Number and Secure the Blades.

- (1) Assemble the two halves of the protector (Tool 1167) around the labyrinth of the spacer ring and secure the halves together with the clamp screws.
- (2) Unscrew and remove the slave nuts and bolts which secure the spacer to the disk.
- (3) Raise the hoist and remove the spacer from the disk. Place the spacer on a suitable work surface or pallet.
- (4) Raise the lifting fixture hand knobs, move the knobs to the 'FREE' position, depress the knobs to engage the locking holes. Raise the fixture from the spacer and lower onto a suitable surface, then release the hoist. Place the spacer in the container (Tool 1410).
- (5) Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades, then examine the blade roots for their numbering (Ref. Fig.503). Ensure that all the blades are numbered correctly in numerical sequence in a clockwise direction viewed from the rear of the disk, with No.1 blade in the datum slot. Etch all new blades with their position No., and renumber any blades that have been re-positioned, ensure that all old position No. are obliterated. On completion of the numbering, remove each blade in turn, assemble a blade key (1-340 or 1-350) to the groove in the end face of the blade, then assemble the blade/key to the disk (Ref.Fig.526).

NOTE: Ensure that the dimension from the face of the key to the peak of the ridge does not exceed 0.045 in. (1,14 mm).

PRINTED IN ENGLAND

OVERHAUL

- (6) Ensure that each blade is square in the disk slot, not loaded to one side or the other by the action of the protection/retaining band, and that the blade tang abuts the disk. Using the hammer (Tool 1655), bend the protruding end of each key inward, across the face of the disk. Care must be taken that the bend of the key is not too acute causing a fracture of the key. Using a feeler gauge, check each blade and ensure that the maximum end-float of the blade root in the disk does not exceed 0.015 in. (0,38 mm) (Ref.Fig.526).
- (7) Assemble the multiple leg sling (Tool 1217) to the disk.
  - (a) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.
  - (b) Insert four slave bolts (Tool 367) (evenly spaced) into the disk bolt holes, from underneath. Locate the sling blocks over the bolts and screw the larger thumbnuts on to the bolts.
- (8) Raise the hoist and position the disk on to a pallet then release and remove the sling and slave bolts from the disk and the sling from the hoist.

NOTE: The stage 3 bladed disk and stage 2-3 spacer ring are now ready to be passed to the LP Compressor Assembly (72-31-00, Assembly).

#### 16. Balance the Stage 4 Rotor and Stage 3-4 Spacer Ring

NOTE: The stage 4 blades should be received in the container (Tool 1398). Do not remove the blades until required for assembly.

##### A. Assemble the Stage 3-4 Spacer Ring to the Stage 4 Disk.

NOTE: The disk (2-60) should be received in the container (Tool 1407) and the spacer ring (2-30) in the container (Tool 1411).

- (1) Assemble the spacer ring (2-30) to the disk (2-60) as detailed in para.15.A. with the difference that the disk datum holes marks → 0 are on the edge of the disk not on the face, use the slave bolts (Tool 426) instead of bolts (Tool 367) (Ref.para.(3)).

B. Assemble the Blades to Stage 4 Disk.

NOTE: If all the original blades are available and undamaged then assemble the blades as detailed in para.(1). If the blades include 4 repaired and/or new blades, then the blades must be assembled as detailed in para.(2). If the blades include more than 4 repaired and/or new blades then the blades must be assembled as detailed in para.(3). Ensure that the aggregate blending depth of repaired blades does not exceed 3.200 in. (81,28 mm) (Ref.72-31-03 Repair No.6).

NOTE: The preceding information regarding repaired or new blades also applies to stage 5.

NOTE: If all the original blades are available and undamaged and are to be assembled to the original disk/spacer the bladed disk does not require balancing but the blades must be assembled to the disk with serviceable blade keys (2-50) as detailed in para.(1).

- (1) Identify the stage 4 blades (2-40), then examine the blade roots for their positional No. (Ref.Fig.503) and lay the blades out in numerical sequence. Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades. Assemble to each blade root a slave locking key (2-50) then insert the blades, in numerical sequence, into the disk, working in a clockwise direction.
- (2) Identify the stage 4 blades (2-40) then examine the roots of the original blades for their positional No. (Ref.Fig.503) and lay the blade out in numerical sequence leaving spaces where new blades are to be positioned. Noting the mass moment weight of the new blades, place the lightest new blades in vacant positions next to the heaviest original blades and position the heaviest new blades in vacant positions next to the lightest original blades. Assemble the blades to the disk as detailed in para.(1).

PRINTED IN ENGLAND

- (3) Identify the stage 4 blades (2-40), then according to the mass moment weight of the blades (quoted on the labels), lay the blades out in sequence of weight, starting with the heaviest blade and ending with the lightest. Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades. Assemble to each blade a slave locking key (2-50) then assemble the blades to the disk. Position the heaviest blade at No.1 position and the next heaviest blade diametrically opposite, then assemble the two lightest blades diametrically opposite each other and next to the heaviest blades. Assemble the remainder of the blades to the disk in sequence of weight, assembling alternate pairs of heavy and light blades and where possible, positioning equal weight blades opposite each other.
- (4) Assemble the protection/retaining band (Tool 1126) to the blade tips then invert the disk/spacer and reposition on the support. Bend each blade key inward across the face of the disk sufficient to retain the blades in the disk.

C. Assemble the Balancing Adapter and Hub to the Balancing Machine.

NOTE: The adapter and hub are used to balance stages 4-6 of the LP Compressor and may be left attached to the balancing machine after balancing stage 4.

- (1) Assemble the hub (Tool 209) to the adapter (Tool 1852) and secure with the six capscrews (Ref.Fig.527).
- (2) Assemble the six location pins (Tool 1860) to the appropriate holes in the adapter and secure with washers and nuts.

- (3) Screw a lifting eye ( $\frac{1}{2}$  in. WHIT) into the adapter hub. Attach a hoist to the lifting eye, raise the hoist and position the adapter above the balancing machine and align the holes in the hub with the spindle head of the machine. Lower the adapter on to the machine and secure the adapter with the six retaining screws (Tool 1826) then unscrew and remove the lifting eye and the washers and nuts from the adapter location pins.

D. Assemble the Bladed Disk/Spacer Ring to the Balancing Machine.

- (1) Assemble the lifting fixture (Tool 444) to the stage 3-4 spacer ring (Ref.Fig.528).
  - (a) Attach a hoist to the lifting ring of the lifting fixture, then position the hoist over the spacer.
  - (b) Ensure that the knurled nuts of the lifting fixture are unscrewed and the claws turned to align with the plate, lower the hoist and engage the locating plate of the fixture in the spacer. Turn the claws outwards to engage them under the spacer flange, then tighten the knurled nuts to lock the claws in position.
- (2) Raise the hoist and position the spacer/disk above the balancing adapter attached to the balancing machine. Align the holes in the disk with the adapter location pins then lower the spacer/disk on to the adapter.
- (3) Unscrew the knurled nuts of the lifting fixture and turn the claws inward to align with the plate. Tighten the nuts to lock the claws in position then raise the hoist and remove the lifting fixture.
- (4) Reassemble the washers and nuts to the adapter location pins to secure the disk/spacer to the adapter then remove the protection/retaining band from the blade tips.

PRINTED IN ENGLAND

OLYMPUS 593

MK.610-14-28  
OVERHAUL

E. Balance the Stage 4 Bladed Disk/Spacer Ring.

- (1) Carry out a static balance of the bladed disk, operating the balancing machine in accordance with the manufacturers instructions. The disk should be rotated as for engine rotation, counter-clockwise viewed from the rear. The balance of the disk/spacer must be within 8 drmm in. (360 grmm mm). Should the balance of the disk/spacer be outside the limit, rectify by the interchange of heavy and lightweight blades.

NOTE: If the blades are the original and labels stating the mass moment weight are not attached to the blades, two or three of the blades, from the out of balance position must be removed (noting their positions) and weighed (Ref. para.3) as must blades from the diametrically opposite position. The suitable weight blades must be exchanged, and the remainder replaced in their original positions. A note of the weight and position of the removed blades should be kept for possible further exchange of blades.

F. Remove the Bladed Disk/Spacer Ring from the Balancing Machine.

- (1) Assemble the blade protection/retaining band (Tool 1126) to the blade tips then unscrew and remove the six nuts and washers from the adapter location pins.
- (2) Assemble the lifting fixture (Tool 444) to the spacer as detailed in para.D.(1).
- (3) Raise the hoist and remove the spacer/disk from the adapter. Should it be found difficult to remove the spacer/disk from the location pins, screw four extractor bolts (5/16 UNC) into the adapter from the underside. Screw in the bolts in equal increments until the spacer/disk is released. Position the spacer/disk on the support (Tool 1326).

G. Remove the Stage 3-4 Spacer Ring from the Stage 4 Disk, Number and Secure the Blades.

- (1) Assemble the two halves of the protector (Tool 1168) around the labyrinth of the spacer ring and secure the halves together with the clamp screws.
- (2) Unscrew and remove the slave nuts and bolts which secure the spacer to the disk.
- (3) Raise the hoist and remove the spacer from the disk. Position the spacer on a suitable pallet then unscrew the lifting fixture knurled nuts and turn the claws inward to align with the plate. Tighten the nuts to lock the claws in position then raise the hoist and remove the fixture. Place the spacer in its container (Tool 1411).
- (4) Examine the edge of the disk at the blade root position and identify the position of the No.1, 2 and 3 blades, then examine the blade roots for their numbering (Ref.Fig.503). Ensure that all the blades are numbered correctly in numerical sequence in a counter-clockwise direction, viewed from the front face, with No.1 blade in the datum slot. Etch all new blades with their position No., and renumber any blades that have been repositioned, ensure that all old position Nos. are obliterated. Remove the protection/retaining band from the blade tips.
- (5) Bend the slave retaining keys upward away from the face of the disk and slide the blades down out of the disk. Remove each slave key and assemble a serviceable key blade (2-50). Reassemble the blade to the disk then using the hammer (Tool 1655) bend the protruding end of each key inward, across the face of the disk (Ref.Fig.526). Care must be taken that the bend is not too acute causing a fracture of the key. Using a feeler gauge, check each blade and ensure that the maximum end-float of the blade root in the disk does not exceed 0.015 in. (0,38 mm) then assemble the blade protection/retaining band (Tool 1126) to the blade tips.

OVERHAUL

- (6) Assemble the multiple leg sling (Tool 1217) to the disk.
- (a) Attach a hoist to the lifting ring of the sling then position the hoist over the disk.
  - (b) Insert four slave bolts (Tool 426) (evenly spaced) into the disk bolt-holes, from underneath. Locate the sling blocks over the bolts and screw the larger thumbnuts on to the bolts.
- (7) Raise the hoist and position the disk on to a pallet then release and remove the sling and slave bolts from the disk and the sling from the hoist.

NOTE: The stage 4 bladed disk and stage 3-4 spacer ring are now ready to be passed to the LP Compressor Assembly (72-31-00 Assembly).

17. Balance the Stage 5 Rotor and Stage 4-5 Spacer Ring

NOTE: The stage 5 blades should be received in the container (Tool 1399). Do not remove the blades until required for assembly.

- A. Assemble the Stage 4-5 Spacer Ring to the Stage 5 Disk.

NOTE: The disk (2-120) should be received in the container (Tool 1407) and the spacer ring in the container (Tool 1411).

- (1) Assemble the spacer ring (2-90) to the disk (2-120) as detailed in para.15.A. with the difference that the disk datum hole marks  $\rightarrow 0$  are on the edge of the disk, not on the face, and use slave bolts (Tool 426) instead of bolts (Tool 367) (Ref. para. (3)).

B. Assemble the Blades to Stage 5 Disk.

- (1) Assemble the stage 5 blades (2-100) to the disk as detailed in para.16.B. Use blade locking keys (2-110) instead of (2-50) and the protection/retaining band (Tool 1127) instead of (Tool 1126) (Ref. para. (4)).

C. Assemble the Balancing Adapter and Hub to the Balancing Adapter.

- (1) Assemble the balancing adapter and hub as detailed in para.16.C. (1) and (3).
- (2) Assemble or reposition the six location pins (Tool 1860) to the appropriate holes in the adapter and secure with washers and nuts (Ref. Fig. 527).

D. Assemble the Bladed Disk/Spacer Ring to the Balancing Machine.

- (1) Assemble the multiple leg sling (Tool 321) to the stage 4-5 spacer ring (Ref. Fig. 529).
  - (a) Attach a hoist to the lifting ring of the sling, then position the sling over the spacer.
  - (b) Ensure that the sling handknobs are loose and located at the 'UNLOCK' position, then lower the hoist and locate the sling plates in the spacer. Slide the handknobs to the 'LOCK' position, engaging the clamp plates under the spacer flange, then tighten the handknobs.
- (2) Raise the hoist and position the spacer/disk above the adapter attached to the balancing machine. Align the holes in the disk with the adapter location pins then lower the disk on to the adapter.
- (3) Release the handknobs and slide them to the 'UNLOCK' position. Raise the sling from the spacer ring and remove the sling from the hoist.
- (4) Reassemble the nuts and washers to the adapter location pins to secure the disk/spacer to the adapter.

E. Balance the Stage 5 Bladed Disk/Spacer Ring.

- (1) Balance the bladed disk/spacer ring as detailed in para.16.E. to within 8 grm in. (360 grm mm).

F. Remove the Bladed Disk/Spacer Ring from the Balancing Machine.

- (1) Assemble the blade protection/retaining band (Tool 1127) to the blade tips then unscrew and remove the six nuts and washers from the adapter location pins.
- (2) Assemble the multiple leg sling (Tool 321) to the stage 4-5 spacer ring as detailed in para.D.(1).
- (3) Raise the hoist and position the spacer/disk on to the support (Tool 1326).

G. Remove the Stage 4-5 Spacer Ring from the Stage 5 Disk, Number and Secure the Blades.

- (1) Assemble the two halves of the protector (Tool 1169) around the labyrinth of the spacer ring and secure the halves together with the clamp screws.
- (2) Unscrew and remove the slave nuts and bolts which secure the spacer to the disk.
- (3) Raise the hoist and remove the spacer from the disk. Position the spacer on a suitable pallet then unscrew the handknobs and slide them to the 'UNLOCK' position. Raise the sling from the spacer ring and remove the sling from the hoist. Place the spacer in the container (Tool 1411).
- (4) Number the blades as detailed in para.16.G.(4).
- (5) Secure the blades as detailed in para.16.G.(5) use blade keys (2-110) instead of (2-50) and the blade protection/retaining band (Tool 1127) instead of (Tool 1126).

- (6) Assemble the multiple leg sling (Tool 1217) as detailed in para.16.G.(6).
- (7) Raise the hoist and position the disk on to a pallet then release and remove and remove the sling and slave bolts from the disk and the sling from the hoist.

NOTE: The stage 5 bladed disk and stage 4-5 spacer ring are now ready to be passed to the LP Compressor Assembly (72-31-00 Assembly).

#### 18. Balance the Stage 6 Rotor and Stage 5-6 Spacer Ring

NOTE: The stage 6 blades should be received in the container (Tool 1464). Do not remove the blades until required for assembly.

##### A. Assemble the Stage 5-6 Spacer Ring to the Stage 6 Disk.

NOTE: The disk (2-180) should be received in the container (Tool 1407) and the spacer ring (2-150) in the container (Tool 1411).

- (1) Assemble the spacer ring (2-150) to the disk (2-180) as detailed in para.15.A. with the difference that the disk datum holes marks O are on the edge of the disk, not on the face, use the slave bolts (Tool 368) instead of bolts (Tool 367) (Ref.para.(3)).

##### B. Assemble the Blades to Stage 6 Disk.

- (1) Assemble the stage 6 blades (2-160) to the disk as detailed in para.16.B. Use blade locking keys (2-170) instead of (2-50) and the protection/retaining band (Tool 1128) instead of (Tool 1126) (Ref.para.(4)).

NOTE: Ensure that the aggregate blending depth of repaired blades does not exceed 2.000 in. (50,8 mm) (Ref.72-31-03 Repair No.6).

##### C. Assemble the Balancing Adapter and Hub to the Balancing Machine.

- (1) Assemble the balancing adapter and hub as detailed in para.16.C. Use location pins (Tool 1859) instead of (Tool 1860) (Ref.Fig.527).

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- D. Assemble the Bladed Disk/Spacer Ring to the Balancing Machine.
- (1) Assemble the bladed disk/spacer ring to the balancing machine as detailed in para.17.D.
- E. Balance the Stage 6 Bladed Disk/Spacer Ring.
- (1) Balance the bladed disk/spacer ring as detailed in para.16.E. to within 8 drn in. (360 grm mm).
- F. Remove the Bladed Disk/Spacer Ring from the Balancing Machine.
- (1) Remove the bladed disk/spacer ring from the balancing machine as detailed in para.17.F. Use the blade protection/retaining band (Tool 1128) instead of (Tool 1127).
- G. Remove the Stage 5-6 Spacer Ring from the Stage 6 Disk, Number and Secure the Blades.
- (1) Remove the spacer from the disk as detailed in para.17.G. (1) to (3) use the protector (Tool 1169). Number and secure the blades as detailed in para.16.G. (5) to (7) use blade keys (2-170) instead of (2-50) and slave bolts (Tool 368) instead of (Tool 426) (Ref.para.(6)).

NOTE: The stage 6 bladed disk and stage 5-6 spacer ring are now ready to be passed to the LP Compressor Assembly (72-31-00 Assembly).

19. Balance the Stage 7 Rotor and Stage 6-7 Spacer Ring

NOTE: The stage 7 blades should be received in the container (Tool 1465). Do not remove the blades until required for assembly.

OVERHAUL

A. Assemble the Stage 6-7 Spacer Ring to the Stage 7 Disk.

NOTE: The disk (3-340) should be received in the container (Tool 1406) and the spacer ring (3-270) in the container (Tool 1410).

- (1) Assemble the spacer ring (3-270) to the disk (3-340) as detailed in para.15.A. with the difference that the disk datum marks O are on the edge of the disk, not on the face. Use the slave bolts (Tool 1164) instead of bolts (Tool 367).

B. Assemble the Blades to Stage 7 Disk.

- (1) Assemble the stage 7 blades (3-320) to the disk as detailed in para.16.B. Use blade locking keys (3-330) instead of keys (2-50) and the protection/retaining band (Tool 1129) (Ref. para. (4)).

NOTE: Ensure that the aggregate blending depth of repaired blades does not exceed 2.000 in. (50,8 mm) (Ref.72-31-03 Repair No.6).

C. Assemble the Balancing Adapter to the Balancing Machine.

- (1) Align the holes of the adapter hub (Tool 1856) with those of the spindle head of the machine. Lower the adapter on to the machine then secure the adapter with the six retaining screws (Tool 1826).
- (2) Unscrew and remove the six washers and nuts from adapter location pins.

D. Assemble the Bladed Disk/Spacer Ring to the Balancing Machine.

- (1) Assemble the bladed disk/spacer ring to the balancing machine as detailed in para.17.D.

E. Balance the Stage 7 Bladed Disk/Spacer Ring.

- (1) Balance the bladed disk/spacer ring as detailed in para.16.E. to within 4 drn in. (180 grm mm).

OLYMPUS 593

MK.610-14-28  
OVERHAUL

F. Remove the Bladed Disk/Spacer Ring from the Balancing Machine.

- (1) Remove the bladed disk/spacer ring from the balancing machine as detailed in para.17.F. Use the blade protection/retaining band (Tool 1129) instead of (Tool 1127).

G. Remove the Stage 6-7 Spacer Ring from the Stage 7 Disk, Number and Secure the Blades.

- (1) Remove the spacer from the disk, number and secure the blades as detailed in para.16.G. Use labyrinth protector (Tool 1170) instead of (Tool 1168). Use blade keys (3-330) instead of (Tool 2-50) and slave bolts (Tool 1164) instead of (Tool 426).

NOTE: The stage 7 bladed disk and stage 6-7 spacer ring are now ready to be passed to the LP Compressor Assembly (72-31-00).

20. Assemble the Spherical Mounting and Sleeve Housing to the Rotor Shaft Rear (Ref.Fig.530)

A. Prepare the Rotor Shaft Rear.

- (1) Rest the rear end (smaller threaded diameter) of the rotor shaft on a clean, flat surface. Examine the inner internal flange to ensure that the four shouldered locating pins (3-200) are assembled to the flange and the shoulders are below the surface of the flange. If the pins are not assembled, place the pins in Cardice for (approx.) 20 minutes or liquid Nitrogen for (approx.) 2-3 minutes. On completion of the cooling period, remove the pins from the freezing agent and assemble them to the internal flange, ensuring that the shoulders are below the surface of the flange.

SUB-ASSEMBLY

SNECMA

## B. Assemble Items to the Rotor Shaft Rear.

- (1) Lower the spherical mounting (3-220) into the bore of the rotor shaft, so that the flange of the mounting is uppermost and rests on a step in the shaft.
- (2) Identify the offset pin in the rotor shaft and the offset pin hole in the sleeve housing, then assemble the seal (3-210) to the shoulder on the sleeve housing.
- (3) Assemble the sleeve housing/seal to the rotor shaft, ensuring that the seal remains on the housing, and taking care to ease the seal into the recess in the shaft and align the offset locating pin and hole. Ensure that the sleeve housing is correctly assembled to the pins and abuts the shaft.
- (4) Apply lubricant 'B' to the bolts (3-180), then insert the bolts into the sleeve mounting and screw them into the rotor shaft, ensuring that the bolts have a locking (run-down) torque between 3 and 10 lbf in. (0,3 and 1,1 N.m). Torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m). After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 1.5 thread pitches beyond nut chamfer, the bolt must be renewed (Ref.SB.72-8449-191).
- (5) Turn the rotor shaft onto its front face, then check that the spherical mounting rotates freely. Using a suitable depth gauge or dial indicator, check that the spherical mounting has end-float of at least 0.002 in. (0,05 mm).

NOTE: The rotor shaft rear assembly is now ready to be passed to the LP Compressor Drive Shaft (Ref. 72-31-04, Assembly) for dimensional checks, prior to being assembled to the LP Compressor Assembly (72-31-00, Assembly).

LP COMPRESSOR DRIVE SHAFT - SUB-ASSEMBLY

1. General

- A. Prior to commencing assembly, refer to 72-09-00 Assembly for general information.
- B. During the sub-assembly procedure, reference will be made to the Illustrated Parts Catalogue (I.P.C.) to identify those items where the nomenclature does not positively identify them, due to duplication of the title e.g. nuts, bolts, washers, bearings, gears, housings, tubes etc. When the item is a part of the breakdown of the text concerned, the item will be identified e.g. bolt (1-10), the 1 referring to the I.P.C. Fig. No., and the 10 referring to the Item No. Where items from a different breakdown are introduced, then the breakdown number will be quoted in addition e.g., bolt (72-32-01/1-10).
- C. Throughout the text special tools are quoted by their Ref. No. e.g., (Tool 1234). For a complete list of tooling required for the assembly and balance procedures, and for the Manufacturers Part No., refer to the Special Tools, Fixtures and Equipment Tables 1002, 1003 and 1004.
- D. This chapter deals with the assembly and balancing of the LP compressor drive shaft, and the assembly of the LP signal shaft tube. In addition, certain dimensional checks must be carried out which entail the use of the LP compressor rotor shaft rear. To enable the checks to be carried out, the rotor shaft rear must be borrowed from the LP compressor assembly during its assembly (Ref.72-31-00 Assembly) and assembled and locked to the drive shaft. Certain dimensional checks are carried out between the rotor shaft and the rotor shaft rear, followed by additional dimensional checks and setting up, for determining the adjusting washer thickness for setting up the engine signal system. The signal system items are from 72-31-05.

- E. On completion of the checks, the LP compressor rotor shaft rear must be returned to the LP compressor assembly, and the signal system items (that were used), returned to the remainder of the system items ready for engine build. The LP signal shaft tube is ready for engine build, and the LP compressor drive shaft is ready for assembling to the HP compressor assembly during its assembly (Ref.72-33-00 Assembly).

2. Assemble the LP Compressor Drive Shaft

A. Assemble the Stiffening Disk Assembly to the Drive Shaft Front.

- (1) If the carbon bearings (1-200) were removed for stiffening disk cleaning procedures install as detailed in para.7.
- (2) Apply lubricant 'A' to bolts (1-170), then assemble the bolts to the rear face of the front (smaller) disk of the stiffening disk assembly (Ref.Fig.501). Position the carbon bearing retaining plate (1-180) on the front face of the disk and locate on the bolts. Secure retaining plate with nuts (1-160), check that the run-down torque is not less than 10 lbf in. (1,1 N.m), then torque-tighten nuts to 100 lbf in. (11,5 N.m).
- (3) Rest the retainer pad (Tool 89) (Ref.Fig.501) on the centre of the upper disk of the disk assembly. Ensure that the three bolts of the disk retainer (Tool 88) are unscrewed, then position the retainer on top of the disk, turn the retainer to engage its three arms behind the lugs on the disk, then screw in the three bolts finger-tight onto the retainer pad.

NOTE: The disk retainer and pad prevent the upper disk from dishing, after assembly to the shaft front, and, by acting against its flange, lifting the other disks from their locations.

- (4) Locate the lifting fixture (Tool 1109) on the rear flange of the drive shaft and secure the fixture to the shaft with slave bolts (Tool 328) and nuts.

OVERHAUL

- (5) Employ one of the two methods of heating the drive shaft to attain a temperature of between 300 - 320 deg C.

METHOD 1. Local heating of the areas where the disks locate. The procedure requires special equipment and temperature monitoring to ensure that the shaft is not over-temperatured. This is a Controlled Manufacturing Technique (C.M.T.) procedure and must be followed without deviation.

METHOD 2. Complete heating in a thermostatically controlled oven. This procedure poses a handling problem in ensuring that the stiffening disk assembly is fully inserted before the temperature difference between the shaft and disk assembly is lost.

- (6) Prepare and heat the shaft method 1.

- (a) Attach a hoist to the lifting fixture then raise the drive shaft and lower into the build stand (Tool 1110).
- (b) At the five positions where heat will be applied (Ref.Fig.501) ensure that the shaft surface is adequately degreased then apply, by brushing, a thin coat of Thermindex temperature sensitive paint ref. O/E 106 in bands 0.5 to 1 in. (12,7 to 25,4 mm) wide. Allow the paint to dry at room temperature for 2 hours.

NOTE: It may be necessary to raise the shaft a few inches on the hoist to expose the second band from the lower end for painting.

- (c) Lift the shaft clear of the build stand and position it over the mobile stand (Tool 1253) (Ref.Fig.502). Lower the shaft into the mobile stand, guiding it through the top bush and locating the bottom (front) of the shaft in the lower bush. Release the hoist, then release and remove the lifting fixture. Engage and lock the three plungers against the shaft.

**WARNING:** DURING THE OPERATION OF THE DELAPENA EQUIPMENT THE HEATING COILS AND LP DRIVE SHAFT MUST NOT BE TOUCHED.

- (d) Position the induction heating coils of a Delapena type 6 30/50 in a supporting frame at the positions shown in Fig.501 and secure the frame to the mobile stand (Ref. Fig.502). Operate the equipment in accordance with the manufacturers instructions, and for the time and at the power quoted as follows:
- (i) With the equipment connected to the main electrical supply, switch the mains supply on and check that the 'MAINS ON' bulb lights up.
  - (ii) With the equipment connected to a mains water supply, turn on the water supply and check that the 'WATER ON' bulb lights up.
  - (iii) When the 'MAINS ON' bulb brightens, the equipment is ready to operate. Operate the starter switch on the control box and check the reading on the ANODE CURRENT dial, then operate the stop switch. The current required is 4 amps and adjustment must be made by moving the handle of the 'POWER CONTROL' until 4 amps is registering when the starter switch is operated.
  - (iv) When the current is correct, set the timer switch to 82 seconds.
  - (v) Operate the starter switch and check that the 'HEAT ON' bulb lights up and the seconds light flashes each second. After 82 seconds the heating operation will automatically stop, the 'HEAT ON' bulb will go out and the seconds light will cease to flash. Operate the stop switch, then turn off the mains supply. The stiffener may now be assembled to the LP drive shaft front, (Ref.para.(8)), and any delay must be avoided.

OVERHAUL

(vi) If the loss of temperature difference prevents the disks from locating correctly on their lands the disk assembly must be extracted as detailed in 72-31-04 Disassembly and the assembly procedure restarted. The shaft must be permitted to cool to room temperature before the heating process is repeated to prevent oven temperature.

(7) METHOD 2 - Prepare and heat the shaft.

(a) With the mobile stand (Tool 590) (Ref.Fig.503) set in the vertical position and with the rear clamp open, use a hoist on the lifting fixture to position the shaft with its forward end in the front (bottom) mounting of the stand, then close and fasten the rear clamp around the shaft. Remove the hoist, release and remove the lifting fixture, then with the stand set horizontally wheel the stand into an oven set between 300-320 deg C, and heat for 1 hour. Using protective gloves, remove the stand from the oven, elevate the stand to the intermediate position, lower the stand legs, then assemble the stiffening disk assembly (Ref.para.(8)). If the oven will not accommodate the stand, the shaft will have to be transferred to and from the oven on a hoist, taking care to minimise the cooling period before assembling the stiffening disk assembly (Ref.para.(8)).

WARNING: THE SHAFT AND STAND REMAIN HOT FOR ABOUT 2 HOURS AFTER REMOVAL FROM THE OVEN. PRECAUTIONS MUST BE TAKEN TO PREVENT ACCIDENTAL HANDLING DURING THIS PERIOD.

(b) If the loss of temperature difference prevents the disks from locating correctly on their lands the disk assembly must be extracted as detailed in 72-31-04 Disassembly and the assembly procedure restarted.

OVERHAUL

- (8) Lower the stiffening disk assembly into the drive shaft front until the disks abut the steps inside the shaft, then ensure that the stiffening disk is correctly assembled by checking that the protrusion of the upper (rear) disk is not more than approx. 0.040 in. (1 mm) (Ref.Fig.501).
- (9) If the shaft was heated locally, check that the temperature paint has changed colour to black, and has not undergone a further change to an off white colour. If the off white colour appears anywhere on the temperature paint the shaft must be rejected and referred for metallurgical examination.
- (10) When the drive shaft has cooled to the workshop temperature, release and remove the disk retainer and pad. Attach the lifting fixture (Tool 1109) to the shaft with slave bolts (Tool 328), and with a hoist, remove the shaft from the mobile stand and lower it into the build stand (Tool 1110).
- (11) Release and remove the hoist and lifting fixture. Remove the temperature paint (if used) by wiping with a lint-free cloth soaked in cellosolve acetate, then touch up the aluminium paint where necessary (Ref. 72-09-00 Repair).
- (12) Apply lubricant 'A' to bolts (1-90), then position the carbon bearing retaining plate (1-100) on the rear disk extension and assemble the bolts from the front face of the extension through the plate and secure with nuts (1-80). Check that the run-down torque is not less than 10 lbf in. (1,1 N.m), then torque-tighten the nuts to 100 lbf in. (11,5 N.m).

B. Assemble the Drive Shaft Rear to the Drive Shaft Front.

**NOTE:** Stiffened drive shaft front and rear to SB.72-98 are separately interchangeable with front and rear shafts pre SB.72-98.

SUB-ASSEMBLY

**72-31-04**

Page 509

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (1) Screw the lifting fixture (Tool 1055) onto the rear end of the drive shaft rear. Attach a hoist to the lifting fixture, then position the shaft over the drive shaft front. Examine the flanges of the drive shaft front and rear for etched datum marks 00 on the flange faces alongside one mating pair of bolt-holes, and/or 0 on their peripheries. If the datum marks are not evident, align the external master spline at the end of each shaft with one another. Lower the drive shaft rear onto the drive shaft front aligning the bolt-holes, and ensuring the datum marks and/or the master splines are aligned.
  - (2) Apply lubricant 'A' to bolts (1-150) then assemble the bolts through the flange of the drive shaft front (from underneath), position the balancing washers (1-130 and 1-140) on the bolts with heavy washers and light washers alternating, and secure with nuts (1-120). Release the hoist from the lifting fixture. Taking the bolt in line with the datum marks and/or master splines as No.1 bolt, and viewing from the rear (above), tighten the nuts in the following sequence 1, 19, 10, 28, 4, 22, 13, 31, 16, 34, 7, 25, 12, 30, 3, 21, 27, 9, 18, 36, 5, 23, 15, 33, 11, 29, 2, 20, 8, 26, 35, 17, 6, 24, 14 and 32, checking that that the nuts have a run-down torque of not less than 9.5 lbf in. (1,1 N.m). Torque-tighten the nuts in 50 lbf in. (5,6 N.m) increments to a final torque of 450 lbf in. (51 N.m). If datum marks were not present on the shaft(s), etch datum marks 00 on the flange faces and 0 on the peripheries of the flanges in line with an existing datum mark, or with the master splines at each end of the shafts.
- C. Assemble the Sealing Ring Outer and Spacer to the Drive Shaft.
- (1) Attach a hoist to the lifting fixture, then steadily raise the hoist and guide the drive shaft out of the stand. Assemble the lifting fixture (Tool 1068) (Ref.Fig.504) to the front end of the drive shaft front as follows:

SUB-ASSEMBLY

**72-31-04**

Page 510

Oct 1/82

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (a) Unscrew the locknut and withdraw the keep plate from the four body pins and towards the lifting plate.
- (b) Offer the fixture to the drive shaft and slide the four lobes of the body through the four cut-aways in the shaft, then turn the body so that the lobes locate behind the lands in the shaft. Push the keep plate towards the shaft locating the two lobes in two of the cut-aways in the shaft and over the four pins of the body. Screw on the locknut and tighten it against the keep plate.
- (2) Attach a hoist to the lifting fixture on the drive shaft front, then raise the shaft to the horizontal position. Position the mobile stand (Tool 1332) (Ref.Fig.507) or (Tool 589) under the drive shaft with the locking end of the stand at the front end of the drive shaft assembly. With the stand hinge bushes open, lower the drive shaft onto the stand bushes. Hinge the bushes closed and secure them with the knurled nuts. Release the hoists from the lifting fixtures, then unscrew and remove the lifting fixture from the drive shaft rear. Remove the lifting fixture from the drive shaft front by releasing the locknut, withdrawing the keep plate, then turning the body until its lobes align with the cut-aways in the shaft, withdraw the body.
- (3) Offer the sealing ring outer over the front of the drive shaft front, and assemble to the shaft flange (Ref.Fig.508). Align the bolt-holes of the two items by temporarily inserting two of the balancing bolts (1-50) in diametrically opposite holes. Lubricate bolts (1-60) with lubricant 'A', then assemble bolts to the front of the sealing ring and secure with nuts (1-10). Remove the two balancing bolts and assemble the correct bolts (1-60) and nuts (1-10). Check that the run-down torque is not less than 10 lbf in. (1,1 N.m), then torque-tighten nuts to 100 lbf in. (11,5 N.m).

- (4) Assemble the sleeve to the drive shaft.
- (a) Check that the sealing rings (2-180) will assemble into the sleeve (2-170) and then remove them.
  - (b) Place the sleeve in a freezing agent Cardice for approx. 20 min, or liquid Nitrogen for approx. 2 to 3 min.
  - (c) Remove the sleeve from the freezing agent and assemble the sleeve to the bore of the drive shaft rear, ensuring the smaller diameter end of the sleeve enters first. Using a suitable light alloy drift, ensure the sleeve abuts the step in the shaft.
  - (d) If it becomes necessary to remove the sleeve due to incorrect assembly or accidental damage, extract the sleeve from the shaft using mechanical puller (Tool 1305) (Ref.Fig.505) as follows:
    - (i) Screw in on the small tommy bar until the cone is out of engagement with the three claws, allowing them to retract under the action of the springs.
    - (ii) Unscrew the large tommy bar to move the claw assembly away from the handle.
    - (iii) Slide the claw assembly into the drive shaft rear until the flange on the claw cover plate abuts the spacer.
    - (iv) Hold the knurled ring and screw out on the small tommy bar causing the cone to extend the claws behind the sleeve.

- (v) Screw in on the large tommy bar and engage the plate in the shaft, then continue screwing, holding the knurled ring steady, until the spacer is released.
- (vi) Withdraw the puller and spacer from the shaft. Screw in on the small tommy bar to retract the claws, then withdraw the spacer from the puller.
- (5) Using fine emery cloth, remove the aluminium paint from the rotor shaft at the balancing positions 'A' and 'G' (Ref.Fig.508). Ensure that no paint remains on the shaft at the balancing positions.
- (6) Slide the protector (Tool 408) onto the end of the drive shaft rear, and assemble the (split) protector (Tool 999) to the drive shaft front to protect the splines and labyrinth. Secure the protector with its thumbnut.
3. Carry Out Concentricity and Balancing Checks on the LP Compressor Drive Shaft
- A. Carry Out Concentricity Checks on the Drive Shaft (Ref.Fig.508 and 509).
- NOTE: Depending on the availability of equipment, the concentricity checks may be carried out on the balancing machine (prior to balancing) in lieu of the surface table and equipment.
- (1) Prepare the equipment for checking the concentricity.
- (a) Position two supports (Tool 1073) on the surface table.
- (b) Assemble a spacer (Tool 1074) to each of the supports, then assemble clamp plates to each support to secure the spacers.

- (2) Assemble the lifting equipment to the drive shaft (Ref.Fig.507).
- (a) Release and open the front adapter (Tool 1143), then assemble the adapter to the drive shaft front ensuring that the taper in the bushes abuts the increased dia. taper on the shaft. Close the adapter and secure with the knurled pin.
  - (b) Release and open the rear adapter (Tool 1144), then assemble the adapter to the drive shaft rear ensuring that the taper on the bushes abuts the increased dia. taper on the shaft. Close the adapter and secure with the knurled pin.
  - (c) Attach a hoist to the (beam type) sling (Tool 1145) centre shackle, then position the sling over the drive shaft aligning the connecting points with the correct adapters as quoted on the sling. Secure the sling to the adapters with quick release pins.
- (3) Assemble the drive shaft to the surface table equipment.
- (a) Release the knurled nuts and hinge the mobile stand bushes open.
  - (b) Raise the hoist and position the drive shaft over the supports on the surface table, positioning the drive shaft front over the adjustable bearing fitted with the locating arm. Position the supports to align with location 'A' on the drive shaft front (Ref.Fig.508), and location 'G' on drive shaft rear (Ref.Fig.508). Secure the supports to the surface table.
  - (c) Lower the drive shaft, locating the lip on the drive shaft front in the recess in the locating arm of the front adjustable bearing, and resting the shaft on the two bearings.

- (d) Release the knurled pins securing the adapters to the drive shaft, then remove the sling and adapters from the shaft. Withdraw the protector from the end of the drive shaft rear.
- (4) Check and record the concentricity at eight equi-spaced points at positions 'E', 'C' and 'H' using a suitable dial gauge and stand. The amount of eccentricity must be within a total indicator reading of 0.001 in. (0,025 mm) at positions 'E' and 'H', and 0.005 in. (0,127 mm) at 'C'.

NOTE: Use the datum marks on the drive shaft front and rear as the common angular datum line for the concentricity checks.

- (5) Slide the protector (Tool 408) onto the end of the drive shaft rear. Position the hoist with attached (beam type) sling (Tool 1145) and adapters over the drive shaft, then assemble the rear adapter (Tool 1144) to the drive shaft rear, and the front adapter (Tool 1143) to the drive shaft front. Secure each adapter with its knurled pin.
- (6) If the surface table is required for other use, or the supports and adjustable bearings are required for balancing, hoist the drive shaft from the surface table and position and lower the drive shaft into the mobile stand (Tool 1332 or 589) or transporter (Tool 1092). If required, release the keep plates and remove the bearings and spacers from the supports, then release and remove the supports from the surface table.

B. Dynamically Balance the Drive Shaft.

- (1) Prepare the balancing machine (Avery 72N56) (Ref. Fig.509).
- (a) Assemble a spacer (Tool 1074) to each of the machine cradles, then assemble clamp plates to each cradle to secure the spacers.

- (f) Assemble a tie bar bracket (Tool 109) to the top position on the front and rear faces of each cradle (Ref.Fig.509) and secure each bracket with four bolts or Allen screws. Ensure the hand-nuts on the brackets are loose, then slide a tie bar (Tool 212) into each pair of front and rear brackets. Do not lock the tie bars at this stage.
- (2) Assemble the drive shaft to the balancing machine.
- (a) With the (beam type) sling (Tool 1145) and adapters assembled to the drive shaft, and a hoist connected to the sling, raise the drive shaft from the surface table supports or the mobile/transporter stand and position the drive shaft over the balancing machine. Align the 'A' location on the drive shaft front (Ref. Fig.508) with the adjustable bearing fitted with the locating arm, then position and secure the cradle(s) to align the 'G' location on the drive shaft rear (Ref.Fig.508) with the other adjustable bearing. Lower the drive shaft locating the lip on the drive shaft front in the recess in the locating arm of the front adjustable bearing and resting the shaft on the two bearings.
- (b) Release the knurled pins securing the adapters to the drive shaft, then remove the sling and adapters from the shaft. Lower the sling onto a suitable surface, then release the hoist.
- (c) Position the tie bars evenly in the brackets, then secure the bars with the bracket handnuts.
- (d) Move the belt from around the cradle and position it on the shaft at diameter 'B' (Ref.Fig.508). Align the motor and rollers with the belt, assemble the belt to the motor/rollers and adjust as necessary to operate correctly, then secure the motor/rollers.

- (e) Attach a strip of black adhesive tape around the drive shaft at a suitable position for the scanning head. Starting in line with the datum marks on the attachment flange of the shafts attach a tape of contrasting colour (e.g. white or yellow) over the black tape for 180° of the shaft travel to act as a datum for balancing.
- (f) Release and remove the protector from the front of the drive shaft front, and withdraw the protector from the drive shaft rear.
- (3) Prepare the machine for balancing in accordance with the manufacturers instructions, setting up the pick-ups, nodal bar, pick-up wires and scanning head etc.
- (4) Balance the drive shaft (Ref.Fig.508).

NOTE: If the concentricity checks have not been carried out previously, carry out the checks at this stage (prior to balancing) by mounting the dial gauge holder on the cradle and the bed, and checking that the amounts of eccentricity are within the dimensions quoted in para.A.(4).

- (a) Apply lubricant 'A' to the spindles of the roller bearings and to the shaft journals, and ensure that the bearings/shaft are well lubricated, and remain so throughout the balancing operation.
- (b) Operate the balancing machine to give a shaft speed of 600 rpm (approx.) and run for 3 to 5 min to allow the temperature to stabilise. Calibrate the balancing machine in accordance with manufacturers instructions, then check the initial unbalance. If the initial unbalance exceeds 30 drmm in. (1350 g mm) in plane 'F' or 50 drmm in. (2250 g mm) in plane 'R' the cause must be determined and rectified before balancing may proceed.

SUB-ASSEMBLY

**72-31-04**

Page 525

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (i) Ensure that no malalignment exists between the supports, bearings and cradles, and that the adjustable bearing rollers have been set correctly.
  - (ii) Ensure that the tie bars are correctly positioned in their brackets.
  - (iii) Ensure that no protective finish has been left on the drive shaft, which would cause picking up and/or overheating.
  - (iv) Ensure that the bearings are well lubricated.
  - (v) If the preceding (i) to (iv) are satisfactory, remove the drive shaft from the balancing machine, separate the rear shaft from the front, assemble an alternative rear shaft, then recheck the initial balance. As an alternative, or in addition to exchanging the rear shaft, the stiffening disk in the shaft front may be removed and replaced at a different angular orientation. When a shaft is assembled with acceptable initial balance, etch new datum marks on the rear shaft and cancel the original datum marks (if necessary) (ref. para.B.(4)).
- (c) With the initial unbalance within limits, balance the LP drive shaft at a shaft speed of 600 rpm (approx.) ensuring that the temperature has stabilised by running for 3-5 min before taking readings.
- (i) Balance the front end of the shaft to within 2 drn in. (90 g mm) using balance weights (Ref. Table 501) secured to the flange with the longer bolts (1-50) and nuts with lubricant 'A' applied. Torque-tighten to 100 lbf in. (11,5 N.m) checking that the run-down torque is not less than 10 lbf in. (1,1 N.m).

SUB-ASSEMBLY

OVERHAUL

ITEM	IPC REF.	WEIGHT
Balance weight	1-20	6 drn
Balance weight	1-25	6.5 drn
Balance weight	1-30	7 drn
Balance weight	1-35	7.5 drn
Balance weight	1-40 (SB.72-100)	2 drn
Balance weight	1-45 (SB.72-100)	4 drn
Bolt	1-50	1 drn (1,77 g) more than bolt (1-60)

Balance Weights for Shaft Front End  
Table 301

- (ii) Balance the rear end of the shaft to within 2 drn in. (90 g mm) by interchanging light and heavy washers. The difference in weight between one heavy and one light washer is 1 drn (1,77 g) and the radius approx. 5 in. A range of adjustment is thus available by the exchange of pairs of light washers with pairs of heavy washers (Ref.Fig.510). The effect on the balance of exchanging pairs of washers at various positions in relation to the diameter joining light and heavy positions is given for guidance in Fig.510. Torque-tighten the securing nuts affected to 450 lbf in. (51 N.m) checking that the run-down torque is not less than 9.5 lbf in. (1,1 N.m).
- (iii) Check that the balance at the front of the shaft is still within 2 drn in. (90 g mm) and rectify if necessary (Ref. para.(1)).

OVERHAUL

- (iv) Check that the balance at the rear of the shaft is still within 2 drn in. (90 g mm) if rectification was necessary in para.(iii), and correct if necessary (Ref. para.(ii)). Continue checking alternate ends until both are within 2 drn in. without rectification.
- (v) Ensure that the nuts on the rear end bolts (securing the shaft front to rear) are torque-tightened to 450 lbf in. (51 N.m) and that the front end bolts are torque-tightened to 100 lbf in. (11,5 N.m) and that the curvature of the larger balance weights aligns with the curvature of the sealing ring outer.
- (vi) Record the angle and amount of unbalance at the front and rear ends of the shaft, reading the angles in a clockwise direction from the rear with the datum marks as zero.
- (5) On completion of the balancing, remove the drive shaft from the balancing machine.
- (a) Release the belt and place over a cradle.
- (b) Slide the protector (Tool 408) onto the end of the drive shaft rear, then assemble the (split) protection (Tool 999) to the drive shaft front (to protect the splines and labyrinth), and secure the protector with its thumbnut.
- (c) Attach a hoist to the (beam type) sling (Tool 1145) (with attached adapters Ref.Fig.507) and position over the drive shaft, then assemble the rear adapter (Tool 1144) to the drive shaft rear, and front adapter (Tool 1143) to the drive shaft front. Secure each adapter (around the shafts) with its knurled pin.

SUB-ASSEMBLY

72-31-04

Page 529

OVERHAUL

- (d) Raise the hoist and position the drive shaft over the mobile stand (Tool 1332) (Ref.Fig.507) or (Tool 589) with the locking end of the stand at the front end of the drive shaft assembly. With the stand hinge bushes open, lower the drive shaft onto the stand bushes. Hinge the bushes closed and secure them with the knurled nuts.
  - (e) Release the knurled pins securing the adapters to the drive shaft, then remove the sling and adapters from the shaft. Release and remove the adapters from the sling, then remove the equipment from the hoist.
  - (f) Carry out a 'touch-up' procedure for high temperature aluminium paint as detailed in 72-09-00 Repair to the areas on the drive shaft cleaned of paint to provide the bearing journals for balancing.
- (6) Remove the balancing equipment from the balancing machine.

NOTE: The equipment need only be removed if the balancing machine is required for a different assembly, or the bearings/spacers are required for another function.

- (a) Release the keep plates and remove the adjustable bearings and spacers from the two cradles.
- (b) Remove the belt from around the cradle.

#### 4. Assemble the LP Signal Shaft Tube

##### A. Assemble the Seal Ring Pack to the Signal Shaft Tube.

- (1) Ensure that the seven rings of the seal ring pack (2-180) are serviceable and clean, then ensure that the three inward acting (smaller diameter) rings are interposed between the four outward acting (larger diameter) rings.

SUB-ASSEMBLY

**72-31-04**

Page 530

Oct 1/76

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (2) Offer the rings (in sequence) over the front end of the signal shaft (2-190), then slide them to the rear end, locating them in the recess next to the flange.
- (3) Ensure that the rings are not intertwined, that they can be turned, and the gaps in the rings are disposed around the shaft and do not align with one another.
- B. Assemble the Locking and Serrated Sleeves to the Signal Shaft Tube (Ref.Fig.511).
- (1) Slide the locking sleeve (2-160) over the front end of the signal shaft, then slide the serrated sleeve (2-150) on the shaft aligning the master splines of the serrated sleeve and shaft.
- (2) Assemble the locking washer (2-140) to the inside of the serrated sleeve, then apply lubricant 'A' to the threads of the screwed plug (2-130) and screw the plug into the shaft.
- (3) Locate the vice holder (Tool 1301) in a hand vice and secure the holder, then insert the serrated sleeve into the holder. Using spanner (Tool 1614), torque-tighten the screwed plug to 530 lbf in. (60 N.m). Remove the spanner, then lock the locking washer. Remove the serrated sleeve from the holder and the holder from the vice.
- (4) Using feeler gauges, check that the end-float between the locking sleeve and serrated sleeve is between 0.001 and 0.006 in. (0,025 and 0,152 mm). Record the end-float.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

5. Trial Assembly and Dimensional Checks of the Rotor Shaft Rear/  
Spherical Mounting, the LP Compressor Drive Shaft and the  
LP Signal Shaft Tube

NOTE: To carry out this check the rotor shaft rear must be removed from its build station (Ref.72-31-00 Assembly) before it is built into the LP compressor assembly final build, but after it has had the spherical mounting and sleeve housing assembled to it.

A. Assemble and Lock the Rotor Shaft Rear to the Drive Shaft (Ref.Fig.511).

(1) Correctly position the spherical mounting in relation to the rotor shaft rear, ready for engagement with the LP compressor drive shaft.

(a) Insert the alignment tool (Tool 610) into the rear end of the rotor shaft rear, view through the sight hole in the tool and align the master splines in the end of the tool with the spherical mounting, then push the tool into the mounting.

(b) Turning the tool as necessary, align the master spline in the tool with the master spline in the rotor shaft rear, then engage the tool splines in the rotor splines.

(c) Withdraw the setting tool ensuring it is not turned. The master splines in the spherical mounting and rotor shaft rear will now be offset by 45 deg.

NOTE: To assist in aligning the master splines of the rotor shaft rear and the signal tube, mark (with chalk) on the outside diameter of the rotor shaft rear, the position of its master spline.

SUB-ASSEMBLY

**72-31-04**

Page 532

OVERHAUL

Assembling and Locking of LP Rotor Shaft Rear to  
LP Drive Shaft  
Figure 511

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (2) Withdraw the protector from the rear end of the drive shaft, then release and remove the protector from the front end of the shaft. Ascertain the positions of the master splines in the rotor shaft rear and the external splines on the front end of the drive shaft, then offer the rotor shaft to the drive shaft and engage the master splines. Push the rotor shaft on to the drive shaft until the spherical mounting abuts a shoulder inside the drive shaft. Withdraw the rotor shaft approx. 0.430 in. (10,9 mm).

NOTE: To lock the rotor shaft rear to the drive shaft, the spherical mounting must be turned to engage its dogs with those on the shaft. In this position the master splines on the spherical joint, the drive shaft and the sleeve housing are aligned to turn the spherical mounting. A slave locking tube (Tool 579) is used. Having locked the drive shaft to the rotor shaft rear, the slave tube is removed and the engine signal tube assembled for the dimensional checks. If the slave locking tube is not available, the engine signal tube may be used as detailed for the slave tube, with the exception that the split guide sleeves must be removed before the tube is pushed fully in, and having turned the spherical mounting, the tube must be aligned with the sleeve housing master splines and the tube pushed fully into the housing.

- (3) Assemble the split sleeves (Tool 609) into the rear end of the drive shaft. Remove the slave locking tube (Tool 579) from its container (Tool 580) and locate in the split sleeves, then slide the tube into the drive shaft, taking care not to damage the carbon bearings inside the drive shaft. With the flange of the slave tube approx. 6 in. (150 mm) from the end of the drive shaft, align the 'LOCKED' mark on the slave tube flange with the master spline on the drive shaft and/or rotor shaft rear.

NOTE: The master spline on the slave locking tube is in line with the 'LOCKED' mark on the flange.

TN35021

SUB-ASSEMBLY

**72-31-04**

Page 534

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (4) Ease the slave tube into the drive shaft until the slave tube splines abut the internal splines in the drive shaft, then turn the tube slightly each way until the master splines align. Engage the splines, then ease the tube forward until the splines disengage with the drive shaft splines. Watching the tube flange, turn the tube 45 deg counter-clockwise (as viewed from the rear), to align the 'UNLOCKED' mark with the master splines on the drive shaft and rotor shaft rear.
- (5) Ease the tube forward and engage its master splines with the master spline of the spherical mounting, then push the tube forward and abut the tube end stop against the sleeve housing. Turn the tube 45 deg clockwise (realigning the master spline with the drive shaft master spline) and aligning the 'LOCKED' mark with the master splines. If the tube will not turn, the dogs on the mounting are out of alignment with the recesses in the drive shaft, and the rotor shaft rear must be eased (slightly) on/off the drive shaft until the tube/spherical mounting can be turned (45 deg clockwise).
- (6) Withdraw the tube drawing the splined end of the tube through the drive shaft splines. Remove the tube from the drive shaft.
- (7) Screw the lifting fixture (Tool 1323) on to the rear end of the signal tube. Align the alignment tool (Tool 611) master spline with the serrated sleeve (2-150) master spline, then slide the tool onto the sleeve. Turn the locking sleeve (2-160) to align the master spline with the tool, then withdraw the tool from the signal tube.

NOTE: Ensure that the locking sleeve is not moved out of alignment with the serrated sleeve, otherwise difficulty will be found engaging the signal tube in the drive shaft.

SUB-ASSEMBLY

**72-31-04**

Page 535

Oct 1/76

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (8) With the split sleeves assembled, locate the signal tube in the sleeves. Taking note of the master spline in the rotor shaft rear and aligning the signal tube master spline with it, slide the tube into the drive shaft taking care not to damage the carbon bearings inside the drive shaft. When the serrated sleeve of the signal tube abuts the internal splines in the drive shaft, turn the tube until the master splines align, then ease the tube into engagement. Remove the split sleeves, then ease the tube forward, sliding the serrated sleeve through the splines of the drive shaft and spherical mounting and into the sleeve housing, until the signal tube flange abuts the internal sleeve in the (rear end) of the drive shaft. If difficulty is found engaging the signal tube serrated sleeve in the spherical mounting, note the position of the tube, then turn the tube to engage the sleeve in the mounting. When engaged, turn the tube back to its original position to align the serrated sleeve/ spherical mounting with the locking sleeve, (which cannot be turned as it is engaged in the drive shaft splines), then push the tube in, engaging the serrated sleeve in the sleeve housing, and the locking sleeve in the spherical mounting.

B. Carry Out Dimensional Checks on the Rotor Shaft Rear, LP Drive Shaft and Signal Shaft Tube.

- (1) Ensure that the signal tube is in its fully forward position, then unscrew and remove the lifting fixture from the signal tube. Using a depth gauge, measure the dimension from the rear face of the drive shaft to the rear face of the flange on the signal tube (Ref.Fig.512). The dimension will be between 1.705 in. (43,31 mm) and 1.717 in. (43,61 mm). Record as dimension 'A'.

NOTE: An incorrect dimension 'A' may mean that the sleeve (2-170) was not correctly assembled (Ref. para.2.C.(4)).

OVERHAUL

- (2) Using a depth gauge, measure the dimension from the forward face of the outer guide (72-31-05/1-90), to the front face of the flange (the abutment face that contacts the drive shaft when the outer guide is assembled to the drive shaft) (Ref.Fig.512). This dimension will be between 1.692 in. (42,98 mm) and 1.695 in. (43,05 mm). Record as dimension 'B'.
- (3) The clearance between the signal tube and the outer guide on final assembly will be = Dimension 'A' - Dimension 'B'. The clearance must be between 0.010 and 0.025 in. (0,254 and 0,635 mm).
- (4) Locate a suitable dial gauge fixture on the drive shaft near the rotor shaft rear, and position to engage the dial gauge pointer on the rear face of the rotor shaft rear. Check the end-float between the rotor shaft rear/spherical mounting and the drive shaft, by pushing/pulling the rotor shaft rear on the drive shaft and reading off the gauge. The end-float must be between 0.007 and 0.035 in. (0,18 and 0,89 mm).

NOTE: The trial assembly and dimensional check of rotor shaft rear and spherical mounting is now completed, though the rotor shaft and mounting are used for setting up the signal system.

#### 6. Assemble and Check the Signal System Items

- A. Assemble the Signal System Items to the Drive Shaft and Signal Tube (Ref.Fig.513).

NOTE: The signal system items are from breakdown 72-31-05.

- (1) Examine the rear end of the signal tube or the splines for two etched or pop marks. If no marks are evident, etch the end of the two splines, to align with the master splines on the outside diameter of the LP drive shaft rear end.

OVERHAUL

- (2) Examine the faces at the splined ends of the inner guide (1-60) and helical splined nut (1-50) for etched or pop marks, then offer the splined nut over the inner guide and (by trial and error) mesh the splines so that when the end faces are flush, the etched or pop marks align (Ref.Fig.513). If one or both items are new and are not etched or pop marked, they may be assembled to each other so that the splines are engaged in any position. With the end faces flush, etch (in line) both end faces, or if one item is already marked, etch the other unmarked item in alignment with the existing etched or pop mark.
- (3) With the inner guide and splined nut assembled with the etched or pop marks on the end faces aligned, offer the splined ends of the items on to the setting gauge (Tool 17) (Ref.Fig.513). Examine the sides of the inner guide and splined nut for an etched cross in line with the pop or etched marked front face. Ensure that the etched marks are correct, or if incorrect or unmarked, etch a vertical line on both items (in line with the pop marked front face), and a horizontal line across the vertical line, on the inner guide as close to the splined nut as possible. Delete any incorrect marks.
- (4) With the inner guide and splined nut correctly positioned, relative to one another, secure them in this position with the setting gauge (Tool 18).
  - (a) Ensure the setting gauge setting blocks are drawn outwards, the two clamp plates are turned sideways and the three thumbscrews are undone.
  - (b) Offer the setting gauge over the inner guide, and guide the end of the inner guide through the hole in the setting gauge. Ensure that the setting gauge flange abuts the splined nut flange, and that the splined nut and inner guide are in contact with their respective faces on the setting gauge.

IN35024

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (c) Tighten the three thumbscrews against the inner guide, then turn the two clamp plates and locate them under the splined nut flange and tighten the two locknuts.
- (5) To assist in aligning the inner guide with the signal tube, withdraw the signal tube approx. 0.75 in. (19,0 mm) out of the drive shaft to expose the splined portion, taking care it is not withdrawn completely from the sleeve housing in the rotor shaft rear. Offer the slave spacer ring (Tool 1296) (equivalent to the max. permissible thickness adjusting washer), over the end of the signal tube and push it onto the tube until it abuts the tube flange.
- (6) Remove the inner guide/splined nut/setting gauge from the setting gauge then offer the outer guide over the splined nut. Examine the end face of the outer guide for a pop or etched mark, then by trial and error, engage the outer guide on the splined nut so that the etched or pop mark on each item align with one another when the end faces are flush. If the outer guide has no etched or pop mark, it can be engaged with the splined nut in any position.
- (7) Offer the assembly of inner/outer guide/splined nut/setting gauge to the end of the signal tube, align the etched or pop mark on the inner guide between the two etched or pop marks on the signal tube, then ease the inner guide on to the signal tube engaging the splines. Push the assembly on to the signal tube and ease the outer guide (slightly) forward, as necessary, to engage the splines on the outer guide with those in the drive shaft. Push the assembly fully forward, ensuring that the signal tube is pushed fully forward and its flange is abutting the sleeve in the rear end of the drive shaft.

PRINTED IN ENGLAND

TN32970

SUB-ASSEMBLY

**72-31-04**

Page 541

Oct 1/76

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (8) Push the two setting blocks inwards abutting the splined nut, then tighten the block nuts. Ensure that the setting gauge is pushed fully towards the drive shaft then offer the checking gauge (Tool 19) to the gap between one of the setting blocks and the flange of the outer guide (dimension 'X'). The gauge is  $0.060 \pm 0.0002$  in. ( $1,524 \pm 0,005$  mm) and the dimension 'X' must be less than the gauge thickness. If the dimension 'X' is greater than the gauge, withdraw the assembly of the inner/outer guide from the drive shaft/signal tube, then withdraw the outer guide from the splined nut, reposition the guide relative to the nut, then slide the guide back on to the nut. Withdraw the signal tube approx. 0.75 in. (19,0 mm) out of the drive shaft to expose the splined portion, align the etched or pop mark on the inner guide with the etched or pop marks on the signal tube, then engage the inner guide with the signal tube and the outer guide with the drive shaft. Ensure that the signal tube is abutting the spacer and the location ring is pushed fully towards the drive shaft, then offer the gauge (Tool 19) to the gap between one of the setting blocks and the flange of the outer guide (dimension 'X'). Repeat the repositioning of the outer guide on the splined nut until dimension 'X' is less than 0.060 in. (1,524 mm).

B. Carry Out Dimensional Check to Determine the Adjusting Washer Thickness.

- (1) With dimension 'X' within limits, the signal tube abutting the spacer and the setting gauge pushed in, with the inner guide abutting the slave spacer ring hold the setting gauge from rotation and take up the spline tolerances by lightly pulling back on the outer guide. Using feeler gauges check the dimension 'T' between the rear face of the drive shaft and the front face of the outer guide flange. Record the dimension 'T'.

NOTE: The dimension 'T' is the amount to be deducted from the slave spacer ring thickness, to give the correct adjusting washer thickness to enable the flange of the outer guide to abut the drive shaft rear face, whilst the inner guide abuts the adjusting washer.

IN35025

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (2) Withdraw the inner/outer guide assembly from the drive shaft/signal tube, ensuring the outer guide is not disengaged, and place the front faces of the items on a clean flat surface.
- (3) With the front face of the outer guide flush with the front face of the splined nut, ensure that the etched or pop mark on the outer guide (if present) is in line with the etched or pop mark on the splined nut. If the etched or pop mark on the outer guide is incorrectly positioned, cancel the old etched or pop mark and re-etch in line with the etched or pop mark on the splined nut. If no etched or pop mark is present on the front face of the outer guide, etch a mark in line with the etched or pop mark on the splined nut.

NOTE: When the front faces of the inner and outer guide and the helical nut are flush, the three pop marks must be in line (Ref.Fig.513).

- (4) Remove the slave spacer ring from the signal tube. Measure the thickness of the slave ring, then from this dimension subtract dimension 'T' (Ref. para.(1)). The resultant dimension is the thickness the adjusting washer must be. Measure the thickness of the original adjusting washer and if correct it can be used, or if incorrect obtain a washer of the required thickness. Apply marking blue to one of the faces of the correct thickness adjusting washer, then offer the washer over the end of the signal tube with the blue face facing outwards (rearwards). Push the washer on to the tube until it abuts the step on the tube.
- (5) Withdraw the signal tube approx. 0.75 in. (19,0 mm) out of the drive shaft to expose the splined portion, taking care it is not withdrawn completely from the sleeve housing in the rotor shaft rear. Apply marking blue to the rear face of the drive shaft.

SUB-ASSEMBLY

72-31-04

Page 543

Oct 1/76

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (6) Offer the assembly of inner/outer guide/splined nut/setting gauge to the end of the signal tube, align the mark on the inner guide between the two marks on the signal tube, then ease the inner guide on to the signal tube engaging the splines. Ensure the inner guide does not contact the adjusting washer, push the signal tube and the assembly forward and ease the outer guide (slightly) forward, as necessary, to engage the splines on the outer guide with those in the drive shaft. Push the signal tube forward and ensure it is abutting the spacer, then push the assembly fully forward.
- (7) With the assembly pushed fully forward, ensure the gap between the setting blocks and the flange of the outer guide (dimension 'X') is within limits, by offering the gauge (Tool 19) to the gaps. If the gap is outside the limits (0.060 in. (1,524 mm)), remove the assembly from the signal tube/drive shaft and clean off any marking blue from the inner and outer guides and if required, apply fresh blue to the adjusting washer and drive shaft. Ensure that the outer guide has not been removed and repositioned, by checking that the front faces of the splined nut and outer guide are flush when the etched or pop marks are aligned. If they are out of alignment, remove and re-engage the outer sleeve on the splined nut until the marks are aligned, then offer the assembly to the signal tube/drive shaft and recheck dimension 'X'. If the marks were aligned, offer the assembly to the signal tube/drive shaft, but ensure the outer guide is not moved too far forward engaging it in the wrong spline in the drive shaft. Recheck the dimension 'X'.
- (8) After achieving a satisfactory 'X' dimension, withdraw the assembly of the inner/outer guide from the drive shaft/signal tube and examine the inner and outer guides for blueing. Witness of blueing should have occurred on both faces which indicates the adjusting washer thickness is correct, ensuring the outer guide

IN35027

SUB-ASSEMBLY

72-31-04

Page 544

Oct 1/76

OLYMPUS 593

MK.610-14-28

OVERHAUL

abuts the drive shaft, and the inner guide abuts the adjusting washer. If blueing has not occurred on the outer guide, offer the assembly to the signal tube/drive shaft, and with the assembly pushed fully forward, hold the setting gauge from rotation and take up the spline tolerances by lightly pulling back on the outer guide. Use feeler gauges and check the thickness of the gap between the outer guide and the rear face of the drive shaft. This dimension is the amount that must be removed from the adjusting washer to give the correct assembly. If blueing has not occurred on the inner guide, the adjusting washer is too thin, and it is recommended that the adjusting washer is removed and the slave spacer ring (Tool 1296) fitted and the required thickness of the washer recalculated as detailed in para.(1) - (4). On completion of the blue check remove all traces of marking blue from the inner and outer guides.

- (9) Place the front faces of the assembly on a clean flat surface, release and withdraw the two clamps of the location ring from the splined nut, then unscrew the three thumbscrews and withdraw the setting gauge from the inner guide and splined nut. Stow the setting gauges (Tool 17 and 18) and checking gauge (Tool 19) in their container (Tool 202).
- (10) Check that sufficient marking blue remains on the drive shaft rear face and the adjusting washer rear face. With the adjusting washer assembled to the signal tube, correctly engage the assembly of the inner/outer guide/splined nut with the signal tube/drive shaft. Check that the horizontal and vertical (etched) lines on the splined nut and inner guide are in the correct relationship with one another (Ref. para.6, (3)). Withdraw the inner/outer guide/splined nut and check that blueing has occurred on the inner and outer guides. If the position of the lines are incorrect and/or blueing has not occurred on both items, recheck by starting the procedure again (Ref. para.6.A.).

NOTE: This check ensures that the items did not move in the location ring during setting up, giving false dimensions.

SUB-ASSEMBLY

OVERHAUL

- (11) Remove the adjusting washer from the signal tube, remove all traces of marking blue from the four items, then place the washer together with the inner/outer gauge and splined nut in the container with the remainder of the signal system items.

NOTE: The signal system items are now ready to be assembled to the signal tube at final build (Ref.72-00-00 Assembly).

C. Remove the Rotor Shaft Rear/Spherical Mounting from the Drive Shaft.

- (1) Screw the lifting fixture (Tool 1323) onto the rear end of the signal tube. Ease the signal tube rearwards until it comes out of contact with the sleeve housing and engages with the spherical mounting. Turn the signal tube 45 deg anti-clockwise (as viewed from the rear), then withdraw the signal tube from the spherical mounting until the tube abuts the drive shaft. Turn the tube 45 deg clockwise, then ease it rearwards and engage it in the master spline in the drive shaft.
- (2) Assemble the split sleeves (Tool 609) into the rear end of the drive shaft, then withdraw the signal tube out of the drive shaft taking care not to damage the carbon bearings inside the drive shaft. Remove the lifting fixture from the signal tube, then stow the tube in its fixture (Tool 1452). Remove the split sleeves from the drive shaft.
- (3) Withdraw the rotor shaft rear from the LP compressor drive shaft and place it in a suitable container. Return the rotor shaft rear to the LP compressor assembly final build station (Ref.72-31-00 Assembly).
- (4) Slide the protector (Tool 408) onto the rear end of the drive shaft, then assemble the split protector (Tool 999) to the front end of the drive shaft (to protect the splines and labyrinth), and secure the protector with its thumbnut.

NOTE: The LP compressor drive shaft is now complete, and can be built into the HP compressor assembly during its assembly (Ref.72-33-00 Assembly).

7. Assembly Carbon Bearings to the Stiffener Disk (Ref.Fig.514)

A. Prepare to Assemble Bearings.

- (1) Check for condition and bore size 2.600 in./2.6012 in.  
(66,04 mm/66,07 mm).
- (2) Obtain two off part machined carbon bearings  
(1-200A).
- (3) Identify and check for condition of the two plates  
(1-204A, 1-206A).

B. Assemble Carbon Bearings.

- (1) Heat stiffening disk to  $400 \pm 10$  deg C. for one hour  
then assemble plates and bearings.

C. Finish Machine Carbon Bearings.

- (1) When cooled locate stiffener disk assembly in vee  
blocks on a surface table.
- (2) Set datum 'A' as true as possible at each end, and  
check rim diameters marked 'AE' Fig.514 are concentric  
to within 0.008 in. (0,20 mm) true indicated reading.
- (3) Finish bore through carbon bearing to 1.9715 in./  
1.9725 in. (50,076 mm/50,102 mm).
- (4) Turn stiffening disk assembly through 180 degrees  
and finish bore carbon bearing to 1.9715 in./1.9725 in.  
(50,076 mm/50,102 mm).
- (5) Remove all burrs and sharp edges.

## 72-32-00

Contents 6

Jun 1/99

OLYMPUS 593

MK.610-14-28  
OVERHAULCOMPRESSOR INTERMEDIATE CASE ASSEMBLY - SUB-ASSEMBLY1. General

- A. Prior to commencing assembly, refer to 72-09-00 Assembly for general information.
- B. Throughout the text special tools are quoted by their Ref.No. e.g. (Tool 1234). For a complete list of tooling required for the assembly and for the Manufacturer No., refer to Special Tools, Fixtures and Equipment Table 1002.
- C. During the sub-assembly procedure, reference will be made to the Illustrated Parts Catalogue to identify those items where the nomenclature does not positively identify them, due to the duplication of the title e.g. nuts, bolts, washers, bearings, gears, housings, tubes etc. When the item is a part of the breakdown of the text concerned, the item will be identified as bolt (1-10), the 1 referring to the I.P.C. Fig.No., and the 10 referring to the Item No. Where items from a different breakdown are introduced, then the breakdown number will be quoted in addition e.g. bolt (72-32-01/1-10).
- D. During the sub-assembly procedure, where the thickness of adjusting washers has to be determined, the words 'select' or 'select from the range' are used. If a range of washers is not available, it may be necessary to machine the washer to achieve the desired thickness. The information for machining washers is given under chapter 72-09-21 Repair. During the assembly procedure, the machining procedure reference will be given immediately after each adjusting washer I.P.C. Ref. No. in the appropriate part of the text e.g. select from the range the correct thickness adjusting washer (3-70) (72-09-21 Repair, Fig.401).

2. Prepare Assembly for Build

- A. Prepare Segments and Sub-assembly Inner Case.
  - (1) Place the sub-assembly inner case (5-330) on a clean worktop front face uppermost (the segment locations are nearest the front flange).
  - (2) Ensure the location pin (5-350) (TOP position) has been assembled to the front flange, then check the number of and security of the shank nuts (5-340) swaged to the front and rear flanges of the case.

OLYMPUS 593

MK.610-14-28

OVERHAUL

SNECMA

- (3) Check each segment location in the inner wall of the case for cleanliness, also check all the vent plug, locking plate and bolt abutment areas on the outer wall of the case for cleanliness.

CAUTION: MATERIAL TRAPPED BETWEEN ABUTMENT FACES  
COULD RESULT IN AN OIL LEAK.

- (4) Examine the six hexagon headed vent plugs, paying particular attention to the threads and the abutment face under the head, if necessary lightly stone the under head abutment face to dress any nicks or burrs.
- (5) Examine the segment securing bolts, nuts, washers and locking plates for cleanliness and nicks or burrs.
- (6) Examine each of the three segments for cleanliness, paying particular attention to the convex mating face of each segment.

B. Assemble Segments to Sub-assembly Inner Case (Ref.Fig.501A).

- (1) Position the sub-assembly inner case (5-330) on the worktop front face uppermost, with the locating pin (TOP) in the front flange of the case furthest from the operator.
- (2) Commencing at the (TOP) locating pin position, proceed in a counter-clockwise direction and mark the position of segments A, B and C on the case using a suitable marker or tape. Do not mark or use tape on the actual abutment faces.
- (3) Mark on the work surface the relative positions A, B and C.
- (4) If the segment positions relative to the case were identified and temporarily marked or recorded during disassembly procedure, then place the items in their respective positions, A, B and C on the worktop.
- (5) If the temporary identification markings have been removed refer to Fig.501A for the positions, then place the items in their respective positions on the worktop, A, B and C.

NOTE: Laying the items out in this manner will permit them to be assembled quickly in sequence after the Loctite has been applied.

SUB-ASSEMBLY

72-32-00

Page 502

OLYMPUS 593

MK.610-14-28  
OVERHAUL

sneema

- (6) Ensure all the segment securing bolts, nuts and vent plugs have been degreased and that the components have stabilized to room temperature. Carefully apply lubricant 'A' to the threads only of three bolts (5-326), and to the threads of one bolt (5-327).
- (7) Take a segment, identified as A from the worktop, then position it in the case (5-330), with the static seal location faces uppermost, to the first segment location counter-clockwise from the location pin (TOP) in the front flange.

NOTE: All the segment securing boltheads are to face inboard and the nuts assembled, initially finger-tight.

- (8) Insert a bolt (5-326) through the first hole counter-clockwise from TOP, then assemble a flat washer washer (5-324) and nut (5-323). Assemble the hexagon headed bolt (5-327) to the next hole and bolts (5-326) to the following two holes, then assemble a locking plate (5-325) over the two central bolts and retain the bolts and locking plate with nuts (5-323).
- (9) Hold the boltheads, then run the nuts down ensuring they have a locking (rundown) torque between 3 and 10 lbf in. (0,3 and 1,1 N.m). Do not tighten the bolts.
- (10) Apply locking compound 'B' to the threads and underhead radius of the two vent plugs (5-322), then screw the plugs into the assembled segment, do not tighten the plugs.

CAUTION: TORQUE-TIGHTENING SEQUENCE OF BOLTS AND VENT PLUGS MUST BE OBSERVED.

- (11) Refer to Fig.501A, then torque-tighten the bolts in sequence. Starting with the bolts in the centre of the segment, torque-tighten the two bolts numbered 1 to 135 lbf in. (15,2 N.m).

SNECMA

- (12) Torque-tighten the two vent plugs (5-322) numbered 2 between 550 and 600 lbf in. (62,1 and 67,8 N.m).
- (13) Torque-tighten the two outer bolts numbered 3 to 135 lbf in. (15,2 N.m).
- (14) Using 0.031 in. (0,8 mm) thickness locking wire, wire-lock each vent plug to the locking plate.
- (15) Carefully apply lubricant 'A' to the threads of four bolts (5-326).
- (16) Take a segment identified as B from the worktop, (note the smaller plugs and smaller vent holes in the segment), then position it in the case (5-330) to the bottom-most segment location.
- (17) Insert the four bolts (5-326) through the segment and case, then assemble a locking plate (5-325) to the two centre bolts and retain the bolts and locking plate with nuts (5-323).
- (18) Hold the bolts, then run the nuts down ensuring they have a locking (rundown) torque between 3 and 10 lbf in. (0,3 and 1,1 N.m). Do not tighten the bolts.
- (19) Apply locking compound 'B' to the threads and under-head radius of the two vent plugs (5-321), then screw the plugs into the segment assembled to the bottom of the case, do not tighten the plugs.
- (20) Refer to Fig.501A, then torque-tighten the bolts in sequence. Starting with the bolts in the centre of the segment, torque-tighten the two bolts numbered 1 to 135 lbf in. (15,2 N.m).
- (21) Torque-tighten the two vent plugs (5-321) numbered 2 between 310 and 340 lbf in. (35,0 and 38,4 N.m).
- (22) Torque-tighten the two outer bolts numbered 3 to 135 lbf in. (15,2 N.m).

- (23) Using 0.031 in. (0,8 mm) thickness locking wire, wire-lock each vent plug to the locking plate.
  - (24) Apply lubricant 'A' to the threads of four bolts (5-326).
  - (25) Assemble the last segment to position C in the case and retain it in position with the four bolts (5-326), then assemble a locking plate (5-325) to the two centre bolts, nuts (5-323) and one flat washer (5-324). The flat washer is to be assembled under the nut at the last bolt position counter-clockwise from the location pin (TOP).
  - (26) Hold the boltheads, then run the nuts down ensuring they have a locking (rundown) torque between 3 and 10 lbf in. (0,3 and 1,1 N.m). Do not tighten the bolts.
  - (27) Apply locking compound 'B' to the threads and under-head radius of two vent plugs (5-322) then screw the plugs into the assembled segment, do not tighten the plugs.
  - (28) Refer to Fig.501A, then torque-tighten the bolts in sequence. Starting with the bolts in the centre of the segment, torque-tighten the two bolts numbered 1 to 135 lbf in. (15,2 N.m).
  - (29) Torque-tighten the two vent plugs (5-322) numbered 2 between 550 and 600 lbf in. (62,1 and 67,8 N.m).
  - (30) Torque-tighten the two outer bolts numbered 3 to 135 lbf in. (15,2 N.m).
  - (31) Using 0.031 in. (0,8 mm) thickness locking wire, wire-lock each vent plug to the locking plate.
- C. Assemble Test Equipment to Sub-assembly Inner Case (Ref.Fig.501B).
- (1) Ensure the front and rear flanges of the inner case (5-330) are clean and free from nicks or burrs, lightly stone the flanges if necessary.

SUB-ASSEMBLY

sneema

- (2) Inspect the abutment faces of the sump, inner end drive housings and distributor for cleanliness, dress any nicks or burrs if necessary. Examine the six static seal locations of the segments for cleanliness, dress any nicks or burrs if necessary.
- (3) Position the case (5-330) on the worktop front face uppermost, then inspect the two blanks (Tool 1916) for cleanliness, ensuring that the gaskets are serviceable, assemble the blanks to the segment at the bottom-most position of the case (opposite the location pin (TOP) in the front flange). Secure the blanks with the captive bolts.
- (4) Examine the four blanks (Tool 1915) and their gaskets for cleanliness and serviceability, then assemble them to the remaining vent locations on the segments. Secure the blanks with the captive bolts.
- (5) Examine the following blanks and test equipment for cleanliness and serviceability of gaskets:  
  
Blank (Tool 3060) No.2 vane  
Blanks (Tool 3061) No 3 and 5 vanes  
Blank (Tool 3062) No 4 vane  
Clamp ends (Part of test equipment Tool 3063)
- (6) Assemble a blank (Tool 3060) to vane No.2 location and retain with six slave bolts, torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (7) Assemble a blank (Tool 3061) to No.3 vane location, noting the dowel location hole in the blank, secure the blank with six slave bolts, torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (8) Assemble a blank (Tool 3061) to No.5 vane location, noting the dowel location hole in the blank. Secure the blank with six slave bolts, torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m).

SUB-ASSEMBLY

Page 502E

Jun 1/99

OLYMPUS 593

MK.610-14-28

sneema

OVERHAUL

- (9) Ensure the fibre washer is in position between the adapter and the blank (Tool 3062), observe the two location pin holes then assemble the blank to No.4 vane location and secure with slave bolts. Torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (10) Turn the case onto its side, then assemble the respective clamp ends (part of Tool 3063) onto the front and rear flanges of the case observing the location pin hole in the front clamp. Secure both clamp ends by tightening the nut on the front clamp end, do not over tighten.

D. Carry out Pressure Test (Ref.Fig.501B).

- (1) Position the sub-assembly inner case in a convenient location near the mobile oil rig (Tool 583 or 1926) with the blank at No.4 vane uppermost.

**WARNING:** A HIGH OIL TEMPERATURE WILL BE MAINTAINED DURING PRESSURE TEST. SAFETY PRECAUTIONS. MUST BE STRICTLY OBSERVED AT ALL TIMES.

- (2) Ensure all switches and valves on the test rig are in the OFF position before proceeding with the test.
- (3) Connect the delivery hose from the rig to the inlet connector on the inner case (No.4 vane).
- (4) Ensure that the pressure gauge (part of Tool 3063) has been assembled in the scavenge line up-stream of the scavenge throttle, then connect the scavenge hose from the rig to the inner case.
- (5) Place the safety screens (Tool 829) around the test rig and inner case.
- (6) Ensure that the workshop electrical supply for the rig is switched off, then connect the rig to the supply.

SUB-ASSEMBLY

**72-32-00**

Page 502F

Jun 1/99

OLYMPUS 593

MK.610-14-28  
OVERHAUL

sneema

- (7) Check the oil level in the rig then top-up with lubricant 'A' if necessary.
- (8) Fully open the throttling valve in the scavenge line.
- (9) Slacken the adapter at No.4 vane sufficiently to allow air to expel.
- (10) Switch on the electrical supply to the rig, then start the circulating pump motor. Open the delivery valve on the test rig sufficiently to allow the inner case to gradually fill with oil and expel air through the No.4 vane connector, then tighten the connector.
- (11) Check the blanks, end clamps and connectors for oil leaks. If there are any superficial leaks at this stage, switch off the circulating pump motor, drain the inner case of oil and rectify the leaks as necessary then repeat the appropriate parts of para. (9) and (10).
- (12) If there are no leaks, switch off the circulating pump motor, then close the delivery line at the rig.
- (13) Set the temperature control to 140°C then switch on the oil heater.

**WARNING:** ENSURE ADEQUATE VENTILATION IN THE TESTING AREA DURING HIGH OPERATING TEMPERATURES.

- (14) With the throttling valve fully open and the oil temperature raised to 140°C switch on the circulating pump motor, then open the delivery valve on the rig and flow full bore for 15 minutes to allow the case temperature to stabilize.
- (15) Adjust the scavenge throttle to produce 10 psig (69 kPa) on the pressure gauge installed in the scavenge line, then adjust the temperature control to obtain 120°C and flow for a further 30 minutes.

E. Check for Leaks.

- (1) Observe for leaks at each of the 12 segment retaining bolt positions, the six hexagon vent plugs and also check for seepage from under the locking plates.
- (2) Leaks from the mounting segment bolts, vent plugs and locking plates are acceptable provided that during the 30 minute leakage check period, the total leakage does not exceed 25 ml during the final 15 minutes, slight seepage is acceptable.

NOTE: "Seepage" is defined as a witness of dampness which does not form a droplet or globule during a minimum of 30 minutes under the specified test condition. Anything which does form a droplet or globule within this period is termed a "leak".

- (3) Switch off the circulating pump motor and heater, then close the delivery valve. Switch off the electrical supply to the rig.
- (4) Allow the sub-assembly inner to cool, then disconnect the delivery and scavenge hoses from the case and drain off the oil from the chamber.
- (5) Disassemble the clamp ends from the case and place them in a container.
- (6) If the pressure test proved unsatisfactory, leave the remaining blanks assembled to the case, then disassemble the segment items as required to rectify the leak (Ref.72-32-00, Disassembly).
- (7) Reassemble the items and repeat the pressure test as detailed in the appropriate para. of this chapter.
- (8) When the pressure test is satisfactory, remove the remaining blanks and place them in a container.

## F. Assemble the Housings to the Sub-assembly Outer Case.

- (1) Assemble the housing (5-410) at the No.2 vane position from the inside of the case (5-420), ensuring that the shaped profile of the housing matches that of the case.
- (2) Apply lubricant 'A' to six bolts (5-400), and assemble through the case and the housing with the bolt heads outside. Secure the housing with six nuts (5-390) on the inside.
- (3) Check that the locking (run-down) torque is at least 3.5 lbf in. (0,4 N.m), then torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (4) Assemble the housing (5-380) at the No.4 vane position from the inside of the case (5-420), ensuring that the shaped profile of the housing matches that of the case.
- (5) Apply lubricant 'A' to the six slave bolts, and assemble through the case and the housing with the bolt heads outside. Secure the housing with six slave nuts on the inside.
- (6) Check that the locking (run-down) torque is at least 3.5 lbf in. (0,4 N.m), then torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).

## G. Assemble the Sub-assembly Inner Case to the Sub-assembly Outer Case. (Ref. Fig.501C and 501D).

NOTE: The sub-assembly outer case (5-420) will require heating for reassembly to the inner assembly, preparatory work on items should be carried out at a convenient point near the oven.

- (1) Place the sub-assembly inner case (5-330) and the sub-assembly outer case (5-420) on a clean worktop front face uppermost.

NOTE: Three equi-spaced holes (120 deg apart) in both the cases are used to align the cases correctly during reassembly. Six slave bolts will be required to retain the two cases while the cases normalize to room temperature.

SUB-ASSEMBLY

MK.610-14-28  
OVERHAUL

sneema

- (2) Note the locating pin (5-350) (TOP) in the front flange of the sub-assembly inner case (5-330), then insert an alignment pin (Tool 3064) in No.5 hole counter-clockwise from the locating pin (TOP) (viewed rearward), then insert an alignment pin (Tool 3064) in No.15 hole from the present position and then No.25 hole. If difficulty is experienced inserting the alignment pins (Tool 3064), examine the pins and material around the holes for possible nicks or burrs, lightly dress damage marks if necessary.

NOTE: The alignment pin check on both cases is to ensure that the pins can be inserted into the holes quickly without problems arising after the sub-assembly outer case (5-420) has been heated to 120°C.

- (3) Note the locating pin hole (TOP) in the front flange of the sub-assembly outer case (5-420), then using the information in para.(2) identify each of the three corresponding equi-spaced location holes and suitably mark their positions on the outside of the case for reassembly convenience, then insert an alignment pin (Tool 3064) in each of the three holes. Lightly dress any nicks or burrs, if required, to ensure ease of assembly of the pins.
- (4) Clearly identify the TOP position on the front flange of the sub-assembly outer case (5-420).
- (5) Set the oven to 120°C and allow it to reach this temperature, then place the case (5-420) in the oven (front flange uppermost) for one hour.
- (6) Place the three alignment pins (Tool 3064) and the six slave bolts at a convenient point on the worktop in readiness for the assembly procedure.
- (7) Unscrew and remove the hand knob and clamping ring from the assembly fixture (Tool 3065), then observing the location pin (TOP) in the front flange of the sub-assembly inner case (5-330) and the TOP position of the assembly fixture, lower the case over the hexagon pillar ensuring that the location dowel in the base plate enters the hole in the rear flange of the inner case at the BOTTOM position. The correct hole strikes a line exactly 180 deg relative to the pin in the front flange.

- (8) Reassemble the clamping ring to the hexagon pillar then secure the ring to the inner case with the hand knob.

**WARNING:** OBSERVE SAFETY PRECAUTIONS WHEN REMOVING HOT CASE FROM OVEN.

**NOTE:** Assistance will be required during assembly of the two cases.

- (9) Wearing protective gloves, remove the outer case from the oven and position it over the inner case so that the location pin hole (TOP) in the outer case aligns the location pin (TOP) protruding from the inner case front flange.
- (10) Lower the outer case onto the inner case ensuring that the location pin (TOP) of the inner case enters the corresponding hole (TOP) of the outer case and that the location dowel in the fixture enters the hole in the outer rear flange of the sub-assembly outer case (5-420).
- (11) Insert the three alignment pins (Tool 3064) into the previously identified three equi-distant location holes, if necessary lightly tap the pins home to ensure correct alignment of the two cases before the temperature falls.
- (12) Assemble the six slave bolts (equally spaced) and washers to the front flanges of the two cases, then torque-tighten the six bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (13) Allow the cases to normalize to room temperature, then withdraw the three alignment pins and place them in a protective container.
- (14) Unscrew and remove the hand knob and clamping ring from the fixture and case (5-330) then remove the case assemblies and place the unit in a protective container. Reassemble the clamping ring and hand knob to the fixture.

#### H. Prepare for Assembly of Inner Case to Outer Case.

- (1) Prior to commencing assembly, check module compatibility of labyrinths SB.72-91 and SB.72-93.

SUB-ASSEMBLY

**72-32-00**

Page 502P

Jun 1/99

OLYMPUS 593

MK.610-14-28

OVERHAUL

sneema

- (2) Ensure that six equally spaced slave bolts and washers (Ref.Fig.509) have been assembled to the front inner flange to secure the inner and outer sub-assemblies (5-330 and 5-420).

NOTE: Refer to 72-09-00 Assembly for cleaning and priming bearings. In addition refer to S.B.72-17 for information on the LP and HP thrust bearing assemblies and S.B.72-135 for the sub-assembly outer case (5-420).

J. Check Component Serialization.

- (1) Check to ensure that all components identify with the I.P.C. then mark new major items with the engine identification symbol.

NOTE: The HP zerol bevel gear (72-61-00/1-41) together with the right (72-61-00/1-42) and left-hand (72-61-00/1-43) gearbox driven bevel gears assembled within the intermediate case are supplied initially in a matched set of three. Should any one of the three gears be rejected for any reason, then the complete set of three must be withdrawn and a replacement "matched set" introduced.

K. Check Plugs and Blanks.

- (1) If already assembled ensure all plugs and blanks are secure and locked satisfactorily. Check self-locking wire inserts.
- (2) Apply lubricant 'A' to the threads of two machine bolts (6-70) then assemble one bolt to the outer case, near the front flange between No.1 and 2 vanes and the other bolt to the outer case between No.1 and 6 vanes. Torque-tighten the two bolts between to 370 lbf in. (42,0 N.m).
- (3) Assemble a plug (6-60) and the bracket (6-55) between No.4 and 5 vanes. Position the bracket to the top and bottom left plug-retaining bolt positions, with the leg of the bracket extended over the case and inclined towards the rear flange (viewing the case front flange uppermost). Secure the bracket and plug with three bolts (6-50), with lubricant 'B' applied. Torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m). Locking (Run-down) torque 3.5 lbf in. (0,4 N.m).

OVERHAUL

- (4) Assemble the remaining five plugs (6-60) to the outer case and retain them with bolts (6-50) lubricated with lubricant 'A'. Torque-tighten the bolts (6-50) to 135 lbf in. (15,2 N.m). Locking (Run-down) torque 3.5 lbf in. (0,4 N.m). Wire-lock all of the bolts (6-70 and 6-50).

L. Check the Security of the Self-locking Shank Nuts (Ref.Fig.501E).

- (1) Ensure that the self-locking shank nuts are correctly assembled to the following items.
  - (a) Inner case sub-assembly (5-330) front flange nuts (5-340).
  - (b) Inner case sub-assembly (5-330) rear flange nuts (5-340).
  - (c) Inner case (5-420) rear flange nuts (5-430).
  - (d) Outer case (6-100) front inner flange nuts (6-110).
  - (e) Outer case (6-100) rear inner flange nuts (6-160).
  - (f) Air baffle (2-240) nuts (2-250).

M. Assemble Pins and Pegs (Ref.Fig.502).

- (1) Degrease the pins, then, using an approved freezing agent and wearing protective gloves, shrink fit the pins and locating pegs to the following locations.

NOTE: If the pin locations are defective, refer to 72-32-00 Repair No.10 and/or No.11.

- (a) Using driver (Tool 1800), assemble a shouldered pin (5-190) to the inner case sub-assembly (5-330) at No.3 vane position.
- (b) Using driver (Tool 1801), assemble two shouldered pins (4-340) to the inner case sub-assembly (5-330) at No.4 vane position.
- (c) Using driver (Tool 1800), assemble a shouldered pin (5-190) to the inner case sub-assembly (5-330) at No.5 vane position.

- (s) Using driver (Tool 1801), assemble two pins (4-350) inside the sump assembly (4-360).
- (t) Using driver (Tool 1802), assemble the two hollow-headed pins (4-430) to the outer case (6-100) at the outer location of No.4 vane.
- (u) Using driver (Tool 1802), assemble the two hollow-headed pins (4-250) to the outer case (6-100) at the outer location of No.4 vane.
- (v) Assemble two pins (4-190) to the sump case (72-64-00/1-90).
- (w) Shrink hollow pin (7-300) then, assemble it to the adapter plate (7-270).

N. Prepare for Assembly (SB.0L.593-72-9019-404 Standard) (Ref.Fig.503).

- (1) Place the inner case unit (5-330 and 5-420) on the worktop with the front face uppermost. Measure from the front face of the case to the bottom of the seal location AA, then record the measurement.

P. Prepare the Sealing Grooves and Faces for the 'C' Seals for Assembly (SB.0L.593-72-9053-426) (Ref.Fig.503).

- (1) Visually inspect all the sealing grooves and sealing faces for the 'C' seals to ensure there are no damage marks. Ensure the surface finish of the sealing grooves and faces is 32 microinches (0,8 micrometres).
- (2) If necessary, use seal location lapping kit (Tool 3156) to hand lap the sealing groove(s) to remove any damage marks and produce a surface finish of 32 microinches (0,8 micrometres). Use fine grade lapping paste (OMat 540 and 541).

NOTE: The Intermediate Case Inner has five sealing groove locations. The HP Drive Housings, left hand and right hand, have one sealing groove at the front of each rear flange.

OLYMPUS 593

MK.610-14-28

sneema

OVERHAUL

- (3) If necessary, locate the component in a suitable machine and set true. Skim grind the sealing face(s) to remove damage marks and produce a surface finish of 32 microinches (0,8 micrometres).

NOTE: The Intermediate Case Inner front flange drop dimension at position AA is 0.120/0.118 in (3,05/3,00 mm).

- (4) Visually inspect the lapped sealing groove(s) and/or sealing face(s) to ensure all damage marks have been removed and a surface finish of 32 microinches (0,8 micrometres) has been achieved. Dimensionally inspect sealing groove 0.120/0.118 in (3,05/3,00 mm) depth(s). Dimensionally inspect all other affected component(s).

NOTE: Where dimensions are outside those shown, contact the Rolls-Royce, Olympus 593 Project Office, Filton, Bristol; for corrective action.

Q. Assemble Inner Labyrinth to LP Bearing Housing  
(Ref.Fig.504).

- (1) Heat inner labyrinth (1-330) to 100° then using protective gloves, assemble labyrinth to front of LP bearing housing (1-270). Assemble the 24 bolts (1-260), locating the heads on rear face of inner front flange, lubricate threads with lubricant 'A' and secure with self-lock nuts (1-250).
- (2) Using wrench (Tool 1575), torque-tighten the bolts to 135 lbf in. (15,2 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m). After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 2.5 thread pitches beyond nut chamfer, the bolt must be renewed (Ref. SB.72-8334-205).

R. Assemble the LP and HP Compressor Thrust Bearings  
(SB.72-17 and 79).

NOTE: The following procedures on assembling thrust bearings are only applicable if original items are used. If new bearings are used, remove protective wrapping and grease (Ref.72-09-00 Assembly).

- (1) The following assembly procedure on each bearing should be carried out in an approved 'clean' room.
- (2) Mount the assembly tool (Tool 1986) either in a bench vice, or bolt it to an adapter plate (Tool 1987), which in turn must be bolted to a Hydraclamp. Ensure that the tool is mounted so that the tool handle when closed, points towards the operator.
- (3) Assemble the LP compressor thrust bearing (1-190).
  - (a) Hinge open the tool handle and release the clamp plates. Place the bearing outer track on the assembly tool so that the arrow on the outer track can be seen, then position and secure the tool clamps to hold the track.

- (b) Position the cage for the front set of balls within the outer track, so that the arrow is in correct relationship with the arrow on the track. From the set of front balls, select a ball, position it in the cage under the tool handle, then pull the handle forward and press the ball into the cage. Rotate the ball and cage approx. 120 deg and assemble another ball, then rotate the cage a further 120 deg and assemble a third ball to locate the cage. Assemble the remainder of the balls to the cage.
  - (c) Position the correct inner track to abut the inner side of the balls, then position the rear cage within the outer track, so that the arrow is in correct relationship with the arrow on the outer track.
  - (d) Position a ball in the rear cage under the tool handle, then pull the handle forward and press the ball into the cage. Rotate the ball and cage approx. 120 deg and assemble another ball, then rotate the cage a further 120 deg and assemble a third ball to locate the cage. Assemble the remainder of the balls to the cage.
  - (e) Ensure that each ball and cage rotates freely, then release and remove the bearing from the assembly tool. Position the two remaining inner tracks on the bearing, then align the arrow marks on the inner tracks and confirm the bearing has been assembled correctly. With the inner tracks held in position, rotate the outer track and check for free rotation. Apply temporary protection if required (Ref.72-09-00 Inspection/Check para.4).
- (4) Assemble the HP compressor thrust bearing (2-210).
- (a) Ensure that the tool handle is open and the clamp plates released. Place the bearing outer track on the assembly tool so that the arrow on the outer track can be seen, then position and secure the tool clamps to hold the track.
  - (b) Position the cage within the outer track, so that the arrow is in correct relationship with the arrow on the track. Position a ball in the cage under the tool handle, then pull the handle forward and press the ball into the cage. Rotate

SUB-ASSEMBLY

OVERHAUL

the ball and cage approx. 120 deg and assemble another ball, then rotate the cage a further 120 deg and assemble a third ball to locate the cage. Assemble the remainder of the balls to the cage.

- (c) Ensure that each ball and the cage rotate freely, then release and remove the bearing from the assembly tool. Assemble the two inner tracks to the balls ensuring that the arrow marks on the inner tracks are in correct relationship with the arrow on the outer track. With the inner tracks held in position, rotate the outer track and check for free rotation. Apply temporary protection to the bearing if required (Ref. 72-09-00 Inspection/Check para.4).
- (d) Release and remove the assembly tool from the bench vice or adapter plate, and, if used, the adapter plate from the Hydraclamp.

S. Determine Thickness of LP Thrust Washer (Ref.Fig.505).

**NOTE:** The machining operation is only required if the desired clearance of between 0.001 and 0.003 in. (0,025 and 0,076 mm) cannot be obtained (Ref.SB.72-28 and SB.72-17).

- (1) Measure from the bearing housing (1-270) retaining ring abutment face of the thrust washer location face and record as dimension A. Measure the thickness of the LP bearing (1-190) and record as dimension B. The required thrust washer (1-300) thickness =  $A - B - 0.001/0.003$  in. (0,025/0,076 mm). If the thrust washer requires machining locate the thrust washer face D to the machine face plate and set true to diameter X. Grind material from face C to achieve the calculated dimension, then blend machining into existing radius and remove sharp edges. Inspect surface finish (Ref.72-09-00 Inspection/Check).
- (2) Heat treat the washer for 1 hour at 150 deg C, cool in air then check for cracks (Ref.72-32-00 Inspection/Check). Measure the thickness of the thrust washer then log the dimension on the engine record sheets.

- (3) Using a suitable freezing agent and wearing protective gloves shrink the thrust washer (1-300), noting the offset pin, into the bearing housing (1-270), then assemble the bearing (1-190) and retaining ring (1-170). Secure the ring with bolts (1-160) then check that a clearance between 0.001 and 0.003 in. (0,025 and 0,076 mm) exists between the bearing and retaining ring. Release and remove the bearing retaining ring, then withdraw the bearing and place it in its protective container.

T. Determine Thickness of HP Oil Baffle (Ref.Fig.506).

NOTE: The machining operation is only required if the desired clearance of between 0.001 and 0.003 in. (0,025 and 0,076 mm) cannot be obtained (Ref. SB.72-17).

- (1) Temporarily assemble the bearing retaining ring (2-110) to the housing (2-80) and secure with slave bolts, washers and nuts. Measure from the bearing retaining ring abutment face to the oil baffle location face and record as dimension C. Measure the thickness of the HP bearing (2-210) and record as dimension D. The required oil baffle thickness =  $C - D - 0.001/0.003$  in. (0,025/0,076 mm).
- (2) If the oil baffle requires machining, locate the baffle face E to the machine face plate. Grind material from F to achieve the calculated dimension, then blend machining into existing radius and remove sharp edges. Inspect surface finish (Ref.72-09-00 Inspection check).
- (3) Ultrasonic clean the oil baffle (Ref.72-09-00 Cleaning).
- (4) Release and remove the retaining ring (2-110) then observing the offset pin assemble the oil baffle to the bearing housing. Assemble the bearing (2-210) and retain with the retaining ring (2-110), bolts, nuts and slave washers.
- (5) Check that a clearance between 0.001 and 0.003 in. (0,025 and 0,076 mm) exists between the bearing retainer and the bearing outer race. Release and remove the bearing retainer, then withdraw bearing from the housing and place in a protective container.

U. Determine Adjusting Washer Thickness of Right-hand Accessory Drive Inner End to Produce Axial Clearance (Ref.Fig.507).

- (1) Using Tool 254 and 1495 assemble the following items to the right-hand accessory drive housing (72-61-00/1-570).
  - (a) Roller bearing outer track (72-61-00/1-560).
  - (b) Ball bearing (72-61-00/1-380).
  - (c) Spacer (72-61-00/1-400).
- (2) Measure from the drive housing flange face to the washer abutment location and record as dimension E.
- (3) Measure from the roller bearing abutment flange to the washer abutment face and record as dimension F. The required adjusting washer thickness (72-61-00/1-410) (72-09-21 Repair, Fig.423) =  $E - F - 0.001 / 0.003$  in. (0,025/0,076 mm).

V. Determine Adjusting Washer Thickness for Right-hand Housing (Ref.Fig.508).

- (1) Measure from the washer location face on the inner case sub-assembly (5-330) to the housing abutment flange on the inner case outer sub-assembly (5-420) and record as dimension A.
- (2) Measure from the washer abutment face on the housing (5-100) to the inner case sub-assembly (5-330) abutment face on the housing (5-100) and record as dimension B.
- (3) Calculate adjusting washer thickness and select washer.
  - (a) Subtract dimension B from dimension A and record as dimension C.
  - (b) From the range available, select an adjusting washer (5-110) (72-09-21 Repair, Fig.408) within the tolerance of the following equation:

Adjusting washer thickness =

Dimension C plus 0.000 in. (0,00 mm)  
minus 0.002 in. (0,05 mm).

**NOTE:** The adjusting washers are increased through the range by increments of 0.0015 in. (0,038 mm) from a minimum size of 0.067 in. (1,701 mm) to a maximum size of 0.088 in. (2,235 mm).

- (4) Mark the housing and adjusting washer "right hand".
- (5) Install housing S.B.0L.593-72-9053-426 Standard. Ensure that the seal location is clean, then carefully manipulate the housing (5-100) with its correct adjusting washer (5-110) and seal (5-105) in position, through the bore of the case, at the same time aligning the locating pin on the inner flange. Press the housing into position (Ref.Fig.509).
- (6) Apply lubricant 'A' to six D-headed bolts (5-90), then assemble them to the inner case with the bolt-heads outboard. Ensure that the bolts are correctly assembled, then assemble nuts (5-80) to the bolts and torque-tighten the bolts to 135 lbf in. (15,2 N.m), ensure that the locking (run-down) torque is a minimum of 3.5 lbf in. (0,4 N.m). After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 2.5 thread pitches beyond nut chamfer, the bolt must be renewed (Ref.SB.72-8334-205).

W. Determine Adjusting Washer Thickness for Left-hand Housing (Ref.Fig.508).

- (1) Measure from the washer location face on the inner case sub-assembly (5-330) to the housing abutment flange on the inner case outer sub-assembly (5-420) and record as dimension A.

OVERHAUL

- (6) Apply lubricant 'A' to six D-headed bolts (5-90), then assemble them to the inner case with the bolt-heads outboard. Ensure that the bolts are correctly assembled, then assemble nuts (5-80) to the bolts and torque-tighten the bolts to 135 lbf in. (15,2 N.m), ensure that the locking (run-down) torque is a minimum of 3.5 lbf in. (0,4 N.m). After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 2.5 thread pitches beyond nut chamfer, the bolt must be renewed (Ref.SB.72-8334-205).
- (7) Remove the six slave bolts and washers from the front inner flange securing the two inner assemblies (5-330 and 5-420).

X. Assemble Outer Case to Build Stand (Ref.Fig.510).

- (1) Assemble the slave mounting ring (Tool 1264) over the studs to the build stand (Tool 1263) then secure with eight-off barrel nuts. Ensure the cutaways in the slave ring align the corresponding cutaways in the build stand adapter plate. Place the two halves of the platform (Tool 1929) around the stand pedestals, then place the tray (Tool 1930) on the platform.
- (2) Turn the slave ring until the TOP position is 90 deg to the build stand pillar.
- (3) Lock the slave ring with the two locking screws positioned through the rear of the adapter plate flange.

NOTE: The front of the case can be readily identified by the larger leading edge section of the vanes.

- (4) Attach the multiple leg sling (Tool 1089) to three equally spaced positions on the front flange of the outer case and secure with six thumbscrews, then attach a hoist to the sling.
- (5) Raise the intermediate case above the build stand, then turn the case until its TOP position marked on the flange periphery, aligns with the TOP position marked on the slave ring. Lower the case

onto the slave ring and secure with slave washers and nuts. Release and remove the hoist and sling.

NOTE: Should the case not have a position marked TOP, take the No.1 vane position which is marked on the flange periphery as TOP.

### 3. Assemble Inner Case to Outer Case (Ref.Fig.511 and 512)

NOTE: Assistance will be required for this operation. The drain tube and plate retainer at the No.4 vane inner location and the inner blanking plate at the No.1 vane location will require placing into position from within the outer case, and supported while the inner case is assembled to the outer case.

#### A. Assemble Drain Tube and Blank.

- (1) Release the build stand lock, then turn the build stand until the rear face of the outer case is uppermost.
- (2) Insert a bolt (5-240) through the blanking plate (5-220) so that the bolt threads protrude the same side of the plate as the four assembled anchor plates.
- (3) Apply lubricant 'A' to the threads of the bolt, then secure the bolt to the plate with a nut (5-230).
- (4) Torque-tighten the bolt to 135 lbf in. (15,2 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).
- (5) Assemble a slave bar (Tool 1805) to the central bolt (5-240) attached to the blanking plate (5-220). Insert the slave bar from within the outer case into No.1 vane. Temporarily support the blanking plate against the inner wall of the case by holding the bar outside of the case then retain the plate with the slave thumbnut.
- (6) Apply a light smear of jointing compound 'C' or 'D' to the seal spigot of the drain tube (4-260), then assemble it from within the case through No.4 vane of the outer case, so that the orifice at the curved end of the tube faces to the rear of the case. Temporarily support the tube in this position.
- (7) Ensure that the slave bolts and nuts securing the housing (5-380) are removed from the outer sub-assembly (5-420). The bolts occupy the positions of the drain tube retaining bolts assembled later.

B. Assemble Inner Case.

- (1) Screw three pullers (Tool 1668) at equidistant positions in to the extraction positions in the rear flange of the inner case (5-420) so that the threads protrude about 1.0 in. (25,40 mm) through the flange.
- (2) Identify the locating peg on the rear inner flange of the outer case (between No.2 vane and No.3 vane) then lift the inner case onto the outer case aligning the locating peg with the corresponding small hole in the inner case rear flange. The three pullers should now be resting in the extraction recesses.

C. Secure Drain Tube and Blanking Plate.

- (1) Assemble the drain tube retainer (4-255) to the housing (5-380) in the inner case at No.4 vane. Ensure that the cut-away in the retainer aligns the drain hole in the housing.
- (2) Apply lubricant 'A' to the threads of a bolt (4-300) then assemble the bolt to the TOP of the retainer opposite the drain hole, the head of the bolt facing outboard. Secure the bolt with a nut (4-270), but do not tighten at this stage.
- (3) Unscrew and remove the three pullers from the inner case, then locate the inner case on the location dowels and tap the case onto its abutment flange with a suitable mallet. Secure the inner case outer assembly (5-420) rear flange to the rear inner flange of the outer case (6-100) with slave bolts and washers.
- (4) Apply lubricant 'A' to the threads of seven bolts (4-280) and two bolts (4-290), then assemble the bolts to the retainer with the boltheads facing inboard. Screw self-locking nuts (4-270) onto the bolts leaving them finger-tight.
- (5) Locate the setting tool (Tool 1806) on the rear flange of the intermediate case at the drain tube (4-260) position and secure. Align the drain tube with the setting tool.
- (6) Using the holding tool (Tool 1947) tighten two, diametrically opposite, drain tube retaining bolts, then check the alignment of the drain tube with the setting tool.

SUB-ASSEMBLY

72-32-00

Page 530

OVERHAUL

- (7) Tighten the remaining bolts, then recheck the alignment of the drain tube and setting tool. If the alignment is satisfactory, then torque-tighten the ten bolts 135 lbf in. (15,2 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m). Remove the alignment tool.

#### D. Secure Inner Case to Outer Case.

- (1) Secure the blanking plate (5-220) with two bolts (5-250) lubricated with lubricant 'A' and two tubes (5-270) and two bolts (5-260) lubricated with lubricant 'A'.
- (2) Torque-tighten the bolts to 135 lbf in. (15,2 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).
- (3) Assemble the fire cover (6-25) to the outer location of No.1 vane, with the long section of the bracket extended towards the outer case rear flange.
- (4) Apply lubricant 'A' to four bolts (6-23) then secure the bracket. Torque-tighten the bolts to 135 lbf in. (15,2 N.m). Wire-lock each of the bolts to the bracket.
- (5) Using the build stands cranked handle, turn the stand until the front face of the case is uppermost, then secure the inner case to the outer case at the front location with bolts (5-300) lubricated with lubricant 'A' (boltheads to face the front), and nuts (5-290). Using wrench (Tool 1576) torque-tighten the bolts to 135 lbf in. (15,2 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).

#### E. Assemble Tube Unit to No.6 Vane.

- (1) Ensure that the flange and splines of the tube unit (4-440) are clean and free from damage, apply lubricant 'H' (dry film lubricant) to the mating face of the tube, then assemble the tube to its location in No.6 vane.

SUB-ASSEMBLY

## 72-32-00

Page 531

Dec 31/01

OVERHAUL

sneema

- (2) Apply lubricant 'A' to two special bolts (4-450), then assemble the bolts (finger-tight) to the inner case and flange.
- (3) Assemble a locating plate (4-410) and fire cover (4-420) to the outer case location of No.6 vane, carefully engaging the splines, and the two locating pins (4-430). Lubricate four bolts (4-400) with lubricant 'B' and secure the locating plate to the outer case.
- (4) Using wrench (Tool 1521), torque-tighten the two bolts (4-450) at the inner case location to 135 lbf in. (15,2 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).
- (5) Torque-tighten the four bolts (4-400) at the outer case location between 85 and 95 lbf in. (9,6 and 10,7 N.m), then wire-lock the four bolts.

#### 4. Determine Thickness of LP and HP Oil Thrower Adjusting Washers

NOTE: For dimensional checks on engines to pre-SB.72-21 and pre-SB.72-29, refer to para. C, D, E and F, then continue with para.5 onwards as for normal build.

##### A. Determine Thickness of the LP Bearing Oil Thrower Adjusting Washer (SB.72-21 standard) (Ref.Fig.513).

- (1) If the LP thrust washer (1-300) has not been assembled, refer to para.2.S.(1) and (2) for the procedure to calculate its correct thickness. Identify the offset pin position of the thrust washer location in the LP bearing housing (1-270) and the corresponding offset position of the LP thrust washer. Mark both items with an approved marker.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

sneema

- (2) Using an approved freezing agent and wearing protective gloves, assemble the correct thickness (Ref.para.2.S.(2), thrust washer (1-300) to the bearing housing (1-270).
- (3) Remove the slave LP bearing (Tool 1807) from its protective container (Tool 1808). Ensure that the bearing is clean, then apply a small quantity of lubricant 'A' to the outer diameter.
- (4) Ensure that the thrust washer is seating correctly, wipe the bearing housing clean, then apply a small quantity of lubricant 'A' to the wall of the bearing housing.
- (5) Assemble the slave bearing to the housing, temporarily support the bearing housing, then assemble the gauge (Tool 81) and clamp assembly (Tool 1809) to the slave bearing and housing locating the clamp assembly on the inner labyrinth seal (1-330).
- (6) Tighten the thumbnut on the clamp assembly to take up the end-float, but do not overtighten causing the possibility of seal deflection.
- (7) Using the stand handle, turn the intermediate case until the front flange is uppermost.
- (8) Identify the TOP position of the LP bearing housing, and the corresponding TOP position in the intermediate case, then assemble the bearing housing/gauge and clamp assembly to the intermediate case, locating them on the pins.
- (9) Using a suitable mallet, tap the bearing housing onto its abutment face, then retain with slave bolts and washers.

OVERHAUL

- (10) Clean the front face of the front flange of the intermediate case and lightly stone if necessary, then assemble two machine blocks to the flange positioning them diametrically opposite each other. Position a straight edge across the blocks.
- (11) Using a vernier depth gauge, measure from the front face of the outer flange of the intermediate case, to the front face of the slave LP bearing inner track. Obtain a measurement from the opposite side of the slave bearing, then reposition the two blocks and the straight edge to obtain two more readings at 90 deg to the first readings. Determine the mean dimension from the four results, then record this as Dimension A.
- (12) The required LP oil thrower (1-200) thickness = 2.835 in. (72,009 mm) - Dimension A  $\pm$  0.001 (0,0254 mm) machining tolerance.
- (13) Select the correct thickness oil thrower (1-200) (72-09-21 Repair, Fig.405) from the range, then record the thickness on the appropriate engine record sheet.
- (14) Remove the straight edge and machined blocks from the intermediate case, then remove the slave bolts and washers from the bearing housing.
- (15) Assemble a puller (Tool 1668) to each of the six shouldered pin positions at the outer location of the LP bearing housing.
- (16) Turn each puller in equal increments until the housing is free of its pins, then remove the housing, slave bearing gauge and clamp assembly and place on a worktop. Remove the gauge clamp assembly and slave bearing. Remove the pullers and place in a container. Place the items in their respective containers.
- (17) Position the LP bearing housing on the worktop with the inner labyrinth seal face down.

OVERHAUL

- (18) Rest the correct thickness oil thrower (1-200) on the labyrinth seal ensuring that the extended shroud section of the thrower is nearest the seal.
- (19) Remove the LP bearing (1-190) from its protective container, then place the bearing on a clean surface. Turn the inner tracks so that the thrust arrows correlate and point forward (Ref.Fig.514).

NOTE: The rear of the bearing can be identified by the castellated projections on its rear outer track.

- (20) Apply a small quantity of lubricant 'A' to the bearing outer track, then holding the bearing square, assemble the bearing with the arrows pointing downwards to the bearing housing (1-270).
- (21) Assemble the bearing retaining ring (1-170), correctly locating it on the pins, to the bearing housing. Temporarily retain the ring with 12 bolts.
- (22) Place the bearing housing assembly in a protective container, then pass the assembly to the LP compressor section (72-31-00) for LP probe gauge checks.

B. Determine Thickness of the HP Oil Thrower Adjusting Washer (SB.72-29 Standard) (Ref.Fig.515).

- (1) Using the stand handle, turn the build stand until the rear flange of the intermediate case is uppermost. Assemble the lifting fixture (Tool 1810) to No.1 and 4 vanes of the outer case, then connect the overhead hoist to the lifting fixture.
- (2) Position a pallet beneath the intermediate case, then carefully take the weight of the case with the hoist. Remove the slave bolts and washers securing the intermediate case to the build stand. Mark the stand and intermediate case for position for reassembly convenience.

- (3) Lower the intermediate case onto the pallet, then disconnect the hoist from the lifting fixture.
- (4) Withdraw the pallet and intermediate case from beneath the build stand, reassemble the hoist to the lifting fixture, then raise the intermediate case and locate it on a surface table with the rear face uppermost. Disconnect the hoist.
- (5) If the oil baffle (2-100) has not been assembled, refer to para.2.T.(1) and (2) for the procedure to calculate its correct thickness and (3) for cleaning prior to assembly.
- (6) Identify the offset pin position of the oil baffle location in the HP bearing housing (2-80), and the corresponding offset position of the HP oil baffle. Mark the offset positions of both items with an approved marker.
- (7) Using an approved freezing agent and wearing protective gloves, assemble the correct thickness oil baffle (2-100) to the HP bearing housing (2-80).
- (8) Identify the TOP position of the HP bearing housing and the corresponding TOP position in the intermediate case, then assemble the bearing housing to the intermediate case, locating it on the pins. Use a suitable mallet and tap the bearing housing onto its abutment face. Retain the bearing housing with slave bolts and washers.
- (9) Remove the slave bearing (Tool 1807) from its protective container (Tool 1808), ensure that the bearing is clean, then apply a small quantity of lubricant 'A' to its outer diameter.
- (10) Clean the bearing area of the HP bearing housing (2-80) with a cloth, then apply a small quantity of lubricant 'A' to the wall of the housing.

OVERHAUL

- (11) Assemble the slave bearing to the housing, then assemble the loading tool (Tool 1822) to the slave bearing.
- (12) Clean the rear outer flange of the intermediate case, lightly stone if necessary.
- (13) Position two machine blocks diametrically opposite each other on the rear outer flange, then position a straight edge across the blocks.
- (14) Using a vernier depth gauge, measure the distance from the rear face of the outer rear flange of the intermediate case to the rear face of the slave bearing inner track, record the dimension. Repeat the check on the opposite side of the slave bearing and record the dimension.
- (15) Reposition the blocks and straight edge 90 deg, then obtain two more readings and record the dimensions.
- (16) Determine the mean dimension from the four results, then record this figure and log it on the engine record sheets as Dimension C.
- (17) The required HP oil thrower (2-120) thickness =  $\text{Dimension C} - 0.812 \text{ (20,624 mm)} \pm 0.001 \text{ in. (0,0254 mm)}$  machining tolerance. Select the correct thickness oil thrower (2-120) (72-09-21 Repair, Fig.406) then record its actual thickness on the appropriate record sheet.
- (18) On completion of the dimensional check, remove the loading tool and slave bearing and place the items in protective containers.
- (19) Remove the slave bolts and washers retaining the HP bearing housing to the intermediate case, then assemble a puller (Tool 1668) to each of the locating pin positions at the outer location of the HP bearing housing.

OVERHAUL

- (20) Turn each puller in equal increments until the housing is free of its pins, then remove the housing from the intermediate case.
  - (21) Connect the overhead hoist to the lifting equipment already assembled to No.1 and 4 vanes, then remove the intermediate case from the worktop and lower onto the pallet. Disconnect the hoist, reposition the pallet and intermediate case beneath the build stand, then reconnect the hoist to the lifting equipment.
  - (22) Carefully raise the intermediate case making any necessary adjustment to locate the case in its original location marked previously.
  - (23) Secure the intermediate case to the build stand with the slave bolts and washers. Disconnect the hoist, then remove the lifting equipment.
- C. Determine B Dimension (Pre-SB.72-21 Standard) (Ref. Fig.516).
- (1) Obtain the engines exit guide cases (72-31-02/1-150) from the LP compressor section. Ensure that the cases are a matched pair.
- NOTE: The exit guide cases may be used for the dimensional check with or without their vanes assembled.
- (2) Using the build stands cranked handle turn the intermediate case front flange uppermost.
  - (3) If the thrust washer (1-300) has not been assembled to the bearing housing (1-270) refer to para.2.S.
  - (4) With the thrust washer correctly assembled to the bearing housing, apply a small quantity of lubricant 'A' to the wall of the bearing housing.

SUB-ASSEMBLY

72-32-00

Page 541

MK.610-14-28

OVERHAUL

- (5) Remove the LP thrust bearing (1-190) from its protective container and place on a clean surface, rear face uppermost (Ref.Fig.514).
- (6) Apply a small quantity of lubricant 'A' to the outside diameter of the outer track.
- (7) Rest the oil thrower, pre-SB.72-21 standard, (1-200A) on the inner labyrinth housing (1-330) already assembled to the bearing housing. Ensure that the oil thrower is assembled with its extended outer diameter facing forward.
- (8) Place the front inner track (Ref.Fig.514) of the thrust bearing onto the oil thrower.
- (9) Keeping the bearing square above the housing, assemble the bearing to the housing.
- (10) Identify the TOP position of the bearing retainer (1-170), then locate it on the shouldered pins. Lightly tap the retainer into position and temporarily retain it with 12 bolts (1-160).
- (11) Remove the gauge (Tool 81) from the clamp (Tool 1199), then assemble the gauge to the rear bearing inner track. Raise the bearing and gauge assembly over the clamp, locating the clamp bolt through the gauge. Locate the clamp correctly on the bearing housing then secure. Tighten the gauge thumbnut to take up the bearing end-float, ensuring that the thrust is fully forward.
- (12) Observe the TOP position of the bearing housing and identify it with a suitable marker, then invert the bearing/gauge assembly so that the clamp is uppermost.

SUB-ASSEMBLY

**72-32-00**

Page 542

Jul 1/76

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (13) Note the corresponding TOP position on the intermediate case, then assemble the bearing/gauge assembly to the intermediate case locating it correctly on the dowels. Tap the assembly onto the case flange then temporarily retain with bolts.
- (14) Ensure that the front and rear flanges of the exit guide cases (72-31-02/1-150) are clean and free from nicks and burrs, then assemble both half cases to the intermediate case front flange so that the rear flange of the cases abut the front flange of the intermediate case.
- NOTE: The e.g.v. rear flange can be quickly identified by the vane groove, which is nearest the rear flange.
- (15) Position the cases so that the dowel hole in the e.g.v. bottom half case aligns the corresponding dowel hole in the intermediate case flange (close to No.4 vane), then temporarily secure the e.g.v. case at their axial positions with bolts (72-31-02/1-20) and nuts (72-31-02/1-10) and to the intermediate front flange with slave nuts and bolts.
- (16) Assemble machine blocks diametrically opposite each other to the rear outer flange of the e.g.v. then rest the straight edge on the blocks.
- (17) With the bearing end-float loaded forward, measure from the front face of the e.g.v. case flange to the front face of the oil thrower, record the dimension. Repeat the check on the opposite side of the oil thrower.
- (18) Reposition the blocks and straight edge 90 deg, then obtain two more readings and record the dimensions. Remove the straight edge and blocks.

- (19) Determine the mean dimension from the four results, then log the figure in the appropriate engine record sheets as dimension B.

NOTE: The LP compressor section (72-31-00 Sub-Assembly will require the dimension to assist them to calculate their engine adjusting washer.

D. Prepare the LP Bearing Assembly for Probe Gauge Checks.

- (1) Remove the bolts and nuts temporarily securing the e.g.v. cases, place the cases on a pallet and return them to 72-31-00 Sub-Assembly.
- (2) Disassemble the bolts temporarily securing the LP bearing housing assembly to the intermediate case.
- (3) Assemble a puller (Tool 1668) to each of the extraction positions (nearest the dowels) in the bearing housing. Turn each puller in small increments until the bearing housing is free of the dowels.
- (4) Carefully lift the bearing housing assembly from the intermediate case and place on the worktop.

CAUTION: SUPPORT THE BEARING REAR INNER TRACK WHEN DISASSEMBLING GAUGE.

- (5) Remove the pullers, then carefully disassemble the clamp and gauge from the bearing and housing.
- (6) Assemble the gauge and clamp together then place in a container.
- (7) Ensure that the bearing rear inner track is located in the bearing correctly, then assemble the bearing retainer (Tool 434) to the bearing and oil thrower, secure the retainer with the thumbnut.

OVERHAUL

- (13) Assemble the oil thrower, Pre-SB.72-29 standard (2-120A) to the bearing. Ensure the outside diameter of the thrower extends rearward.
- (14) Assemble the inner labyrinth housing (2-60) observing the TOP position, then temporarily secure the retaining ring and labyrinth housing with bolts (2-50).
- (15) Assemble the loading tool (Tool 1822) to the HP bearing and oil thrower ensuring that the thrust is fully forward for the dimensional check.
- (16) Clean the rear outer flange of the intermediate case, lightly stone if necessary.
- (17) Position two machine blocks diametrically opposite each other on the rear outer flange, then position a straight edge across the blocks.
- (18) Using a vernier depth gauge, measure the distance from the rear face of the outer rear flange of the intermediate case to the rear face of the oil thrower (Ref.Fig.517), record the dimension. Repeat the check on the opposite side of the oil thrower and record the dimension.
- (19) Reposition the blocks and straight edge 90 deg, then obtain two more readings and record the dimensions.
- (20) Determine the mean dimension from the four results, then record this figure and log it on the engine record sheets as Dimension C.
- (21) On completion of dimensional checks remove the straight edge and machine blocks.

F. Disassemble Items Used for Dimensional Check and Reassemble Intermediate Case to Build Stand.

- (1) Remove the loading tool and place in a container.

F. Assemble HP Bearing Housing and Setting Gauge to Case (Ref.Fig.519).

- (1) Identify the offset pin in the HP bearing housing (2-80). Using a suitable freezing agent and wearing protective gloves shrink the oil baffle (2-100) into the HP bearing housing (if not already assembled).
- (2) Assemble the HP bearing housing (2-80) to the inner case, aligning the TOP of the housing with the TOP of the case. Ensure that the shouldered pins assembled to the inner case align correctly with the corresponding holes in the bearing housing, then lightly tap the housing onto its abutment flange.
- (3) Secure the HP bearing housing with the spacer ring (Tool 251) and six slave washers and captive bolts.
- (4) Assemble the setting gauge (Tool 1813) to the HP bearing housing (2-80) and secure with the clamping plate (Tool 253) and four waisted thumbscrews (Ref.Fig.522).
- (5) Take up the end-float of the gauge (Tool 1813) with the clamp plate clamping screws, do not overtighten the screws.
- (6) Using the build stand handle, rotate the intermediate case until the front face of the case is uppermost.

G. Determine Thickness of HP Driving Gear Adjusting Washer (Ref.Fig.520).

- (1) Using slip gauges measure dimensions X1 and X2 and record.
- (2) If the discrepancy between dimensions X1 and X2 is greater than 0.005 inch, this is unacceptable and the findings should be referred to Rolls Royce for investigation.
- (3) If the discrepancy between dimensions X1 and X2 is 0.005 inch or below, calculate the mean dimension X.

$$\text{i.e.} \quad X = \frac{X1 + X2}{2}$$

- (4) The HP driving bevel gear adjusting washer (72-61-00/1-50) thickness =  $X + 2.700$  in. (72,580 mm) - M.D.

NOTE: M.D. is the mounting distance marked on the respective bevel gear, and 2.700 in. (72,580 mm) is the theoretical gauge dimension.

CAUTION: ADJUSTING WASHER (72-61-00/1-50) IS CASE HARDENED. NO MACHINING PERMISSIBLE.

- (5) Select the required thickness adjusting washer (72-61-00/1-50) from the range, then suitably identify the washer.

H. Determine Thickness of Right-hand Driven Bevel Gear Adjusting Washer (Ref. Fig. 520).

- (1) Engines to pre-S.B.72-8697-286 standard.

- (a) Using slip gauges, measure dimension Y and record.  
(b) The right-hand driven bevel gear adjusting washer (72-61-00/1-470) thickness =  $Y + 4.480$  in. (113,792 mm) - M.D.

NOTE: M.D. is the mounting distance marked on the respective bevel gear and 4.480 in. (113,792 mm) is the theoretical gauge dimension.

- (2) Engines to S.B.72-8697-286 standard.

- (a) Using slip gauges, measure dimension Y and record.  
(b) Measure the thickness of the damping plate (72-61-00/1-565) at the bore, and record.  
(c) The right-hand driven bevel gear adjusting washer thickness =  $Y + 4.480$  in. (113,792 mm) - damper plate thickness - M.D.

NOTE: M.D. is the mounting distance marked on the respective bevel gear and 4.480 in. (113,792 mm) is the theoretical gauge dimension.

OVERHAUL

- (3) Select the required thickness adjusting washer (72-61-00/1-470) (72-09-21 Repair, Fig.424), then suitably identify the washer.

J. Determine Thickness of Left-hand Driven Bevel Gear Adjusting Washer (Ref.Fig.520).

- (1) Engines to pre-S.B.72-8784-307 standard.

- (a) Using slip gauges, measure dimension Z and record.
- (b) The left-hand driven bevel gear adjusting washer (72-61-00/1-210) thickness =  $Z + 4.320$  in. (109,728 mm) - M.D.

NOTE: M.D. is the mounting distance marked on the respective bevel gear and 4.320 in. (109,728 mm) is the theoretical gauge dimension.

- (2) Engines to S.B.72-8784-307 standard.

- (a) Using slip gauges measure and record dimension Z.
- (b) Measure and record the thickness of the damping plate (72-61-00/1-175) at the bore (dimension A).
- (c) Record the thickness of the slave adjusting washer used (dimension B).
- (d) The left-hand driven bevel gear adjusting washer (72-61-00/1-210) thickness =  $Z + 4.320$  in. (109,728 mm) - M.D. + dimension B - dimension A.

NOTE: M.D. is the mounting distance marked on the respective bevel gear and 4.320 in. (109,728 mm) is the theoretical gauge dimension.

- (3) Select the required thickness adjusting washer (72-61-00/1-210) (72-09-21 Repair, Fig.422), then suitably identify the washer.

OVERHAUL

## K. Disassemble Accessory Items After Gauging Checks.

- (1) Rotate the build stand until the rear of the intermediate case is uppermost. Remove the retaining plate (Tool 253) securing the gauge to the bearing housing (2-80), then withdraw the gauge. Place the gauge and plate in the container (Tool 270).
- (2) Remove the bolts retaining the housing to the inner case. Assemble six pullers (Tool 1668) to the threaded extraction positions in the bearing housing close to the dowels. Turn each puller in turn, in small increments and extract the housing from the dowels.

**CAUTION:** AVOID TURNING THE PULLERS IN LARGE INCREMENTS OBVIATING POSSIBLE DOWEL DAMAGE AND BOWING OF THE BEARING HOUSING FLANGE.

- (3) Remove the HP bearing housing from the inner case then remove the pullers from the housing.
- (4) Release the thumbscrews securing the gauge at No.5 vane, then withdraw the gauge and ball bearing housing from the inner case. Remove the roller bearing, spacer sleeve, bearing housing (complete with bearing and oil catcher ring) and the slave adjusting washer from the gauge, then place the gauge in the container (Tool 270).
- (5) Release the thumbscrews securing the gauge at No.3 vane, then withdraw the gauge and roller bearing housing from the inner case. Remove the roller bearing, adjusting washer (72-61-00/1-410) and outer spacer from the gauge, then place the gauge in the container (Tool 270).

## L. Assemble Housing Support to Sump and Sump to Inner Case (Ref.Fig.521).

- (1) Assemble the housing support (72-61-00/2-210) to the oil sump (4-360), then using the wrench (Tool 1582), secure the support with two bolts (72-61-00/2-200) lubricated with lubricant 'B'. Torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).

OVERHAUL

- (2) Assemble sump to inner case SB.0L593-72-9053-426 Standard. Ensure that the seal location for 'C' seal (4-390) is clean. Check that the locating pegs are assembled to the sump location flange in the inner case. Assemble the seal to the sump (4-360). Assemble the sump to its correct position in No.4 vane and secure with bolts (4-370) lubricated with lubricant 'A'. Torque-tighten the bolts to 135 lbf in. (15,2 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).
- M. Determine Adjusting Washer Sizes for LP Driving Bevel Gear and LP Driven Bevel Gear (Ref.Fig.522).
- (1) Using a driver (Tool 350) and support (Tool 351) press the ball bearing (72-61-00/2-170), distance piece outer (72-61-00/2-160) and the outer track of the roller bearing (72-61-00/2-140) into the bearing housing (72-61-00/2-180). Assemble the

distance piece inner (72-61-00/2-150) and the roller bearing inner (72-61-00/2-140) to the bearing housing (72-61-00/2-180), then secure the items by assembling the retaining ring (72-61-00/2-130) to the housing.

- (2) Assemble the setting gauge (Tool 31) to the bearing housing (72-61-00/2-180).
- (3) Assemble the bearing housing to the sump unit (4-360) at the inner location of No.4 vane and temporarily retain the housing with bolts (72-61-00/2-190).
- (4) Assemble the extension (Tool 935) through No.4 vane to the gauge and hand tighten sufficiently to take up the end-float of the bearings.
- (5) Assemble the gauge (Tool 41) in conjunction with the clamp assembly (Tool 1809) to the LP bearing housing (1-270) and secure with the thumbnut.
- (6) Using the stand handle rotate the build stand until the front flange is uppermost, then assemble the LP bearing housing (1-270) with the assembled gauge to the inner case, locating the LP bearing housing in its correct TOP position aligned with the engine TOP. Secure the LP bearing and gauge assembly to the inner case with slave bolts and washers.
- (7) Check that the M.D. marked on the LP driving gear (1-40) = 2.625 in. (66,675 mm) (SB.72-21), or 2.621 in. (66,573 mm) (Pre-SB.72-21). Record the M.D. dimension.

NOTE : M.D. (mounting distance) is the dimension marked on the gear (1-40) and the 2.600 in. (66,040 mm) dimension used in the calculation is the theoretical gauge dimension.

- (8) Using slip gauges, determine dimension X and record the dimension obtained. The LP driving bevel gear adjusting washer (1-50) thickness =  $X + 2.600$  in. (66,040 mm) - M.D. Select the correct thickness adjusting washer (1-50) (72-09-21 Repair, Fig.404) from the range, then record its actual thickness on the appropriate record sheet.
- (9) Record the M.D. of the LP driven gear (72-61-00/2-20).

NOTE: M.D. (mounting distance) is the dimension marked on the driven bevel gear (72-61-00/2-20) and the 4.765 in. (121,031 mm) dimension used in the calculation is the theoretical gauge dimension.

- (10) Using slip gauges determine dimension Y and record the dimension obtained.
- (11) The LP driven gear adjusting washer (72-61-00-2-30) thickness =  $Y + 4.765$  in. (121,031 mm) - M.D. Select the correct thickness adjusting washer (72-61-00/2-30) (72-09-21 Repair, Fig.425) from the range, then record its actual thickness on the appropriate record sheet.
- (12) After the gauging checks, remove the LP bearing housing, gauge and clamp assembly, then remove the extension, bearing housing (LP pulse probe) and gauge. Place the bearing housing in the container (Tool 343).

6. Assemble Oil Feed Housing and Bearing Failure Tube Unit  
(Ref.Fig.523)

A. Assemble Seal, Housing, Tube and Location Plate.

- (1) Lubricate the pack sealing ring (4-90) with lubricant 'A', then assemble the sealing ring to the oil feed housing (4-60), ensuring that the sealing ring gaps are equally distributed.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

sneema

- (2) Install housing.
  - (a) Install a 'C' seal to SB.0L593-72-9053-426 Standard. Ensure that the seal location for 'C' seal (4-80) is clean, then assemble it over the oil feed housing (4-60).
  - (b) Assemble the housing to its location in No.2 vane of the inner case, align it with the pegs, then press the housing into position, ensuring that the 'C' seal is correctly located in its groove. Temporarily secure the housing with bolts (4-70).
- (3) Lubricate the sealing ring pack (4-110) with lubricant 'A', then assemble the pack to the bearing failure warning tube (4-100).
- (4) Lubricate the nut on the bearing failure tube with lubricant 'A', then assemble the tube from outside the outer case through No.2 vane to locate the oil feed housing bolted to the inner case. Run down the nut on the bearing failure tube using the wrench (Tool 1494) but do not tighten, allowing the tube to rotate sufficiently to engage the splines on the location plate (4-20) assembled in the following operation.
- (5) Assemble the location plate (4-20) and fire cover (4-30) manipulating it to engage the splines of both the oil feed housing tube and the bearing failure warning tube, and simultaneously aligning it with the two locating pins assembled to the outer case. Lightly tap the location plate home, then secure it with four bolts (4-10) lubricated with lubricant 'A'. Torque-tighten the bolts to 135 lbf in. (15,2 N.m), then wire-lock the four bolts.

- (6) Using the wrench (Tool 1494) and adapter (Tool 849) determine on the torque setting rig the compensated torque value for 220 and 240 lbf in. (24,8 and 27,1 N.m).
- (7) Using the wrench (Tool 1494), torque-tighten the nut securing the bearing failure tube to the oil feed housing between 220 and 240 lbf in. (24,8 and 27,1 N.m). This will be the actual torque value required on the nut.
- (8) Remove the bolts (4-70) temporarily securing the oil feed housing, then partially withdraw the housing from the inner case and wire-lock the nut on the bearing failure tube.
- (9) Carefully reassemble the oil feed housing and bearing failure tube as a unit (ensuring that the seal seats correctly), to the locating pins in the inner case, and at the same time engaging the splines of both tubes with the corresponding splines in the location plate. Lightly tap the assembly home, then secure with the bolts (4-70) lubricated with lubricant 'A'. Torque-tighten the bolts to 135 lbf in. (15,2 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).
- (10) Assemble protectors (Tool 568) and (Tool 1365) to the oil feed housing and the bearing failure tube.

7. Assemble HP Air Baffle Assembly to the Inner Case  
(Ref.Fig.524)

A. Assemble Air Baffle.

- (1) Identify the TOP position marked on the air baffle (2-240), then using an approved freezing agent and wearing protective gloves, freeze the baffle for a suitable period. Using the alignment fixture (Tool 930) assemble the baffle, lining up the TOP of the inner case with the TOP of the baffle. Remove the alignment fixture from the inner case.

8. Final Assembly of the LP Internal Accessory Drive (LP Pulse Probe Drive (Ref.Fig.525)

A. Assemble and Secure the Bevel Gear and Housing.

MK.610-14-28

OVERHAUL

- (1) Assemble the correct size adjusting washer (72-61-00/2-30) calculated previously (Ref.5.M.(11)) to the bevel gear (72-61-00/2-20), then using the driver (Tool 1514) and support (Tool 354), assemble the bevel gear to the bearing housing (72-61-00/2-180).
- (2) Ensure that the self-locking feature of the retaining nut (72-61-00/2-10) is elliptical and not four lobed (Ref.S.B.72-105) then apply lubricant 'A' to the nut and screw it onto the bevel gear (72-61-00/2-20). Using the holder (Tool 356) and wrench (Tool 1516), record the locking (run-down) torque of the nut, this should be between 6 and 50 lbf ft (8,1 and 67,8 N.m). Torque-tighten the nut to 60 lbf ft (81 N.m), then add the recorded locking torque to this figure.
- (3) Assemble the bevel gear and bearing housing unit to its correct location at No.4 vane position in the inner case.
- (4) Apply lubricant 'B' to bolts (72-61-00/2-190), then secure the bearing housing (72-61-00/2-180) to the sump and inner case. Torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m) using the wrench (Tool 1581). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).

NOTE: If preferred at this stage, the backlash check of the LP bevel gears may be carried out, in which case refer to para.11.A. This would obviate the need to remove one of the HP bevel gears at a later stage to facilitate LP bevel gear washer adjustment, should the need arise, after which the build would proceed normally under para.9.

9. Final Assembly of Right-hand Internal Accessory Drive  
(Ref.Fig.526)

A. Assemble and Secure Items to Gear.

- (1) On engines to S.B.72-8697-286 standard, assemble the damping plate (72-61-00/1-565) to the gearshaft.
- (2) Apply lubricant 'B' to four bolts (72-61-00/1-350), then temporarily assemble the bolts to the flange of the roller bearing housing (72-61-00/1-560), ensuring that the boltheads face the gear.

- (3) Using driver (Tool 1496) and support (Tool 256), assemble the roller bearing assembly (72-61-00/1-560) to the driven bevel gear (72-61-00/1-42).
- (4) Assemble the correct size adjusting washer (72-61-00/1-470) calculated previously (Ref. para. 5.H.(2)) to the bevel gear.
- (5) Assemble the correct size adjusting washer (72-61-00/1-410) calculated previously (Ref. para. 2.V.(3)) to the roller bearing (72-61-00/1-560). Assemble the sleeve outer (72-61-00/1-400) and sleeve inner (72-61-00/1-390) to the roller bearing outer and bevel gear shaft.
- (6) Using driver (Tool 1496) and support (Tool 256), assemble the ball bearing (72-61-00/1-380) and roller bearing (72-61-00/1-370) to the gear shaft.
- (7) Ensure that the self-locking feature of the retaining nut (72-61-00/1-360) is elliptical and not four lobed (Ref. S.B.72-105) then apply lubricant 'A' to the nut and screw it onto the gear shaft (72-61-00/1-42). Using the holder (Tool 256) and wrench (Tool 1497), record the locking (run-down) torque of the nut, this should be between 10 and 67 lbf ft (13,6 and 90,8 N.m). Torque-tighten the retaining nut (72-61-00/1-360) to 120 lbf ft (163 N.m), then add the recorded locking torque to this figure.

B. Assemble Accessory Gear to Inner Case (Ref. Fig. 527).

- (1) Assemble the bevel gear assembly to the right-hand drive housing assembled to No.3 vane. Secure the assembly with the four bolts (72-61-00/1-350). Torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m) using wrench (Tool 1629). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).

- (2) Check that the bevel gear rotates freely.

10. Final Assembly of the Left-hand Accessory Drive  
(Ref. Fig. 528)

- (1) Apply lubricant 'B' to four bolts (72-61-00/1-180), then temporarily assemble the bolts to the flange of the bearing housing (72-61-00/1-200) ensuring that the boltheads face the gear.
- (2) On engines to pre-S.B.72-8784-307 standard, assemble items to gear.
- (a) Using driver (Tool 323) and support (Tool 256), assemble the previously calculated adjusting washer (72-61-00/1-210) (Ref.para.5.J.(2)), ball bearing (72-61-00/1-290), housing (72-61-00/1-200) and spacer sleeve (72-61-00/1-300) to the gear (72-61-00/1-43).
- (3) On engines to S.B.72-8784-307 standard, assemble items to gear.
- (a) Using driver (Tool 323) and support (Tool 256), assemble the damping plate (72-61-00/1-175), the previously calculated adjusting washer (72-61-00/1-210), the bearing housing (72-61-00/1-200) complete with the oil catcher ring and bearing, and the spacer sleeve (72-61-00/1-300) to the gear (72-61-00/1-43).
- (4) Ensure that the self-locking feature of the retaining nut (72-61-00/1-190) is elliptical and not four lobed (Ref.S.B.72-105). Apply lubricant 'A' to the retaining nut, then assemble the roller bearing inner race (72-61-00/1-320) and retaining nut to the gear shaft (72-61-00/1-43). Using the holder (Tool 256) and wrench (Tool 327), record the locking (run-down) torque of the nut, this should be between 9 and 60 lbf ft (12,2 and 81,4 N.m). Torque-tighten the retaining nut (72-61-00/1-190) to 90 lbf ft (122 N.m), then add the recorded locking torque to this figure.

B. Assemble Accessory Gear to Inner Case (Ref.Fig.527).

- (1) Check that the outer track of the roller bearing (72-61-00/1-320), secured by a retaining ring (72-61-00/1-310), is in position in the left-hand drive housing in No.5 vane.

- (2) Assemble the bevel gear with its correctly assembled items to the left-hand drive housing in No.5 vane, taking care not to damage the exposed rollers on the gear shaft. Secure the assembly with the four bolts (72-61-00/1-180), then torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).
- (3) Check that the bevel gear rotates freely.

# 11. Check Backlash of Internal Accessory Drives

## A. Check Backlash of the LP Drive Gears (Ref.Fig.529).

- (1) Assemble a setting gauge (Tool 41) to the LP bearing housing (1-270), and secure the gauge with the clamp assembly (Tool 1199).
- (2) Assemble the selected adjusting washer (Ref.para. 5.M.(8)) and bevel gear (1-40) to the gauge, then retain with the special nut (Tool 635).
- (3) Assemble a clock mounting plate, quill and collet (Tool 359, 357 and 358) to the casing and gear at No.4 vane.
  - (a) Assemble the clock mounting (Tool 359) to the outer case at No.4 vane and secure with four thumbscrews.
  - (b) Assemble the quill (Tool 357) through the mounting plate to locate in the LP driven bevel gear. Ensure that the thumbnut is clear of the mounting plate.
  - (c) Assemble the collet (Tool 358) to the bevel gear and quill, then carefully position the quill to engage with the dial gauge and tighten the collet.
  - (d) Screw the thumbnut to the mounting plate to load the gear bearings outboard.
  - (e) Assemble the LP bearing housing (1-270) to the inner case and retain with the clamp and slave spacer (Tool 250).

SUB-ASSEMBLY

OVERHAUL

- (4) Determine the backlash between the LP driver and LP driven bevel gears. Record the amount. Ensure that the backlash is within the limits quoted in F.C.S. 72-32-00/438.
- (5) After the completion of the check, remove the clock mounting plate collet and quill, and place the items in container (Tool 360). Remove the LP bearing housing from the inner case, then remove the bevel gear, adjusting washer and gauge. Place gauge in container.

B. Check Backlash of the HP Drive Bevel Gears (Ref.Fig.530).

- (1) Assemble the setting gauge (Tool 1813) to the HP bearing housing (2-80). Assemble the selected adjusting washer (72-61-00/1-50) (Ref.para.5.G.(2) and HP bevel gear (72-61-00/1-41) to the gauge, and retain with the special nut (Tool 960). Turn the case until the rear of the case is uppermost. Assemble the HP bearing housing to the inner case aligning the TOP of the bearing housing with the TOP of the case. Retain the items with a clamping plate (Tool 253), tightened sufficiently to take up the end-float of the gauge. Retain the housing (2-80) at the outer location with the slave spacer (Tool 251).
- (2) Assemble the adapter, quill and special nut to the case.
  - (a) Assemble the adapter (Tool 617) and bracket to the outer case at No.3 vane position and retain with bolts, washers and nuts.
  - (b) Assemble the quill (Tool 618) through the adapter and locate the special nut in the HP driven bevel gear.
  - (c) Position the quill to engage with the dial gauge, then tighten the wingnut to expand the quill in the gear.
  - (d) Unscrew the special nut (outboard of the adapter plate) to load the gear bearings outboard.

OVERHAUL

- (e) Determine the backlash between the HP bevel driver and the HP bevel driven gear. Record the amount. Check that the backlash is within plus 0.004 in. (0,10 mm) of the minimum backlash marked on the gear. If this is not achieved, then the procedures to determine the thickness of the adjusting washers for the HP driving gear, and the RH and LH driven gears (paragraphs 5G, 5H and 5J) are to be repeated as appropriate, and the backlash re-checked.
- (f) After completion of the check, remove the adapter, bracket and quill.
- (3) Assemble the adapter, quill and special nut to No.5 vane.
  - (a) Assemble the adapter (Tool 617) and bracket to the outer case at No.5 vane position and retain with bolts, washers and nuts.
  - (b) Assemble the quill (Tool 619) through the adapter and locate the special nut in the left-hand HP driven bevel gear.
  - (c) Position the quill to engage with the dial gauge, then tighten the wingnut to expand the quill in the gear.
  - (d) Unscrew the special nut to load the gear bearings outboard.
  - (e) Determine the backlash between the HP bevel driver and the HP bevel driven gear. Record the amount. Check that the backlash is within plus 0.004 in. (0,10 mm) of the minimum backlash marked on the gear. If this is not achieved, then the procedures to determine the thickness of the adjusting washers for the HP driving gear, and the RH and LH driven gears (paragraphs 5G, 5H and 5J) are to be repeated as appropriate, and the backlash re-checked.
- (4) After the completion of the check, remove the adapter, bracket and quill. Place the items in containers (Tools 631 and 270).
- (5) Remove the HP bearing housing from the inner case, then remove the bevel gear adjusting washer and gauge. Place the gauge in the container (Tool 270).

12. Assemble Left-hand and Right-hand Gearbox Mounting Brackets  
(Ref.S.B.72-97)

A. Assemble the Left-hand Gearbox Mounting Bracket (Ref.  
Fig.531).

- (1) Adjust the position of the intermediate case and stand until No.5 vane is uppermost.

CAUTION: WHEN ASSEMBLING A "SUPAGRAF" SEAL (72-120) TO THE STANDARD OF SB.OL. 593-72-9026-408, CARE MUST BE TAKEN WHEN HANDLING, AS THEY ARE SOFT AND EASILY DAMAGED. THEY MUST BE LUBRICATED WITH ENGINE OIL BEFORE ASSEMBLY AND MUST NEVER BE RE-USED.

- (2) Assemble 15 bolts (7-40) to the adapter plate (7-270) and retain in position with the retaining rings (7-30) using the assembly sleeve (Tool 1507). Lubricate the bolts with lubricant 'B'. Centralize the mounting bracket (7-310) to the adapter plate (7-270), then secure with eight bolts (7-260) lubricated with lubricant 'A'. Torque-tighten the bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m). Apply a light smear of jointing compound 'D' to the adapter plate (7-270) at the gland packing location, then assemble the adapter plate/mounting bracket assembly to the drive housing already assembled in No.5 vane. Assemble the seal (7-120), air seal ring (7-110) and adjusting ring (7-70) and secure with the air seal retainer (7-60).

OVERHAUL

- (3) Measure the gap which exists between the air seal retainer (7-60) and the adapter plate (7-270), and record as dimension B. Remove the air seal retainer and adjusting washer, then measure the thickness of the adjusting ring used for the check and record as dimension A.
  - (4) The thickness of the adjusting ring (7-70) required to produce a nip between 0.010 and 0.015 in. (0,254 and 0,381 mm) on the gland packing =  $A - B + 0.010/0.015$  in. (0,254/0,381 mm).
  - (5) Select the correct size adjusting ring (7-70) (72-09-21 Repair, Fig.409) from the range, then assemble it to the air seal ring (7-110). Reassemble the air seal retainer (7-60) and secure with the four bolts (7-50) lubricated with lubricant 'A'. Torque-tighten the bolts to 135 lbf in. (15,2 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).
  - (6) Measure the gap between the rear face of the front flange of the outer case and the mounting bracket to determine the required thickness of the adjusting washer (Ref.Fig.531). Select the correct size adjusting shim (7-180) (72-09-21 Repair, Fig.410), then assemble it to the case. Assemble the two hollow pins (7-250) through the front face of the intermediate case into the mounting bracket, with the threads of the pins facing outwards for extraction. Secure the mounting bracket and adjusting shim to the case with the slave plate (Tool 553), nuts and bolts. Torque-tighten the bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).
- NOTE:** If required, remove the hollow pins (7-250) using the mechanical puller (Tool 959).
- (7) Assemble blanks and protectors (Tools 576, 577 and 436).

SUB-ASSEMBLY

OVERHAUL

B. Assemble the Right-hand Gearbox Bracket Assembly (Ref.Fig.532).

- (1) Place the bracket assembly (8-220) on the worktop.
- (2) Measure dimension A and record.

CAUTION: WHEN ASSEMBLING A "SUPAGRAF" SEAL (8-100) TO THE STANDARD OF SB.0L. 593-72-9026-408, CARE MUST BE TAKEN WHEN HANDLING, AS THEY ARE SOFT AND EASILY DAMAGED. THEY MUST BE LUBRICATED WITH ENGINE OIL BEFORE ASSEMBLY AND MUST NEVER BE RE-USED.

- (3) Assemble the seal (8-100) to the bracket assembly then assemble the diaphragm (8-30).
- (4) Measure dimension B and record.
- (5) Measure dimension C and record.
- (6) The thickness of the adjusting plate (8-40) required to produce a nip on the seal (8-100) of between 0.007 in. and 0.010 in. (0,177 and 0,254 mm) =  $A - B - C - 0.007 \text{ in.} / 0.010 \text{ in.} (0,177 / 0,254 \text{ mm}).$
- (7) Turn the build stand until No.3 vane is uppermost.

CAUTION: WHEN ASSEMBLING A "SUPAGRAF" SEAL (8-100) TO THE STANDARD OF SB.0L. 593-72-9026-408, CARE MUST BE TAKEN WHEN HANDLING, AS THEY ARE SOFT AND EASILY DAMAGED. THEY MUST BE LUBRICATED WITH ENGINE OIL BEFORE ASSEMBLY AND MUST NEVER BE RE-USED.

- (8) Apply a light smear of engine oil to the gearbox bracket assembly (8-220) at the seal location, then assemble it to the HP drive housing already assembled in No.3 vane. Assemble the seal (8-100) to the bracket assembly and selected adjusting plate (8-40) (72-09-21 Repair, Fig.411). Retain with the diaphragm (8-30) and secure with six bolts (8-20) lubricated with lubricant 'A'. Torque-tighten the bolts to 135 lbf in. (15,2 N.m). Locking (run-down) torque 2.0 lbf in. (0,23 N.m).

- (9) Select by trial assembly the correct thickness (dimension D) adjusting plate (8-150) (72-09-21 Repair, Fig.412) from the range, then assemble it between the bracket assembly (8-220) and the rear face of the front flange of the intermediate case (Ref.Fig.532). Record the size of the selected adjusting plate.
- (10) Assemble a hollow pin (8-180) (Ref.S.B.72-8678-249) with the extraction threads facing outwards. Secure the items with a slave plate (Tool 1561), bolts (8-120), lubricated with lubricant 'A', and nuts (8-110) at the outer position, and bolts (8-130) at the inner position. Torque-tighten the bolts to 135 lbf in. (15,2 N.m). Locking (Run-down) torque 3.5 lbf in. (0,4 N.m).

NOTE: If required remove the hollow pin using the mechanical puller (Tool 959).

- (11) Assemble protectors and screwed plug (Tools 702, 569 and 436) to the bracket assembly.

### 13. Assemble Adapter, Splined Drive Shaft, Housing and Pressure Switches

#### A. Assemble Adapter Assembly to No.4 Vane (Ref.Fig.533).

- (1) Check that the seals (4-180) have a good bore roundness and finish, with an end gap of 0.002 in. (0,05 mm) when held tightly on the oil sump assembly (4-360) tube seal locations. If necessary, ream out the bores to ensure a good finish and the correct end gap.
- (2) Check that the 12 shank nuts (4-230) are correctly assembled to the adapter assembly (4-200) and that the adapter is free from damage. Apply a light smear of jointing compound 'D' to the adapter at the packing ring location, then align the adapter with the locating dowels already assembled to the outer position of the intermediate case at No.4 vane, and gently tap onto its abutment face. Lubricate 3 bolts (4-210) and one special bolt (4-220) with lubricant 'B' and secure the adapter to the case. Torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m). Wire-lock the bolts.

B. Assemble Gland Nuts and Packing (Ref.Fig.533).

CAUTION: WHEN ASSEMBLING A "SUPAGRAF" SEAL (72-120) TO THE STANDARD OF SB.OL.593-72-9026-408, CARE MUST BE TAKEN WHEN HANDLING, AS THEY ARE SOFT AND EASILY DAMAGED. THEY MUST BE LUBRICATED WITH ENGINE OIL BEFORE ASSEMBLY AND MUST NEVER BE RE-USED.

- (1) Assemble a seal (4-180) to each of the two tubes protruding through the adapter at No.4 vane, then assemble an air sealing ring (4-170) and another seal (4-180) to each tube and press the items into the adapter plate. Apply a light smear of jointing compound 'D' to the recessed diameters of two spacers (4-160), then assemble a spacer to each tube ensuring that the recessed diameter faces outboard.
- (2) With the items correctly assembled, lubricate two gland nuts (4-150) with lubricant 'A', then assemble a nut to each tube engaging them with the internal threads of the adapter. Screw down the two gland nuts by hand to nip the air sealing rings. Using wrench (Tool 1527) torque-tighten the two gland nuts (4-150) between 280 and 300 lbf in. (32,0 and 34,0 N.m), obtain a steady reading without movement of the nut. When this is achieved slacken off the gland nuts immediately, then torque-tighten each nut between 100 and 120 lbf in. (11,3 and 13,6 N.m).

NOTE: Prior to assembling the locking plate (4-140) it may be necessary to adjust the torque values of the gland nuts alternately, within the specified limits, to obviate malalignment of the locking tangs. If this is not possible torque-tighten to the next castellation.

- (3) Assemble a locking plate (4-140) so that the locking tangs locate both the gland nuts. Assemble two plain washers (4-130), then secure the locking plate with two bolts (4-120) lubricated with lubricant 'A'. Torque-tighten the bolts to 135 lbf in (15,2 N.m). Locking (Run-down) torque 3.5 lbf in. (0,4 N.m). Then wire-lock the bolts to each other.

Assembling the LP Pulse Probe Drive Shaft and Bearing  
Figure 534

**OLYMPUS 593**MK.610-14-28  
OVERHAUL

SNECMA

C. Assemble Pulse Probe Drive and Housing (Ref.Fig.534 and 535).

- (1) Prepare the bearing for assembly (Ref.72-09-00 Assembly).
- (2) Using driver (Tool 339) and support (Tool 337), assemble the ball bearing (72-64-00/1-70) to the splined shaft (72-64-00/1-80). Ensure that the self-locking feature of the retaining nut (72-64-00/1-50) is elliptical and not four lobed (Ref.S.B.72-105), then lubricate the nut with lubricant 'A' and screw it onto the shaft.
- (3) Retain the shaft with the holder (Tool 336), then check the locking torque of the nut, this should be between 4 and 35 lbf ft (5,4 and 47,4 N.m). Torque-tighten the nut between 40 and 50 lbf ft (54,2 and 67,8 N.m) then add the actual locking torque to the torque-tightening value.
- (4) Assemble the shearing quillshaft (72-64-00/1-40) (Ref.S.B.72-3) to the splined drive shaft (72-64-00/1-80), then secure the quillshaft with a retaining ring (72-64-00/1-30).
- (5) Using the mechanical driver (Tool 340) assemble the drive shaft and bearing assembly into the pulse probe drive housing (72-64-00/1-90), then secure the assembly with a retaining ring (72-64-00/1-60).
- (6) Place the gasket (72-64-00/1-140) over the drive shaft, then carefully insert the shaft into the upper aperture of the sump (nearest front flange of the intermediate case) at No.4 vane. Engage the splines of the shaft with those of the driven LP bevel gear, turning the gear slightly (if necessary) to effect engagement.
- (7) Align the gasket (72-64-00/1-140) with the bolt-holes, then press the housing onto its abutment face. Retain the housing with bolts (72-64-00/1-110 and 1-120) and nuts (72-64-00/1-100) lubricated with lubricant 'A'. Torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).

# D. Assemble LP Pulse Probe to Drive Housing (Ref.Fig.536).

NOTE 1: Before assembling the LP pulse probe, refer to SB.76-9 and SB.76-11.

NOTE 2: If for any reason the LP pulse probe is not assembled at this stage, assemble protector (Tool 570) to the drive housing location.

- (1) Remove the pulse probe (76-12-01/1-10) from its protective container, check that the probe is not damaged. Assemble the probe and Corruplus seal (76-12-01/1-40) to the uppermost face of the drive housing (72-64-00/1-90), then secure the probe with eight bolts (76-12-01/1-20) lubricated with lubricant 'A'. Torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).
- (2) Ensure that the gap between the pulse probe and the splines of the drive shaft is between 0.010 and 0.020 in. (0,254 and 0,508 mm).

NOTE: Before assembling the drive housing cover refer to S.B.72-41.

- (3) Assemble the drive housing cover (72-64-00/1-20) and gasket (72-64-00/1-25) to the drive housing and secure with seven bolts (72-64-00/1-10) lubricated with lubricant 'A'. Torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).

# E. Assemble the Oil Pressure Transmitter to Drive Housing (Sump Case) (Ref.Fig.536).

NOTE: If for any reason the oil pressure transmitter is not assembled at this stage, assemble protector (Tool 571) to the drive housing location.

- (1) Ensure that the transmitter flange face is clean and undamaged. Assemble two seals (79-33-01/1-70 and 79-33-01/1-80) to the oil pressure transmitter flange (79-33-01/1-10), then assemble the transmitter to the drive housing. Lubricate seven bolts (79-33-01/1-20) with lubricant 'A', then secure the transmitter with the bolts. Torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).

- F. Assemble the Oil Pressure Switch to Drive Housing  
(Ref.Fig.536).

NOTE: If for any reason the oil pressure switch is not assembled at this stage, assemble protector (Tool 572) to the drive housing location.

- (1) Ensure that the flange of the pressure switch (79-33-02/1-10) is clean and free from damage, then assemble two seals (79-33-02/1-70 and 79-33-02/1-80) to the switch flange. Lubricate seven bolts (79-33-02/1-20) with lubricant 'A', then secure the switch, together with a bracket. Torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).
- (2) Assemble the following protectors if not already assembled.
  - (a) Protector (Tool 574) to the bearing failure warning tube location and oil drain tube location.
  - (b) Protector (Tool 573) to the scavenge tube location.

#### 14. Assemble the Lubrication System (Ref.Fig.537 and 538)

##### A. Assemble Oil Jets and Tubes.

- (1) Remove protectors from the distributor (3-410) then check that all passages in the oil distributor (3-410) are unrestricted and that flanges are undamaged. Assemble an oil jet (3-140) to the distributor and secure with a bolt (3-130) and nut (3-120) lubricated with lubricant 'A'. Torque-tighten the bolt to 135 lbf in. (15,2 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).
- (2) Assemble a nozzle (4-50), if not already assembled, to its location in the oil feed housing (4-60).
- (3) Ensure that a sleeve (3-440) is in position in the distributor (3-410). Check that the oil feed tube (3-400) has freedom of movement in its location in the inner case, and that the tube has a reasonable sliding movement, then press the tube without force to the bottom of its well. Ensure that the cut-away in the feed tube faces the two delivery holes in the HP feed location.

##### B. Assemble Oil Distributor to No.2 Vane.

- (1) Carefully manipulate the oil distributor (3-410) to align the sleeve (3-440) and nozzle (4-50) in their respective locations in the oil feed housing (4-60) already assembled to the inner case.
- (2) Support the distributor, then pull the oil tube (3-400) up and press it into its location in the distributor. Apply lubricant 'A' to three bolts (3-420), then retain the distributor, do not tighten the bolts at this stage.
- (3) Secure the oil tube with a retaining plate (3-390) and bolt (3-380) lubricated with lubricant 'A'.

NOTE: It may be necessary to slacken the distributor securing bolts and adjust (by slight movement) either the oil feed tube or retaining plate to align the flat on the feed tube with the retaining plate.

SNECMA

OVERHAUL

- (4) Torque-tighten the three distributor securing bolts to 135 lbf in. (15,2 N.m). Torque-tighten the oil tube retaining plate bolt between 85 and 95 lbf in. (9,6 and 10,7 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).
- (5) Assemble the oil transfer tube (3-110) to its cross feed location in the distributor, then push the tube fully home to allow the oil distributor at No.6 vane to be assembled.
- (6) Assemble the oil transfer tube (3-370) to the LP bearing feed location in the distributor and secure with a retaining plate (3-360) and bolt (3-350) lubricated with lubricant 'A'. Torque-tighten the bolt to 135 lbf in. (15,2 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).

C. Assemble Oil Distributor to Inner Case.

- (1) Assemble the oil jet (3-30) to its location in the distributor (3-70), then retain the jet with a bolt (3-20) lubricated with lubricant 'A' and a nut (3-10).
- (2) Assemble the distributor (3-70) to its location in the inner case in line with No.6 vane. Retain the distributor at the top position with a bolt (3-60), the bottom right-hand position of the flange with a bolt (3-50) and bottom left-hand position on the flange with bolt (3-40). The three bolts to be lubricated with lubricant 'A'.

NOTE: The angular positions for the three bolts is relative to the intermediate case front flange being uppermost and the operator facing the distributor (3-70).

- (3) Torque-tighten the distributor (3-70) retaining bolts to 135 lbf in. (15,2 N.m), then torque-tighten the oil jet (3-30) retaining bolt (3-20) to 135 lbf in. (15,2 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).

SUB-ASSEMBLY

- (4) Withdraw the transfer tube (3-110) at the cross-feed position in No.2 vane distributor and slide the tube into its location in the distributor. Retain the transfer tube with a retaining plate (3-100), bolt (3-90) and nut (3-80) lubricated with lubricant 'A'. Torque-tighten the bolt to 135 lbf in. (15,2 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).
- (5) Assemble a blank (Tool 399) and seal to the LP bearing transfer feed tube.

#### 15. Assemble LP and HP Bearing Failure Probes to Oil Distributor

CAUTION: THE FRANGIBLE PROBES ARE SUSCEPTIBLE TO DAMAGE DURING THE SETTING PROCEDURE, AND IF KNOCKED WHILST BEING ASSEMBLED THEY SHOULD BE REMOVED AND SUBJECTED TO AN INSPECTION FOR CRACKING AND DISTORTION. IF A PROBE IS FOUND DAMAGED IT SHOULD BE REJECTED.

##### A. Assemble Adjusting Washers, Probes and Oil Distributor (Ref.Fig.538).

- (1) Select from the range of adjusting washers (3-180), two of the thinnest (0.110 in. (2,794 mm)), then assemble a probe (3-170), probe retainer (3-160) and the two selected adjusting washers to the LP location of the oil distributor (3-410). Temporarily retain the probe assembly with two bolts (3-150).

SUB-ASSEMBLY

72-32-00

Page 598.2

OLYMPUS 593

MK.610-14-28  
OVERHAUL

sneema

- (2) Assemble a probe (3-170) together with its retainer (3-160) and two 0.110 in. (2,794 mm) thick adjusting washers (3-180), to the HP location of the oil distributor (3-410). Temporarily retain the probe assembly with two bolts (3-150).
- (3) Assemble the transfer sleeve (3-440) to its location in the distributor (3-410), then assemble the distributor to No.2 vane position in the inner case. Temporarily retain the distributor with three bolts (3-420).

**B. Determine Thickness of LP Bearing Failure Probe Adjusting Washers (Ref.Fig.539).**

**NOTE:** To enable the thickness of the adjusting washers to be determined, a dimension 'G' from the LP Compressor Assembly/Module must be available. If the LP Compressor Assembly/Module or the dimension 'G' is not available, then para.B. cannot be carried out, and the correct washers cannot be determined and assembled. As a temporary measure, assemble the original adjusting washers, but attach a label stating that the washer thickness must be determined, and the correct washers assembled. This must be carried out prior to assembling the LP Compressor Assembly/Module to the Intermediate Case Assembly/Module in accordance with Assembly 72-00-00 Para.7.D.

- (1) Ensure the intermediate case is positioned front flange uppermost.
- (2) Locate the measuring fixture (Tool 21) on the front flange of the inner case, aligning the claw and probe.
- (3) Adjust the claw of the gauge so that it is in contact with the rear face of the LP probe and, the alignment arrows on the top face of the gauge point towards each other.
- (4) Using slip gauges measure the distance between the top of the gauge and the thumbnut and record as dimension 'B'.
- (5) Obtain dimension 'G' from the LP compressor section (72-31-00) build record sheets.

OVERHAUL

- (6) Using the following formula, calculate the required thickness of the LP probe adjusting washers (3-180) to produce the desired clearance between the probe and operating ring of between 0.024 and 0.029 in. (0,609 and 0,736 mm) for SB.72-21 standard, or between 0.020 and 0.025 in. (0,508 and 0,635 mm) for pre-SB.72-21 standard engines.

- (a) The required adjusting washer thickness =  
 $D + (\text{size of washer assembled for check}) +$   
 $(\text{desired clearance}) - G$

NOTE: D = 2.563 - dimension B.

- (7) Select two adjusting washers (3-180) that will produce a clearance between the probe and operating probe ring of between 0.024 and 0.029 in. (0,609 and 0,736 mm) for SB.72-21 standard, or between 0.020 and 0.025 in. (0,508 and 0,635 mm) for pre-SB.72-21 standard engines. Remove the gauge (Tool 21) and place it in container (Tool 263).
- (8) Remove the LP probe (3-170) and retainer (3-160) from the oil distributor, then remove the two adjusting washers used for the check.

CAUTION: THE FRANGIBLE PROBES ARE SUSCEPTIBLE TO DAMAGE DURING THE SETTING PROCEDURE, AND IF KNOCKED WHILST BEING ASSEMBLED THEY SHOULD BE REMOVED AND SUBJECTED TO AN INSPECTION FOR CRACKING AND DISTORTION. IF A PROBE IS FOUND DAMAGED IT SHOULD BE REJECTED.

- (9) Reassemble the probe retainer and the two selected adjusting washers (3-180) (72-09-21 Repair, Fig.407) to the distributor. Secure the probe with two bolts (3-150) lubricated with lubricant 'A'. Torque-tighten the bolts to 135 lbf in. (15,2 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).

OVERHAUL

C. Determine Thickness of HP Bearing Failure Probe Adjusting Washers (Ref.Fig.540).

- (1) Prepare the HP bearing (Ref.72-09-00 Assembly). Assemble the HP bearing (2-210) to the HP bearing housing (2-80), then locate the assembly on the fixture (Tool 826). Assemble the correct size adjusting washer (72-61-00/1-50) (Ref.para.5.G.(2)), bevel gear (72-61-00/1-41), operating probe ring/labyrinth assembly (72-61-00/1-30) to the fixture and secure the items to the fixture with the wingnut. Tighten the wingnut sufficiently to take up the bearing end-float.
- (2) Set the gauge (Tool 44) to the dimension from the operating probe ring rear land to the abutment face of the HP bearing housing and lock the gauge with the locking screw. With the setting gauge (Tool 44) locked securely, unscrew the bottom thumbscrew to release the gauge, then transfer the gauge to the inner case rear flange and secure with the thumbscrew. With the setting gauge correctly positioned, determine the dimension between the setting gauge and the rear face of the HP probe, record this as dimension K. The required adjusting washer size = Dimension K + (washer assembled for check) - between 0.022 and 0.027 in. (0,558 and 0,685 mm) for SB.72-29 standard, or between 0.020 and 0,025 in. (0,508 and 0,635 mm) for pre-SB.72-29 standard engine.
- (3) Remove gauge, do not disturb the setting. Remove the HP probe retainer, HP probe and the two adjusting washers assembled for the check, from the oil distributor.

CAUTION: THE FRANGIBLE PROBES ARE SUSCEPTIBLE TO DAMAGE DURING THE SETTING PROCEDURE, AND IF KNOCKED WHILST BEING ASSEMBLED THEY SHOULD BE REMOVED AND SUBJECTED TO AN INSPECTION FOR CRACKING AND DISTORTION. IF A PROBE IS FOUND DAMAGED IT SHOULD BE REJECTED.

- (4) Reassemble the HP probe, probe retainer and the two selected adjusting washers (3-180) (72-09-21 Repair, Fig.407) to the distributor. Lubricate two bolts (3-150) with lubricant 'A', then secure the probe assembly. Torque-tighten the bolts to 135 lbf in. (15,2 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m). Reassemble the gauge, then check the gap between probe and gauge to prove the desired 0.022/0.027 in. (0,558/ 0,685 mm) clearance for engines to SB.72-29 standard, or between 0.020 and 0.025 in. (0,508 and 0,635 mm) for engines to pre-SB.72-29 standard.
- (5) After completing the check, remove the gauge and place it in the container (Tool 825). Remove the oil distributor.
- (6) Assemble protectors to the following locations.
  - (a) Protector (Tool 433) to the oil filter location in the distributor.
  - (b) Protector (Tool 1814) to the LP bearing feed location in the distributor.
  - (c) Protector (Tool 1815) to the HP bearing feed location in the distributor.
  - (d) Protector (Tool 1816) to the oil jet location in the distributor.
  - (e) Protector (Tool 565) to the cross-feed location in the distributor, temporarily retain the protector with a retaining plate (3-100), bolt (3-90) and nut (3-80).
  - (f) Protectors (Tool 1817) to the oil distributor (3-70).

18. Pressure Test the Intermediate Case

A. Check the Oil Distributor and Oilways for Flow  
(Ref.Fig.544).

- (1) Turn the intermediate case until No.1 vane is uppermost.
- (2) Place a suitable container to collect drainage oil beneath the intermediate case.
- (3) Allow a quantity of clean lubricant A to enter the oil feed tube orifice at No.2 vane, then observe the emission of oil from the accessory gear oil feed jets, LP oil feed and the HP oil feed orifice.
- (4) After completion of the check, allow surplus oil to drain, then remove the container.
- (5) If the check is unsatisfactory and a blockage in the system is indicated then rectify the fault before proceeding further.

B. Assemble HP Bearing to Housing and Housing to Case.

- (1) Assemble the HP bevel gear (driver) (72-61-00/1-41) to the inner case, resting the gear on the two driven bevel gears, then assemble the previously calculated bevel gear adjusting washer (72-61-00/1-50).
- (2) Check that the air baffle (2-240) has been correctly assembled to the inner case, that the oil baffle (2-100) has been assembled to the HP bearing housing (2-80) and that the seal location is clean.
- (3) Install 'C' seal SB.0L593-72-9053-426 Standard. Assemble the 'C' seal (2-230) to the HP bearing housing abutment flange in the inner case.
- (4) Assemble the HP bearing housing to the inner case aligning the TOP position of the housing with the TOP of the case. Secure the bearing housing at its outer location with 18 bolts (2-220) lubricated with lubricant 'A'. Torque-tighten the bolts to 135 lbf in. (15,2 N.m). Locking (run-down torque 3.5 lbf in. (0,4 N.m).
- (5) Secure the housing at the mid location with the slave spacer and captive bolts (Tool 249).
- (6) Remove the HP thrust bearing (2-210) from its protective container then check that it has its full complement of ball bearings.

NOTE: The HP bearing is a single row race thrust bearing.

- (7) Ensure that the thrust arrows marked on the inside diameter of the inner tracks are aligned (Ref. Fig.545), then assemble the HP thrust bearing to the bearing housing with the arrows pointing forward. Assemble the oil thrower (2-120) and bearing retainer (2-110) to the bearing housing.

- (8) Install labyrinth housing to bearing housing SB.0L.593-72-9053-426 Standard. Assemble the 'C' seal (2-70) and inner labyrinth housing (2-60) to the bearing housing. Apply locking compound 'C' under the heads of the bolts (2-50) and apply lubricant 'A' to the threads, then secure the items. Torque-tighten the bolts in correct sequence (Ref.72-09-00) to 135 lbf in. (15,2 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).

C. Assemble the LP Bearing Assembly.

NOTE: The LP thrust bearing is a double row race. Prior to assembly ensure that the thrust arrows on the inside diameter of the inner tracks are correlated and point forward (Ref.Fig.514).

- (1) Using the stand handle turn the intermediate case until the front flange is uppermost.
- (2) Assemble the oil thrower (1-200) to the bearing housing (1-270), then assemble the LP bearing (1-190) with the thrust arrows pointing forward. Assemble the LP bearing retainer (1-170) to the bearing housing, then secure with bolts (1-160) lubricated with lubricant 'A'. Torque-tighten the bolts to 135 lbf in. (15,2 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).
- (3) Assemble four pressure blanks (Tool 1915) and two pressure blanks (Tool 1916) and six gaskets to the static seal locations in the inner case. Refer to Fig.547 for assembly detail.
- (4) Check that the LP oil transfer tube outer (3-370) is in position in the oil distributor at No.2 vane and the LP oil transfer tube inner (3-340) is in position in the LP bearing housing.

OVERHAUL

- (5) Install 'C' seal SB.0L593-72-9053-426 Standard. Assemble the 'C' seal (1-320) to the inner case. Do not use jointing compound.

NOTE: For the purposes of pressure testing only, a seal that has already been used may be fitted.

- (6) Assemble the LP bearing housing (1-270) to the inner case aligning the TOP symbols with the TOP of the case. Secure the housing to the inner case with a spacer ring (Tool 252) and slave bolts, and at the outer position with a slave spacer (Tool 250) and slave bolts.
- (7) Ensure that the seals are in position in the two clamp ends of the pressure test equipment (Tool 1820), then assemble the equipment to the LP and HP bearing housing assemblies, engaging the threads of the long bolt in the clamp end assembled to the LP housing. Tighten sufficiently to form an effective seal but do not overtighten. Assemble a blank (Tool 616) to the LP side of seal plate.

D. Assemble Pressure Test Equipment to the Outer Case.

- (1) Assemble an inlet feed adapter (Tool 1819) to the oil feed tube (4-60) at No.2 vane, then assemble a blank (Tool 441) to the bearing failure warning tube (4-100).
- (2) Assemble blank to gearbox mounting bracket.
  - (a) On engines to pre SB.72-8689-272 standard, assemble blank (Tool 439) and lockring (Tool 690) to the mounting bracket at vane No.3.
  - (b) On engines to SB.72-8689-272 standard, ensure that a serviceable seal is installed on the blank (Tool 3123) then assemble the blank to the mounting bracket at vane No.3 and secure it with the 18 bolts, flat washers and nuts.

# OLYMPUS 593

MK.610-14-28

sneema

OVERHAUL

Printed in England

(c) Assemble adapter (Tool 442) to the air pressurizing connector.

- (3) Assemble a gasket (8-210) and blank cover (8-200) to the right-hand gearbox mounting bracket (No.3 vane) then retain the blank cover and gasket with three bolts (8-190) lubricated with lubricant 'A'. Torque-tighten the bolts to 135 lbf in. (15,2 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).
- (4) Assemble a blank (Tool 689) to the bearing failure warning tube location at No.4 vane (LP pulse probe drive housing flange). Assemble a blank (Tool 1821) to the oil scavenge tube location at No.4 vane. Assemble a blank (Tool 815) to the LP pulse probe drive housing flange (72-64-00/1-90), if the drain tube from the right-hand gearbox adapter, pressure switch and transmitter have not been assembled. If the LP probe is not in position (No.4 vane) then assemble a blank (Tool 816).
- (5) Assemble a blank (Tool 892) to the left-hand gearbox adapter location at No.5 vane.

E. Connect Mobile Oil Rig to Intermediate Case (Ref.Fig.546).

**WARNING:** A HIGH OIL TEMPERATURE WILL BE MAINTAINED DURING PRESSURE TEST, SAFETY PRECAUTIONS MUST BE STRICTLY OBSERVED AT ALL TIMES.

- (1) Position the mobile pressure test rig (Tool 1926) at a convenient point near the intermediate case.
- (2) Position the protection screens (Tool 829) around the oil rig and intermediate case.
- (3) Withdraw the dipstick from the rig and check the oil level, if necessary top up the rig to the required level with lubricant 'A'.
- (4) Ensure that the circulating pump motor switch and the oil heater switch, at the rear of the rig, are both in the 'OFF' position.
- (5) Connect the oil feed line from the rig to the oil inlet adapter (Tool 1819) at vane 2 of the intermediate case.

SUB-ASSEMBLY

- (6) Connect the rig test return line to the No.4 vane scavenge location of the intermediate case. Using the stand handle turn the intermediate case until No.4 vane is uppermost.
- (7) Remove the electrical cable from the oil test rig then plug it into the shop supply (30 amp 600 volt). Refer to the manufacturers recommendations for general information about the oil rig.

F. Check Connectors and Pressure Blanks (Ref.Fig.546).

NOTE : This is a preliminary check to ensure that the oil test rig functions correctly and that pressure blanks and adapters assembled to the intermediate case do not leak oil.

- (1) Ensure that the oil pressure control on the supply rig is closed.
- (2) Switch on the shop electricity supply.
- (3) Switch on the circulating pump motor.
- (4) Regulate the oil pressure control on the supply rig to deliver oil at 10 psig (69 kPa) measured on the gauge in the line at No.2 vane.
- (5) Allow the circulating pump motor to run long enough to prime the intermediate case with oil and to expel air.
- (6) Check all screwed connections, blanks and adapters on the intermediate case for leaks. If a leak occurs at any of these points switch off the circulating pump, investigate the nature of the leak and rectify as necessary.
- (7) If the check is satisfactory switch off the circulating pump motor.

- (d) On completion of checks and /or rectification, re-assemble the HP turbine assembly to the HP compressor (Ref.para.5.), then re-balance the complete assembly (Ref.para.6.).
- (6) Readings within the limits.
- (a) The following procedures are those required to balance the assembly at F and T3 to within 6 drn in.
- NOTE: Apply lubricant 'A' to bolt threads before assembly of nuts.
- (b) Reduce unbalance by adding at T3 balancing weights (72-51-04/1-200) maximum of 8 off (72-51-04/1-205, 210, 215) maximum of 4 off each and (72-51-04/1-220) maximum of 8 off, retained by self-locking nuts (72-51-04/1-190) maximum of 10 off. Ensure the nuts have a minimum locking (run-down) torque of 6.5 lbf in. (0,73 N.m) torque-tighten to 210 lbf in. (24 N.m).
- NOTE: Self-locking nuts are not to be fitted without balancing weights.
- (c) Reduce unbalance by adding at U balancing weights (02/3-140) use a maximum of 3 off each for all the weights provided and retain each weight with self-locking nuts (02/3-130) and bolts (02/3-170) use a maximum of 5 off each. Ensure the nuts have a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m) torque-tighten to 100 lbf in. (11,5 N.m).
- (d) Record the angular position and weights used at T3 and U.

D. Remove the HP Compressor and Turbine Assembly from the Balancing Machine.

- (1) Remove the top half of the guard (if fitted) from around the turbine disk, then assemble the split sleeves (Tool 393) to the LP drive shaft and HP turbine rear labyrinth. Release and hinge open the bridge piece of the adjustable support.

(9) With the oil temperature steady at  $120 \pm 50^{\circ}\text{C}$  adjust the scavenge outlet pressure to produce a 4 psig (27.5 kPa) reading on the pressure gauge at No.4 vane (Ref.Fig.548).

(10) Flow for 15 minutes checking for leaks continuously (Ref.Fig.549).

NOTE: During testing, the gland seals at No.3, 4 and 5 vane positions will be unpressurized. These are pressurized and tested in para.1 and leaks from them may be ignored at this stage.

(11) Readjust the scavenge outlet pressure on the rig to produce a 10 psig (69 kPa) on the scavenge outlet pressure gauge at No.4 vane.

(12) Flow for a further 15 minutes checking for leaks continuously (Ref.Fig.549).

(13) If leakage occurs from the six vent plugs or the twelve segment retaining bolts, it will be necessary to remove the inner case assembly (5-330 and 5-420). The vent plugs can then be removed, cleaned and replaced. To remove the bolts, the inner case must be disassembled. For assembly procedure, refer to Para.2.

#### H. Differential Oil Pressure Flow Check (Ref.Fig.550).

NOTE: A differential oil pressure of 30 psig (207 kPa) is to be measured between the inlet and outlet pressure gauges assembled to the adapters on No.2 and 4 vanes. For example, a regulated delivery pressure of 50 psig (345 kPa) measured on the gauge at No.2 vane should produce 20 psig (138 kPa) measured on the gauge at No.4 vane. The differential oil pressure would then be 30 psig (207 kPa).

(1) Fully open the scavenge line at the supply rig leaving the return oil from No.4 vane completely unrestricted.

(2) Adjust the oil delivery pressure control regulator on the supply rig to obtain the differential oil pressure of 30 psig (207 kPa) measured between the inlet and outlet pressure gauges on the intermediate case.

- (3) Observe that the oil temperature is steady at  $120 \pm 5^{\circ}\text{C}$  and that the 30 psig (207 kPa) differential oil pressure measured between the inlet and outlet gauges on the intermediate is steady.
- (4) Remove the flowmeter indicator from its protective container.
- (5) Ensure that the flowmeter indicator is of the type (BE 71N 1300320, SN 333/73).
- (6) Ensure that the flowmeter indicator has been calibrated correctly to indicate on the scale the required flow, between 240 and 260 gallons per hour.
- (7) Position the flowmeter indicator on a flat surface at a convenient point near the supply rig.
- (8) Plug in the flowmeter indicator electrical leads to the rear of the rig.
- (9) Switch on the flowmeter indicator.
- (10) Record the gallons per hour shown on the flowmeter indicator.

NOTE: If the metered oil flow is not within limits this may indicate an internal oil leak, or that the flow through the jets feeding the LP and HP bearings, bevel gears etc., is not within limits. An internal oil leak would eventually be observed draining from the drain tube at No.4 vane.

- (11) If the check is unsatisfactory and all reasoning for superficial defects exhausted, then prepare to disassemble the intermediate case as far as is deemed necessary, employing the process of elimination to investigate and detect the fault.
  - (12) Press the circulating pump motor STOP button.
  - (13) Switch off the electrical supply.
  - (14) Wearing protective clothing disconnect the supply and return lines to the intermediate case.
  - (15) Allow the intermediate case to cool then drain the oil.
  - (16) Disassemble the intermediate case to check the seal of internal pressure blanks.
  - (17) Visually check the sealing grooves and sealing faces for the 'C' seals. Ensure there is a satisfactory sealing witness mark. If necessary, refer to Para. 2.G. for surface finish details.
  - (18) Check the oil distributor, feed tubes and jets for faults.
  - (19) Use new 'C' seals and reassemble the intermediate case and repeat the oil pressure checks until satisfactory results are achieved.
- J. Check the LP and HP Bearing Failure Oil Warning System (Ref.Fig.551).
- (1) Disconnect and remove the gauge from No.2 vane.
  - (2) Reconnect the oil delivery line to No.2 vane.
  - (3) Assemble the pressure test rig (Tool 1917) to the front face of the intermediate case and secure to the flange with thumbnut and to No.1 vane with the retainer and thumbnut.

- (4) Remove the pressure blank from the bearing failure warning tube at No.2 vane then assemble the short flexible tube from the small rig to the bearing failure warning location.
- (5) Assemble the small diameter tube from the small rig to the oil feed adapter at No.2 vane.
- (6) Connect a flexible hose to the outlet connection on the small rig.

NOTE: The oil flow from this hose must be an unrestricted return to the supply rig or directed into an enclosed container.

- (7) Ensure that the pressure control regulator is closed.
- (8) Open the scavenge line.
- (9) Switch on the electrical supply to the oil supply rig.
- (10) Switch on the oil heater to the rear of the rig.
- (11) Allow the oil to heat to  $120 \pm 5^{\circ}\text{C}$ .
- (12) Close the bearing failure warning oil control valve.
- (13) Press the circulating pump motor START button.
- (14) Open the oil delivery line on the rig.
- (15) Regulate the pressure control to deliver oil at 10 psig (69 kPA) measured on the LP and HP bearing oil pressure gauge on the small rig attached to the intermediate case.
- (16) Observe the oil pressure measured on the bearing failure warning pressure gauge, this should be within 2 psig (14 kPA) of the oil inlet pressure measured on the LP/HP bearing pressure gauge.

SUB-ASSEMBLY

OVERHAUL

- (17) Open the valve on the small rig, this will direct warning oil back to the supply rig.

NOTE: The bearing failure warning pressure gauge should now read zero, the oil inlet pressure will probably drop and there should be a substantial flow of warning oil directed back to the supply rig.

- (18) Observe the warning oil returning to the supply rig through the flow indicator on the small test rig.

NOTE: If there is no flow of warning oil back to the rig, a blockage somewhere in the bearing failure warning system is indicated.

- (19) If the test is unsatisfactory, press the circulating pump motor STOP button then switch off the electrical supply to the rig.

- (20) Allow the intermediate case to cool then drain all the oil.

- (21) Disconnect the rigs from the intermediate case then remove the seal plates.

- (22) Disassemble the intermediate case only as far as is necessary to investigate the fault and rectify.

NOTE: It will not be necessary to remove the HP bearing housing assembly.

- (23) Rebuild the intermediate case observing the correct torque-tightening values.

- (24) Reconnect the two pressure test rigs, fill the intermediate case with oil and repeat the relevant test procedure under para.J.

- (25) If the test is satisfactory, press the circulating pump motor STOP button then switch off the heater. Disconnect and release the small rig from the intermediate case.

K. Assemble Fluid Passage Bolts, Multiple Connectors, Adapter and Tubes (Ref.Fig.552).

- (1) Apply lubricant 'A' to a fluid passage bolt (75-05-02/1-160) then assemble it with a flat washer (75-05-02/1-150) to the adapter at No.3 vane. Torque-tighten the bolt between 120 and 140 lbf in. (13,6 and 15,8 N.m).
- (2) Assemble a multiple connector (75-05-02/1-170) to the fluid passage bolt then retain the connector with a capnut (75-05-02/1-140) lubricated with lubricant 'A'. Do not tighten at this stage.
- (3) Apply lubricant 'A' to a fluid passage bolt (75-05-02/1-300) then assemble it with a flat washer (75-05-02/1-290) to the housing at No.4 vane. Torque-tighten the bolt between 120 and 140 lbf in. (13,6 and 15,8 N.m).
- (4) Assemble a multiple connector (75-05-02/1-310) to the fluid passage bolt, then retain the connector with a capnut (75-05-02/1-280) lubricated with lubricant 'A'. Do not tighten at this stage.
- (5) Apply lubricant 'A' to adapter (75-05-02/1-420) then assemble it with a flat washer (75-05-02/1-430) to the adapter at No.5 vane. Torque-tighten the bolt between 120 and 140 lbf in. (13,6 and 15,8 N.m).
- (6) Apply lubricant 'A' to the threads of the multiple connectors at No.3 and 4 vanes then assemble a tube (75-05-02/1-250) to the connectors.

NOTE: The run of this tube extends forward of the front flange of the intermediate case.

- (7) Apply lubricant 'A' to the threads of the adapter at No.5 vane then assemble the tube (75-05-02/1-390) to the connector at No.4 vane and adapter at No.5 vane.

NOTE: With the capnuts still loose the multiple connectors may be moved slightly, if necessary, so that the air tubes take up their correct positions without being stressed.

- (8) Torque-tighten the capnuts at No.3 and 4 vanes between 120 and 140 lbf in. (13,6 and 15,8 N.m).
- (9) Torque-tighten the unions securing the tube between No.3 and 4 vanes between 90 and 100 lbf in. (10,2 and 11,3 N.m).
- (10) Torque-tighten the unions securing the tube between No.4 and 5 vanes between 90 and 100 lbf in. (10,2 and 11,3 N.m).

L. Carry Out Gland Seal Leak Check (Ref.Fig.553 and 554).

NOTE: This check is carried out whilst the intermediate case is still hot at  $120 \pm 5^{\circ}\text{C}$ .

- (1) Disconnect the scavenge line from the adapter at No.4 vane.
- (2) Connect a flexible hose to the adapter at No.4 vane then connect the other end of the hose to the supply rig.
- (3) Close the delivery line on the supply rig.
- (4) Open the valve in the return line at the side of the rig.
- (5) Press the circulating pump motor START button.

- (6) Press the circulating pump motor STOP button when the oil in the intermediate case falls to the level of the vent in the seal plate.
  - (7) Close the drain valve in the return line at the side of the rig.
  - (8) Ensure that the entries to No.3 and 5 vanes, which carry the main drives, are fully submerged.
  - (9) Remove the pressure blank (Tool 616) from the LP side of the seal plate (Ref.Fig.547 and 553), then assemble a relief valve (Tool 595) to this position.
  - (10) Remove a capnut from the air pressure connector at No.4 vane then assemble the adapter and gauge (Tool 596) to this position.
  - (11) Assemble the air pressure test rig (Tool 584) to the arm of the build stand and secure.
  - (12) Connect the flexible hose (marked vane 3) from the air pressure test rig to the adapter at No.3 vane.
  - (13) Connect the flexible hose (marked vane 2) from the air pressure test rig to the adapter at No.2 vane.
  - (14) Connect the shop air supply to the air pressure test rig.
  - (15) Adjust the relief valve (assembled to the seal plate) to open at 10 psig (69 kPA).
- NOTE: The oil level must be below the relief valve.
- (16) Ensure that the pressure regulators on the air pressure test rig are closed.

OVERHAUL

- (17) Open the shop delivery air line gradually then regulate the air at the air pressure rig so that the air space above the oil is pressurized to 10 psig (69 kPa).

NOTE: Under this condition, with the gland seals unpressurized, oil leakage past the gland seals can be observed.

- (18) Record on the engine record sheets if no leakage past the seals occurs.
- (19) Close the air supply to No.2 vane, then carefully slacken the inlet connector at No.2 vane to depressurize the oil chamber. Retighten the connector.
- (20) Open the air supply to No.2 vane.
- (21) Apply approximately 15 psig (103 kPa) air pressure to the gland seals, then raise the oil chamber pressure again to 10 psig (69 kPa).
- (22) Regulate the various air pressures until conditions are steady, with the oil chamber pressure at 10 psig (69 kPa) and the gland seal pressurizing air between 2 and 5 psig (between 14 and 35 kPa) above the oil chamber air pressure.
- (23) Check that under these conditions, oil leakage from the pressurized gland seals ceases completely.
- (24) If the leak does not cease, check the air system for blockages and repeat the check.
- (25) If after repeating the check, the gland seals still leak oil turn off the air supply.
- (26) Drain all the oil from the intermediate case.

- (27) Remove the suspect seals from the relevant vane ends, refer 72-32-00 Disassembly.
- (28) Examine the seals for fit and damage.
- (29) Reassemble new seals as required, refer to Sub-Assembly para.12.A, B and para.13.A, B and C.
- (30) Half fill the intermediate case with oil and repeat the pressurized gland seal check as detailed in para.L.

#### 19. Finalize the Intermediate Case for Engine Build

##### A. Drain Oil From the Intermediate Case.

- (1) Ensure that the flexible hose from No.4 vane is connected to the drain connector in the side of the rig.
- (2) Open the drain valve positioned to the side of the rig.
- (3) Press the motor START button and drain oil from the intermediate case.
- (4) Press the motor STOP button, close the drain valve and disconnect the hose from the side of the rig.
- (5) Switch off the electrical switches to the rear of the rig, then switch off the main electrical supply to the rig.
- (6) Stow the feed and scavenge flexible hoses in the top of the rig. Coil and stow the main electrical cable.

CAUTION: DO NOT REMOVE PRESSURE TEST EQUIPMENT FROM THE INTERMEDIATE CASE UNTIL COOL.

OLYMPUS 593

MK.610-14-28

OVERHAUL

NOTE: A residue of oil still remains in No.3 and 5 vanes.

- (7) Place a suitable container beneath the intermediate case.
- (8) Ensure the case is cool then release the lockscrew on the build plate and turn the case until No.3 vane is at the bottom.
- (9) Remove the pressure blank from the end of the vane and allow the oil to drain into the container.
- (10) Turn the case until No.5 vane is at the bottom, then remove the pressure blank and allow the oil to drain into the container.

B. Remove Pressure Test Equipment.

- (1) Remove the adapter and pressure gauge from No.2 vane then remove the pressure blank from the bearing failure warning tube at No.2 vane.
- (2) Remove the adapter and pressure gauge from No.4 vane.
- (3) Remove the air relief valve from the seal plate.
- (4) Unscrew the seal plate retaining nut, then release both the seal plates from the centre of the intermediate case.

C. Final Assembly of HP Air Baffles.

- (1) Using the stand handle turn the intermediate case until the rear flange is uppermost.
- (2) Remove the slave spacer (Tool 249) from the HP bearing housing.
- (3) Identify the TOP position of the inner rear baffle (2-40) then assemble it to the bearing housing locating the baffle on the rear of the inner housing (2-60). Ensure the bolt-holes in the baffle (2-40) align with the bolt-holes in the bearing housing (2-80).
- (4) Observe the TOP position of the outer rear baffle (2-30) then assemble the baffle locating the cutaways of the baffle and dogs of the inner housing (2-60). Using a suitable driver and mallet tap the baffle into its locked position, ensure that all TOP markings correlate.
- (5) Assemble the air baffle (2-20) to its correct position (observe the TOP) to the rear outer baffle and inner case.
- (6) Apply lubricant 'A' to the threads of 24 bolts (5-310) then assemble the bolts to the outer location of the air baffle (2-20). Do not tighten.
- (7) Apply lubricant 'A' to the threads of 12 bolts (2-10) then secure the inner and outer baffle and the air baffle (2-20) at the mid position. Torque-tighten the bolts (5-310) and (2-10) in their correct sequence (Ref.72-09-00) to 135 lbf in. (15,2 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).

D. Prepare the LP Bearing Housing and Air Baffles for Engine Build.

- (1) Place the LP bearing housing assembly (1-270) front face down on the worktop.
- (2) Check that the oil thrower (1-200) is in position (resting on the inner labyrinth seal).
- (3) Check that the LP bearing (1-190) has been assembled correctly to the bearing housing with the thrust arrows on the inner tracks correlated and pointing forward.
- (4) Check that bearing retainer (1-170) is seating properly and the retaining bolts (1-160) torque-tightened to 135 lbf in. (15,2 N.m). Locking (run-down) torque 3.5 lbf in. (0,4 N.m).
- (5) Ensure the transfer tube inner (3-340) is in position in the LP bearing housing and retained with the plate (3-330) and bolt (3-320).
- (6) Turn the LP bearing housing assembly front face uppermost.
- (7) Identify the TOP positions of the front inner baffle (1-340) and outer housing (1-350) and the LP bearing housing.
- (8) Assemble the front inner baffle (1-340) to the LP bearing housing, locating the baffle on the inner labyrinth housing (1-330) already assembled to the LP bearing housing.
- (9) Align the outer housing (1-350) with the dogs of the inner labyrinth housing, then assemble the outer housing.

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (10) Using a suitable driver and mallet tap the outer housing (1-350) into its locked position. Ensure that all TOP markings correlate.
- (11) Temporarily assemble 30 bolts (1-20) to the inner location.
- (12) Place 24 bolts (1-10) in a canvas bag, then attach the bag to the bearing housing. Place the bearing housing assembly in a container (Tool 1231).
- (13) Place the LP bevel gear (1-40) and its calculated adjusting washer (1-50) in the container with the LP bearing assembly.
- (14) Store the container with the bearing assembly and loose items on a pallet, mark the container with the engine number, then transfer the LP bearing housing assembly with any relevant documentation to the engine build area.

E. Assemble Static Labyrinth Ring to Static Housing Seal Ring Assembly.

- (1) Ensure that the abutment faces of the static labyrinth ring (5-30) and the static housing seal ring assembly (5-40) are clean and free from damage, lightly stone if necessary.

NOTE: Prior to the following operation ensure that that static seal ring assembly is to the standard of SB.72-8853-322.

- (2) Place the static housing seal ring assembly on the worktop, resting on its six legs. Identify the single (unpaired) hole in the inner flange (TOP), then identify the corresponding hole (TOP) in the static labyrinth ring and position the ring (5-30) on the housing assembly (5-40).
- (3) Secure the labyrinth ring (5-30) to the housing assembly (5-40) with 11 bolts (5-20), lubricant 'A' applied, and nuts (5-10). Ensure that the boltheads face forward (towards the housing legs).
- (4) Torque-tighten the 11 bolts between 36 and 40 lbf in. (4,1 and 4,5 N.m). Locking (run-down) torque 2.0 lbf in. (0,23 N.m).

OLYMPUS 593

MK.610-14-28

OVERHAUL

sneema

- (5) Ensure that the 12 hollow locating pins (5-70) have been assembled to the static seal housing (5-40) (Ref. 2.M.(1)(p) then label the seal housing with the correct engine No., and place the housing in a protective container.

F. Assemble Protectors to the Intermediate Case.

- (1) Assemble a protector (Tool 232) to the turbo pump air feed duct.
- (2) Assemble a protector (Tool 578) to the air feed pressure elbow.
- (3) Assemble a protector (Tool 564) to the HP rear outer air baffle.
- (4) Assemble a protector (Tool 565) to the oil distributor at No.2 vane, oil transfer tube location.
- (5) Assemble a protector (Tool 566) to the oil distributor transfer tube location at No.6 vane.
- (6) Assemble a protector (Tool 568) to the oil feed tube at No.2 vane.
- (7) Assemble a protector (Tool 1365) to the bearing failure warning tube No.2 vane.
- (8) Assemble protector to the gearbox adapter plate at No.3 vane.
  - (a) On engines to pre SB.72-8689-272 standard, assemble protector (Tool 702) to the adapter plate.
  - (b) On engines to SB.72-8689-272 standard, assemble protector (Tool 3124) to the adapter plate.
- (9) Assemble screwed plugs (Tool 436) to the air tube location at No.3 and 5 vanes if air supply tubes have not been assembled.
- (10) If the LP pulse probe is not assembled then assemble a protector (Tool 570) to the sump position at No.4 vane.

SUB-ASSEMBLY

**72-32-00**

PRINTED IN ENGLAND

- (11) Assemble a protector (Tool 571) to No.4 vane at the oil pressure transmitter location face, if the transmitter has not been assembled.
- (12) If the oil pressure switch has not been assembled then assemble a protector (Tool 572) to its location on the oil sump.
- (13) Assemble a protector (Tool 574) to the bearing failure warning tube location at No.4 vane (sump).
- (14) Assemble a protector (Tool 573) to the scavenge tube location at No.4 vane.
- (15) Assemble a protector (Tool 574) to the oil drain tube location at No.4 vane.
- (16) Assemble a protector (Tool 1927) to the vent chamber oil drain tube at No.4 vane.
- (17) Assemble a protector (Tool 576) and pillar nut (Tool 577) to the gearbox adapter at No.5 vane.
- (18) Assemble a protector (Tool 568) to the air tube at No.6 vane.
- (19) Check that all loose items are suitably identified and if necessary placed in protective containers.
- (20) Ensure that loose shims and adjusting washers have been clearly identified.

G. Remove Intermediate Case from Build Stand.

- (1) Position the case front flange uppermost in the build stand.
- (2) Assemble the multiple leg sling (Tool 1089) to the front flange, then connect the overhead hoist to the sling.

OLYMPUS 593

MK.610-14-28

sneema

OVERHAUL

- (3) Release the intermediate case from the build stand and place the slave nuts and washers in a container.
- (4) Raise the hoist, then secure three (equally spaced) transport blocks (Tool 1232) to the rear outer case flange with slave washers and nuts. Lower the intermediate case onto a pallet, then disconnect the hoist and remove the sling.
- (5) Assemble a protector (Tool 563) to the intermediate case front flange.
- (6) Pass the intermediate case assembly and loose items complete with the relevant record documents to the HP compressor assembly section.
- (7) If S.B.72-21, 29, 91 and 93 have been incorporated, module interchangeability will be affected. Check to ensure that the module identification plate is in accordance with the interchangeability chart.

## CONCORDE

### OLYMPUS 593 OVERHAUL MANUAL

TEMPORARY REVISION No. 72-518  
Insert in 72-33-00 before page 501

#### REASON FOR ISSUE:

The current Overhaul Manual does not give sufficient information on build requirements of H.P. compressor stator vanes in relation to the part number of the compressor case involved. (MRA 75).

#### ACTION

Add the following NOTE after 1.B. General.

NOTE: The current instructions with respect to the build of the H.P. compressor stator vanes make no reference to the part number of the compressor cases in which they are to be built, and this is important for configuration reasons. Therefore, at build, refer to the I.P.C. for the appropriate stage to ensure that the intended combination of vane/case is acceptable.

OLYMPUS 593

OVERHAUL

SEE TR

HP COMPRESSOR ASSEMBLY - SUB-ASSEMBLY

1. General

- A. Prior to commencing the sub-assembly, refer to 72-09-00 Assembly for general information.
- B. During the sub-assembly procedure, reference will be made to the Illustrated Parts Catalogue (I.P.C.) to identify those items where the nomenclature does not positively identify them, due to the duplication of the title e.g., nuts, bolts, washers, vanes, spacer, disks etc. An item will be identified as bolt (1-10), the 1 referring to the I.P.C. Fig.No., and the 10 referring to the Item No. To distinguish between the HP compressor case items which are under breakdown 72-33-01, and the HP rotor items which are under 72-33-02, the case items will be identified by their Fig. and Item No. only, but the rotor items will be prefixed 02/ before their Fig. and Item No. e.g. (02/1-10). Where items from any other breakdown are introduced, the full breakdown numbers will be quoted e.g. bolt (72-51-03/1-90).
- C. Throughout the text special tools are quoted by their Ref. No. e.g. (Tool 1234). For a complete list of tooling required for the assembly and balance, and for the Manufacturers Part No., refer to Special Tools, Fixtures and Equipment Tables 1004 to 1007. Where special tools are quoted in the assembly for storage and protection of the rotor blades, disks, etc., suitable alternative containers and protectors may be used.
- D. This chapter details the work necessary for preparing the HP compressor assembly ready for engine final build. The assembly comprises the HP compressor case and vanes, and the HP compressor rotor, but in addition, the LP compressor drive shaft must be assembled at the initial stage of the assembly. On engines to pre SB.72-8305-154 Part 2 standard the HP compressor assembly is dynamically balanced in conjunction with the HP turbine rotor (72-51-03) and hub and labyrinth assemblies (72-51-04). On engines or modules overhauled (or repaired) with the tooling introduced by SB.72-8305-154 Part 2 standard, the HP compressor assembly can be dynamically balanced using a HP turbine simulator, providing that the HP turbine hub and labyrinths are the original, or are statically balanced with either a balanced bladed HP turbine rotor, or a slave turbine rotor (Ref. 72-51-03, para.9 onwards). On completion of the balancing the intermediate case is assembled to the compressor assembly prior to its despatch to engine build.
- E. The HP compressor case and vanes will be received from 72-33-01 Assembly, with the exit guide vanes and blanks assembled to the rear case, and the stage 5 vanes and blanks assembled to the front case. In addition the

OVERHAUL

stage 1 and 2 stator vane inner fixing ring assemblies will be assembled.

- F. The HP compressor rotor will be received from 72-33-02 Assembly ready for assembly into the HP front and rear cases. The blades will have been mass moment weighed, the bladed compressor disks and spacers balanced, the blades numbered, assembled and locked (as appropriate), and the datum points marked. Prior to the assembly of the bladed compressor disks to the casings, the No.1 datum blade of each stage may be painted to assist identification of blade positions when internal examinations of the HP compressor are carried out during the operation of the engine. Refer to Standard Practices 72-09-00 Assembly.
- G. The LP drive shaft will be received from 72-31-04 Assembly having been assembled, balanced and the signal system checks carried out, and the HP turbine will be received from 72-51-00 Assembly having been assembled and balanced. The intermediate case will be received from 72-32-00 Assembly having been assembled and pressure tested, the LP compressor rear bearing diaphragm assembly is removed from the intermediate case prior to its despatch to the HP compressor assembly.
- H. On receipt of the sub-assemblies from their various build stations ensure that the assemblies have been signed for as having had all the necessary work carried out on them, and that they are ready for inclusion in the HP compressor assembly build.

SUB-ASSEMBLY

## 2. Assemble the HP Compressor Assembly

### A. Carry out the HP Compressor Rear (No.12) Labyrinth Dimensional Check (Ref. Fig.501).

- (1) Position the drive shaft (02/3-330) on the surface table.
  - (a) If the drive shaft is supported in its fixture (Tool 1453), withdraw the fixture pin and hinge the clamp clear.
  - (b) Raise the rear (smaller diameter) end of the drive shaft, unscrew and remove the protector (Tool 1238) from the end, then screw the lifting fixture (Tool 1069) onto the rear end.
  - (c) Attach a hoist to the lifting ring of the fixture, then steadily raise the hoist guiding the shaft out of the fixture. Position and lower the drive shaft onto a surface table then remove the hoist.
- (2) Position stage 7 rotor disk (02/3-370) on the surface table.
  - (a) Attach a hoist to the lifting eye of the multiple leg sling (Tool 1086), then position the hoist over the stage 7 disk.
  - (b) Remove a thumbnut from each of the three adapters of the sling, then insert the adapter studs through three of the outer ring of bolt holes in the disk ensuring that the adapters are evenly spaced. Turn the adapters so that the step on the adapters are towards the outer diameter of the disk, then screw a thumbnut onto each adapter stud.

SUB-ASSEMBLY

**72-33-00**

Page 504

May 1/81

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (c) Raise the hoist and position and lower the disk onto three or four support blocks on the surface table.
  - (d) Release and remove the sling from the disk and the hoist. Retain thumbnuts with sling.
  - (e) Remove the disk from the support blocks and lower onto the surface table ensuring that the rear face of the disk (identified by the inner ring of bolt holes having extended bosses) is uppermost.
- (3) Position the HP compressor rear (No.12) labyrinth (02/3-300) on the surface table with the rear face uppermost (identified by the smaller external diameter). Release and remove the two halves of the protector (Tool 1239).
- (4) Using a suitable depth gauge, step gauges and a clock, check the dimensions at the following positions (Ref. Fig.501), ensuring that they are checked at a number of positions around each item, and that an average dimension is recorded.
- (a) Measure the distance from the rear labyrinth front fin rear tip to the surface table and record as dimension 'A'.
  - (b) Measure the distance on the drive shaft from its labyrinth abutment face to its disk abutment face and record as dimension 'B'.

OVERHAUL

- (c) Measure the distance on the disk from its drive shaft abutment face to the rear (top) face of the disk platforms and record as dimension 'C'.
- (5) Determine the 'G' dimension from the rear (top) face of the labyrinth front fin, to the rear (top) face of the disk platforms  $G = A + B - C$ . The dimensions should be within the following limits.
- 'A' = 0.150 to 0.155 in. (3,81 to 3,94 mm) (Pre Mod.8305 standard)
- 'A' = 0.145 to 0.155 in. (3,68 to 3,94 mm) (Mod. 8305 standard)
- 'B' = 0.340 to 0.350 in. (8,63 to 8,89 mm)
- 'C' = 0.070 to 0.085 in. (1,77 to 2,15 mm)
- 'G' = 0.405 to 0.435 in. (10,28 to 11,05 mm)
- NOTE: The dimension 'G' is required for setting up the HP compressor rear labyrinth mating part located in the delivery/combustion section (Ref. 72-00-51).
- (6) Position the two halves of the protector (Tool 1239) around the rear labyrinth, then secure the two halves with the hinge bolts and thumbnuts. Remove the labyrinth from the table and place on a suitable pallet.
- (7) Remove the stage 7 disk from the surface table.
- (a) Attach a hoist to the lifting eye of the multiple leg sling (Tool 1086), then position the hoist over the disk.
- (b) Support the disk on three or four blocks, then insert the three adapter studs through the outer ring of bolt holes in the disk ensuring the adapters are evenly spaced. Turn the adapters so that the step on the adapters are towards the outer diameter of the disk, then screw a thumbnut onto each adapter stud.
- (c) Raise the hoist and position the disk on a suitable pallet then release and remove the sling from the disk and the hoist. Screw the thumbnuts onto the adapter studs.

OVERHAUL

B. Assemble the Drive Shaft to the Beam Type Sling.  
(Ref. Fig.502).

- (1) Ensure that the beam type sling (Tool 1060) is assembled to the turnover stand (Tool 405) and that the stand arms extend downwards. If the beam type sling is not assembled to the stand, assemble it to the stand as follows.
  - (a) Attach a hoist to the lifting eye of the beam type sling, then position the beam over the stand.
  - (b) Ensure that the stand arms extend upwards, then lower the beam onto the two studs in each arm.
  - (c) Assemble a washer and nut to each stud, tighten the nuts, then release the hoist.
  - (d) Release the stand trunnion arm lock, rotate the arms 180 deg until the arms extend downwards, then apply the lock.
- (2) Attach a hoist to the lifting eye of the lifting fixture (Tool 1069) attached to the drive shaft, then raise the hoist and position the drive shaft over the turnover stand.
- (3) Identify the datum hole at the front (larger diameter) end of the drive shaft by the datum marking  $\rightarrow 0 \quad 0 \leftarrow$  on the step of the bolt hole flange (Ref. Fig.502) and the position marked 'TOP' on the beam type sling. Lower the drive shaft onto the beam type sling aligning the bolt holes and the datum mark on the drive shaft with the 'TOP' marked on the beam.
- (4) Offer a locating pin (Tool 928) into the datum hole of the drive shaft and through the hole in the beam type sling. Assemble three more locating pins to the drive shaft/beam at 90 deg spacing from the fitted locating pin. Secure the drive shaft to the beam with eight slave bolts and nuts (Tool 385), fitting a bolt to each side of each locating pin. Mark the datum hole locating pin with chalk.

OVERHAUL

- (5) Locate a support plate (Tool 378) on the labyrinth flange of the drive shaft directly above each of the four sets of pins and bolts, and secure each plate to the flange with two slave washers and bolts. Screw three support screws into each support plate until they contact the heads of the locating pins and slave bolts.
- (6) Release the hoist, then unscrew and remove the lifting fixture from the drive shaft.

NOTE: If the build is not to be continued,  
Screw a protector (Tool 1238) onto the  
threaded end of the drive shaft.

- C. Assemble the Slave Rear Roller Bearing Inner Race to the HP Drive Shaft(Ref. Fig.503).

NOTE: If the protector is assembled, remove it  
from the end of the drive shaft.

- (1) Offer the slave bearing inner race (Tool 248) over the rear (top) end of the drive shaft and lower it over the splines and onto its location on the shaft. Due to the tolerances of the two items, the race may slide onto the shaft and abut the step on the shaft without using the mechanical driver. If the race is tight, use the mechanical driver (Tool 1070) as follows:
- (a) Screw the small tommy bars of the inner pot in until the thread is nearly used up.
- (b) Offer the driver over the end of the drive shaft and screw the inner pot onto the shaft using the small tommy bars.
- (c) Screw in on the outer pot large tommy bar so that it contacts the race and pushes it onto the shaft. Tighten down on the outer pot to ensure the race abuts the step on the shaft.

OVERHAUL

- (2) If the mechanical driver was used, unscrew the inner pot from the drive shaft until released, then remove the tool.
- (3) Screw a protector (Tool 1238) onto the threaded end of the drive shaft.

D. Assemble the Rear Bearing Adapter to the Pit Stand (Ref. Fig.504).

NOTE: Ensure that the slave bearing (outer ring and rollers) (Tool 248) is assembled to the rear bearing adapter (Tool 1028) and that it is secured with a ringnut.

- (1) Offer the multiple leg sling (Tool 1054) to the rear (smaller diameter) end of the rear bearing adapter (Tool 1028) aligning the captive bolts with the tapped holes, then secure the sling to the adapter with the captive bolts.
- (2) Ensure that the arms of the pit stand (Tool 1027) extend upwards. Attach a hoist to the ring of the sling, then raise the hoist and position the adapter front flange over the pit stand arms (Ref. Fig.504). Lower the adapter locating its extensions over the stand arms and inserting its two locating pins and five studs into each stand arm. Assemble, and fully tighten, a washer and nut to each of the studs.
- (3) Release the hoist, then release and remove the sling from the adapter.
- (4) Rotate the pit stand arms 180 deg until the adapter extends downwards. Withdraw the three rollers by releasing the smaller knurled lock rings (on the outside of the adapter), and turning the larger knurled rings clockwise.

E. Assemble the HP. Drive Shaft to the Rear Bearing Adapter (Ref. Fig.504 and 505).

- (1) Release the trunnion arm lock on stand (Tool 405), then rotate the arms 180 deg so that the drive shaft extends downwards with the ring of the beam type sling (Tool 1060) uppermost, then apply the lock. Attach a hoist to the lifting ring, then release and remove the two nuts and washers securing the beam to each stand arm. (Ref. Fig.502).

- (2) Raise the hoist and position the drive shaft over the rear bearing adapter, then remove the protector (Tool 1238) from the rear (lower) end of the drive shaft, and the protector (Tool 1241) from the labyrinths. Steadily lower the drive shaft into the adapter engaging the bearing inner race (on the drive shaft) in the bearing housed in the bottom of the adapter, and engaging the beam type sling in the cutaways in the adapter (top) flange spigot. Secure each end of the beam to the adapter with two slave nuts and bolts. Release the hoist.
- (3) Rotate the pit stand arms 180 deg until the adapter extends upwards. Offer the HP drive shaft support sleeve (Tool 1031) over the drive shaft engaging the splines, then lower it until it abuts the bearing.
- (4) Offer the mechanical jack (Tool 1029) over the support sleeve and align the captive bolts with the tapped holes in the adapter. Unscrew the jack adjuster (if required), to allow the jack to abut the adapter, then screw the captive bolts into the adapter. Using the tommy bars, screw in on the jack adjuster until it abuts the support sleeve, then release the jack half a turn. Temporarily lock the jack by screwing down on the lock ring using the tommy bars.
- (5) Offer the LP drive shaft support sleeve (Tool 1030) into the assembled HP support sleeve and screw it onto the HP drive shaft. Screw the sleeve onto the shaft until it abuts the assembled HP support sleeve, then release the sleeve one and a half turns.

NOTE: Through the medium of the HP support sleeve, the mechanical jack and the LP support sleeve, the HP drive shaft is now supported and secured at its rear end to the adapter and can be raised or lowered to obtain correct settings. The LP support sleeve will also provide support for the LP drive shaft when it is assembled.

OVERHAUL

- (6) Rotate the pit stand arms 180 deg until the adapter extends downwards. Attach a hoist to the ring of the drive shaft beam type sling then release and remove the slave nuts and bolts securing the beam to the adapter and the slave nuts securing it to the drive shaft.
  - (7) Raise the hoist and position the beam type sling over its stand (Tool 405). Ensure that the stand arms extend upwards, then lower the beam onto the two studs in each arm. Assemble a washer and nut to each stud, tighten the nuts, then release the hoist. Release the stand trunnion arm lock, rotate the arms 180 deg until the arms extend downwards, then apply the lock.
- F. Centralize the HP Drive Shaft in the Rear Bearing Adapter (Ref. Fig.506).
- (1) Engage the three rollers of the adapter with the drive shaft by turning the three (larger) knurled rings (on the outside of the adapter) in a counter-clockwise direction until each roller abuts the shaft. Ensure that the rollers abut the drive shaft with equal pressure, sufficient to hold the shaft in position, but enabling it to be turned with a light pressure (when released). Lock the rollers in position by tightening the (smaller) knurled lock rings clockwise.
  - (2) Remove the checking fixture (Tool 63) from its container and locate it over one of the drive shaft slave bolts, and retain the fixture with a slave nut. Assemble a clock gauge to the fixture and secure it with the knurled nut, then adjust the position of the fixture bar and gauge to zero the gauge on the centre point of one of the three internal bosses inside the top of the adapter. Ensure the retaining nuts are fully tightened.
  - (3) Rotate the drive shaft and check the reading on the other two bosses. The T.I.R. should not exceed 0.002 in. (0,050 mm). If the T.I.R. is outside the limit, adjust on the positioning of the three rollers to bring the T.I.R. within the 0.002 in. (0,050 mm) limit. Ensure that the rollers are locked on completion of any adjustment.
  - (4) Release and remove the clock gauge. Unscrew and remove the slave nut and checking fixture and stow the fixture in its container.

OVERHAUL

- G. Assemble the LP Compressor Drive Shaft and Air Transfer Tube to the HP Drive Shaft (Ref. Fig.508).

**CAUTION:** IT IS IMPORTANT THAT AIR TRANSFER TUBES (ATT) AND HPC DRIVE SHAFTS (HPC DS) WHICH HAVE BEEN MODIFIED IN ACCORDANCE WITH SB.0L593-72-9031-411 ARE MATCHED TOGETHER AS FOLLOWS. REWORK METHOD A (ATT) ONLY ASSEMBLED WITH REWORK METHOD B (HPC DS) AND REWORK METHOD C (ATT) ONLY ASSEMBLED WITH REWORK METHOD D (HPC DS) (REF. FIG.508A).

**NOTE:** Collect the LP compressor drive shaft from its sub-assembly station (Ref. 72-31-04 Assembly) ensuring that all the necessary work has been carried out and signed for.

- (1) Unscrew and remove the protector (Tool 408) from the LP drive shaft (rear), then release the thumbnut and withdraw the hinged protector (Tool 407 and 406) from the end of the LP drive shaft (front). Screw the guide sleeve (Tool 377) onto the LP drive shaft (rear), then attach the lifting fixture (Tool 1068) to the front end of the LP drive shaft as follows (Ref.Fig.507).
  - (a) Unscrew the locknut and withdraw the keep plate from the four body pins and towards the lifting plate.
  - (b) Offer the fixture to the LP drive shaft and slide the four lobes of the body through the four cutaways in the shaft, then turn the body so that the lobes locate behind the lands in the shaft. Push the keep plate towards the shaft locating the two lobes in two of the cutaways in the shaft and over the four pins of the body. Screw on the locknut and tighten it against the keep plate.
- (2) If the LP drive shaft is in its mobile stand (Tool 1332) release the top halves of each clamp. Attach a hoist to the lifting plate, then steadily raise the hoist holding the rear end of the shaft steady in the mobile stand (Tool 1332) or transporter (Tool 1092). Position the LP drive shaft over the HP drive shaft, then lower the shaft into the HP drive shaft. Ensure that the guide sleeve on the LP drive shaft locates correctly in the LP support sleeve (Tool 1030). Disconnect the hoist.

- (3) Remove the lifting fixture (Tool 1068) from the LP drive shaft by releasing the locknut, withdrawing the keep plate, then turning the body until its lobes align with the cutaways in the shaft, withdraw the body.
- (4) Identify the datum screw of the lifting/assembly fixture (Tool 1071) by examining the inside face of the screw flange for two scribed lines, one on each side of the datum screw. If the datum screw is not indicated, determine the datum screw and mark the casing as follows (Ref. Fig.508).
  - (a) Examine the circumference of guide (Tool 1072) for two scribed lines, one to each side of one of the four bushes. This bush is to be assembled to the location pin in the disk datum bolt hole in the HP rotor shaft (Ref. para.(8)).
  - (b) Offer the lifting/assembly fixture into the centre of the guide and align the three offset cutaways in the assembly fixture flange with the three offset guide bars in the guide.
  - (c) Trace a line from the datum bush in the guide (Ref. para.(a)) and paint a datum mark on the outside casing of the assembly fixture adjacent to the appropriate screw. This screw will be the datum screw and will screw into the datum hole in the air transfer tube.
- (5) With the rear (larger diameter) of the air transfer tube resting on a clean flat surface, examine the front (top) inside diameter for the datum mark  $\rightarrow 0$  on the scalloping arrowed to one of the flats, or  $\rightarrow 0 \leftarrow$  on the flat itself. The tapped hole in line with the flat is the datum hole.
- (6) Attach a hoist to the lifting/assembly fixture (Tool 1071), then raise the hoist and position the fixture over the air transfer tube. Lower the hoist and align the datum screw of the fixture with the datum hole in the tube. When the fixture abuts the tube, screw the fixture captive screws into the tube and fully tighten the screws.

OVERHAUL

- (7) With the aid of the hoist, place the fixture and tube in an oven for (approx.) 20 min at 100 deg C.
  - (8) Offer the guide (Tool 1072) to the H.P. drive shaft and align the datum bush, identified by two scribed lines on the circumference of the guide, with the location pin in the datum hole in the shaft, identified by the datum mark O on the scalloping inside the front (top) of the shaft and arrowed to a flat in line with a bolt hole. Screw slave nuts onto the eight slave bolts and tighten the nuts. Chalk a datum mark on the drive shaft, below the support plate and in line with the datum hole, for future reference.
  - (9) With the aid of a hoist and protective gloves, remove the lifting/assembly fixture and the air transfer tube from the oven. Position the air transfer tube over the LP drive shaft, then release and remove the protector (Tool 406) (if assembled) from the LP drive shaft (upper) labyrinth. Steadily lower the hoist guiding the transfer tube over the LP drive shaft until the flange on the assembly fixture nears the guide. Ensure that the guide bars are fully inwards and that they are locked with the knurled nuts, then align the three offset cutaways in the assembly fixture with the three offset guide bars. Lower the air transfer tube and ensure that the tube locates over the spigot on the HP drive shaft.
  - (10) When the assembly fixture and air transfer tube have cooled to the workshop temperature, release the assembly fixture knurled screws, then raise the hoist and remove the fixture. Lower the fixture then release the hoist.
  - (11) Offer the steady (Tool 287) over the LP drive shaft and secure it to the transfer tube with the two captive bolts.
  - (12) Release and remove the eight slave nuts securing the guide to the HP drive shaft, then remove the guide.
- H. Assemble the HP Compressor Rear Case to the Rear Bearing Adapter.
- (1) Ensure that the HP rear case is complete and ready for assembly, with the exit guide vanes, blanks etc. assembled (Ref.72-33-01 Assembly).
  - (2) Assemble the multiple leg sling (Tool 1960) to the rear case front (larger dia) flange.

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (a) Release and remove the thumbscrews from the three attachment brackets.
- (b) Evenly dispose the three brackets on the front flange, then secure them to the flange with the thumbscrews.
- (3) Attach a hoist to the ring of the sling, then raise the hoist and position the case over the LP drive shaft. Steadily lower the case and align the locating pin in the rear (bottom) flange with the locating pin hole in the rear bearing adapter flange (in line with the lifting eye). Ensure that the bolt-holes in each item are aligned, then secure the rear case to the adapter with slave D-headed bolts and nuts.
- (4) Release and remove the sling from the rear case, then remove the hoist from the sling.

NOTE: If the build is not to be continued, place the wooden protector (Tool 1359) over the exit guide vanes.

J. Assemble the Stage 6-7 Spacer Ring to the Stage 7 Compressor Disk (Ref.Fig.511).

- (1) Remove the stage 6-7 spacer ring (02/3-390) from its container (Tool 1441) and place its front face (with the centre ring of bolt-holes) on a clean protected flat surface.

NOTE: On engines incorporating SB.72-99, at each build it is essential to use new SB.72-8766-291 standard nuts (3-340) and bolts (3-350A). Engines not incorporating SB.72-99, use new nuts only.

- (2) Apply lubricant 'A' to the threads and fitting dia of the bolts (02/3-350A SB.72-8766-291 standard). Assemble a bolt to the outer ring of bolt-holes (from inside the spacer), screw an assembly pin (Tool 978) onto the bolt then lower the bolt to rest on the spacer. Assemble the remaining 35 bolts to the spacer and screw an assembly pin onto each bolt.
- (3) Invert the spacer and place a number of support blocks under the spacer to raise it (approx.) five inches. Apply lubricant 'A' to the threads and fitting dia of the bolts (02/3-380), then insert the 36 bolts, from the underside, through the centre ring of bolt-holes so that they extend upward and the flats on the heads of the bolts lock against the spacer. Assemble a retaining clip (Tool 1038) to the protruding part of each bolt so that the clips abut the spacer.

SUB-ASSEMBLY

**72-33-00**

Page 521

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (4) Examine the rear of the spacer ring (inward facing flange) for a double datum mark 00 on the flat, or on the scalloping pointing to the flat. The spacer datum hole is in the outer ring of holes and in line with the mark. To assist assembly chalk a datum line on the front face of the spacer in line with the datum hole.
- NOTE: The centre ring of bolts in the spacer secure the stage 6 disk and the datum mark chalked on the spacer will also be the datum for assembly of the stage 6 disk.
- (5) Position the three support blocks (Tool 608) on a work surface and ensure the correct location pins (Tool 604) are assembled to the blocks.
- (6) Attach a hoist to the lifting eye of the multiple leg sling (Tool 1086) then position the hoist over the stage 7 disk (02/3-370). Ensure that the front face of the disk, identified by the inward slope of the blade platforms, is uppermost. Remove the thumbnuts from each of the sling adapters then insert the adapter studs through three of the outer ring of bolt-holes in the disk, ensuring the adapters are evenly spaced. With the step on adapters facing outward screw a thumbnut onto each adapter stud.
- (7) Raise the hoist and position the disk above the three support blocks, align the pins in the blocks with the inner ring of bolt-holes in the disk. Lower the disk onto the pins, unscrew and remove the thumbnuts from the sling adapters raise the hoist and remove the sling. Identify, in the outer ring of bolt-holes, the datum hole of the disk by the datum mark 00 on the outer blade platforms, adjacent to the No.1 blade slot, the hole is in line with the mark.
- (8) Identify the stage 7 blades (02/3-360), remove them from their container, then examine the blade roots for their positional No. and lay them out in numerical sequence. Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades, then insert the blades in numerical sequence into the front face of the disk, starting at No.1 position and working in an anti-clockwise direction when viewing from above.

IN30420

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (9) Position the shield (Tool 1922), with the outer flange uppermost, over the blades. Invert the heater (Tool 757), on its stand (Tool 759), so that the heater handles are uppermost. Attach the shackles of the multiple leg sling (Tool 1645) to the handles of the heater then connect the sling to a hoist (Ref.Fig.509).
- (10) Raise the hoist and position the heater above the disk then lower the hoist until the heater rests within the shield. Heat the disk to 70 deg C by operating the heater control (Tool 758).

NOTE: If the heater, control or stand are not available, use suitable units based on the wiring diagram (Ref.Fig.509).

- (a) Connect the heater control input supply plug to a suitable mains supply connection and turn the mains switch 'ON'.
- (b) Turn the three 'HEATER CONTROLS' band switches to 'FULL'.
- (c) Turn the heater time controller to nine minutes.
- (d) Switch the 'HEATERS' toggle switch to 'ON', then press the 'TIMER START' push button to start the heating cycle. During the period the heater is on, the 'ON' indicator light will remain illuminated, and at the completion of 9 min the heaters and light will automatically be switched off.
- (e) When the timer switch cuts out, switch the 'HEATERS' toggle switch to 'OFF' the 'HEATER CONTROLS' switches to 'OFF' and the mains supply switch to 'OFF'.

- (11) Assemble the lifting equipment (Tool 1088) to the stage 6-7 spacer ring.

NOTE: Do not remove the retaining clips from the bolts to which the sling is attached.

- (a) Attach a hoist to the sling and position the sling above the spacer.

OVERHAUL

- (b) Position the three sling adapters evenly around the spacer and screw the thumbnuts onto the spacer bolts held captive by the retaining clips. Identify the datum hole of the spacer.
- (c) Raise the hoist and position the spacer close to the disk being heated.
- (12) Immediately the disk heating cycle is complete raise the hoist and remove the heating unit from the disk. Reposition the heating unit on the mobile stand then disconnect and remove the hoist.
- (13) Using protective gloves remove the shield from the blades then position the spacer above the disk and align the datum holes of disk and spacer. Lower the spacer and engage the assembly pins, attached to outer ring of bolts in the spacer, with the bolt-holes in the disk, continue to lower the spacer until it abuts the disk.
- (14) Unscrew the thumbnuts from the sling adapters then raise the hoist and remove the sling. Allow the assembly of disk/spacer to cool to normal workshop temperature.
- (15) Using the scissor retaining clips (Tool 1923) hold one of the outer ring of bolts, unscrew and remove the assembly pin then screw a nut (O2/3-340 Ref. SB.72-8766-291) onto the bolt, repeat the procedure until all assembly pins have been removed.
- (16) Ensure each nut has a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m) then tighten the bolts sufficient to prevent separation of disk and spacer when lifting the assembly.
- (17) Remove the retaining straps from the blades.
- K. Assemble the Stage 7 Disk/6-7 Spacer Ring to the HP Drive Shaft.
- (1) Assemble the sling (Tool 1088) to the stage 6-7 spacer ring.
- (a) Attach a hoist to the sling and position the sling above the disk/spacer assembly.

SUB-ASSEMBLY

72-33-00

Page 525

Sep 1/81

- (b) Position the three sling adapters evenly around the spacer and screw the thumbnuts onto the spacer bolts held captive by the retaining clips.

NOTE: Do not remove the retaining clips from the bolts to which the sling is attached.

- (2) Position the heating unit (Tool 757) with its heating coils uppermost, then assemble the heat shield, outer flange pointing downward to the heater. Raise the hoist and position the disk/spacer on the heating unit.
- (3) Heat the assembly to 70°C operating the heating equipment in accordance with para.J.(9).
- (4) Immediately the heating cycle is complete raise the hoist and position the assembly above the LP drive shaft. Align the datum hole, in the inner ring of holes, with the chalked datum pin in the HP drive shaft flange. The datum hole is in line with the double datum mark  pointing downwards on the outer blade platforms adjacent to the No.1 blade slot. Lower the hoist and ensure the disk abuts the drive shaft, unscrew the thumbnuts on the sling adapters raise the hoist and remove the sling.
- (5) Allow the disk/spacer to cool to workshop temperature. Gain access through the apertures in the rear bearing adapter and unscrew and remove the bolts securing the four support plates which are attached to the HP drive shaft and remove the plates. Remove the location pins and slave bolts from the disk/spacer.
- (6) Examine the heads of the bolts (02/3-320) for positional numbers and lay them out in numerical sequence. If new bolts are to be used, etch a number on the head of each bolt from 1 to 24. Replacement bolts are to be numbered with the number of the bolts being replaced.
- (7) Apply lubricant 'A' to the threads and fitting dia of the bolts. Identify the datum hole for the inner ring of disk/spacer bolts and insert No.1 bolt, locating the flat on the bolthead against the spacer. Insert the remaining 23 bolts in numerical sequence in a counter-clockwise direction as viewed from above. Apply lubricant 'A' to locknuts (02/3-310) then gain access through the rear bearing adapter access holes, screw the nuts onto the bolts.

OVERHAUL

- (8) With stepped face of index plate (Tool 1924) on the underside, position plate over the LP drive shaft. Align inner ring of holes in plate with the captive bolts in the spacer, lower plate onto the bolts and secure with four slave nuts (Ref. Fig.510).

NOTE: Do not remove any retaining clips from the spacer bolts.

- (9) Attach a hoist to the restrainer (Tool 1925) then raise the hoist and position the restrainer over the LP drive shaft. Lower the hoist until the restrainer flange abuts the HP compressor rear case, align the holes and secure the retainer to the case with five slave bolts, nuts and washers. Rotate the stage 7 disk/spacer and engage the restrainer locking pin in one of the outer ring of holes on the index plate. Screw in the thrustpad of the restrainer until it abuts the LP drive shaft then screw in the three cap-screws of the restrainer until they abut the steady (Tool 287).
- (10) Rotate pit stand arms until rear bearing adapter extends upward. Gain access through ports in the rear bearing adapter and torque-tighten the nuts (02/3-310) around the HP drive shaft flange using the cranked ring wrench (Tool 1517). Check the torque loading of wrench in accordance with 72-09-00 Assembly, then tighten nuts in accordance with the following procedure and order. Ensure each nut has a minimum locking (run-down) torque of 14 lbf in. (1,6 N.m) and torque-tighten (in the correct sequence) in 100 lbf in. (11,5 N.m) increments to a final torque of 690 lbf in. (78 N.m) and in the sequence: 1, 13, 7, 19, 4, 16, 10, 22, 2, 14, 8, 20, 5, 17, 11, 23, 3, 15, 9, 21, 6, 18, 12 and 24. Torque-tighten the outer ring of nuts (02/3-340) to 100 lbf in. (11,5 N.m) in the following sequence: 1, 19, 28, 10, 32, 14, 23, 6, 36, 18, 27, 9, 31, 13, 21, 3, 35, 17, 26, 8, 30, 12, 25, 7, 33, 16, 24, 5, 34, 15, 22, 4, 29, 11, 20, 2. After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 2.5 thread pitches beyond nut chamfer, the bolt must be renewed (Ref.SB.72-8446-172).

NOTE: With the locking pin of the restrainer engaged in the index plate the HP drive shaft can be locked in any desired position. To rotate the HP shaft to a new position, withdraw the locking pin, rotate the shaft and re-engage the pin in the index plate.

SUB-ASSEMBLY

**72-33-00**

Page 528

Dec 1/81

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (11) Rotate the pit stand arms until the restrainer is uppermost then attach a hoist to the restrainer. Unscrew and remove the five nuts and bolts securing the restrainer to the HP compressor rear case then raise the hoist and remove the restrainer. Unscrew and remove the four slave nuts securing the index plate to the stage 7 disk/spacer then remove the plate.

NOTE: The HP drive shaft and stage 7 disk should now be set up, relative to the HP compressor rear case, in order that the remainder of the compressor can be assembled in the correct position to check the tip clearance of the compressor blades and vanes.

- (12) Release the lockring of the mechanical jack (Ref. Fig.505) then raise or lower the HP drive shaft until the three checking gauges (Tool 57) can be inserted between the stage 7 disk and the internal bosses of the rear bearing adapter (Ref.Fig.511). Using the above tool will ensure this dimension conforms to the Fits and Clearance Schedule 72-33-00 120. Ensure the mechanical jack is locked, using the lockring, after any adjustment.

NOTE: The clearance between gauge and disk should only be sufficient to facilitate entry and removal of the gauges.

- (13) Remove the three gauges from the rear bearing adapter. Using feeler gauges check the tip clearance between the stage 7 compressor blades and the HP compressor rear case. Find the longest blade, then check the minimum tip clearance of the longest blade and the case at eight equi-spaced positions. Ensure the minimum tip clearance is in accordance with the Fits and Clearance Schedule 72-33-00 F.C.S.146.

NOTE: If the build is not to be continued, place the wooden protector (Tool 1359) over the compressor blades.

- L. Assemble the Stage 6 Stator Vanes to the Rear Case  
(Ref.Fig.512 and 512A).

NOTE: If the wooden protector is fitted, remove it from the compressor blades.

- (1) On engines to SB.72-8806-313 standard, assemble the liners (8-115-116) to the stage 6 vane grooves. Ensure that the end gaps of the liners are aligned with the blade loading slot and that the bolt and probe holes in the case are not obscured by the liners.

NOTE: Ensure that any repaired vanes are evenly distributed around the case and that the aggregate depth of blending does not exceed 2.000 in. (50,8 mm)  
(Ref.72-33-01, Repair No.2).

- (2) Apply lubricant 'A' to the stage 6 vane groove or liner.

- (3) With the trailing edge (shorter length) of the vane at the bottom, offer the vanes to the groove loading slot at the left-hand side viewed from above, and engage them in the groove, then ease them round the groove in either direction. Assemble 91 vanes (3-30), 6 probe vanes (3-50) and 3 bolted vanes (3-40) to the positions shown on Fig.512.

NOTE: Compressor case rear to Mod. 0L.8039 standard (B515596, B515597, B925037, B925038, B936646 and B936647) may incorporate up to qty 4 off handed probe vanes (3-51 and 3-52), in lieu of standard probe vanes (3-50). These vanes should be assembled in the order shown in Fig.512A.

- (4) Apply lubricant 'C' to the new bolts (3-10), then secure each bolted vane and the probe vane at 'D' with two sleeves (3-20) and bolts (3-10). Torque-tighten the bolts to 100 lbf in. (11,5 N.m), then wire-lock the two bolts of each vane to one another.
- (5) Check that the probe vanes are correctly assembled and positioned, by inserting the pin gauge (Tool 289) through the case and the holes in the vanes on each side of the case.

- (6) Using feeler gauges, check the clearance between stage 6 vanes and the spacer ring. Check each vane by (lightly) pulling the vane upwards (forward) to take up the play, then inserting the feeler at the mid position of the vane tip. Turn the HP drive shaft 90 deg and recheck each stator vane. Repeat the check with the shaft turned two further 90 deg turns. The minimum tip clearance must not be less than that quoted in the Fits and Clearance Schedule 72-33-00 F.C.S.136.

NOTE: If the build is not to be continued, place the wooden protector (Tool 1359) over the stator vanes.

- M. Assemble the Stage 6 Bladed Compressor Disk and Stage 5-6 Spacer Ring (Ref.Fig.513 and 514).

NOTE: If the wooden protector is assembled, remove it from the stator vanes.

- (1) Screw an assembly pin (Tool 1065) on to each of the bolts protruding from the stage 6-7 spacer ring. Withdraw the clips from the bolts and lower the bolts to rest on the stage 7 disk.
- (2) Ensure that the front face of the disk (02/2-120) is uppermost, by the inward slope of the disk and blade platforms towards the front and the blade tangs underneath.
- (3) Examine the blade platforms and identify the two adjacent platforms to No.1 blade with datum marks 0 then chalk a datum mark on the front face of the disk in line with the bolt hole between the datum marks.
- (4) Assemble a retainer strap (Tool 1166) to consecutive groups of six or seven blades, so that every blade has been strapped to a series of blades, then remove the blade retainer from the blade tips. Remove the masking tape (if assembled) from the blade roots rear (bottom) face, then ensure that the face of the disk and blade roots/tangs are perfectly clean.

NOTE: The retainer straps prevent the blades from dropping out of the disk when it is raised.

- (5) Assemble the multiple leg sling (Tool 404) to the stage 6 disk (Ref. Fig.513).
  - (a) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.
  - (b) Ensure that the three lifting clip chains are positioned in the outermost slot of each plate. Loosen the wingnut on each lifting clip, then ensuring that the three clips are evenly disposed around the disk, locate each clip under a blade.

- (c) Position the keep plate (of each lifting clip) over the top of a blade, and ensuring that the keep and lifting clips are abutting the blades, secure each clip with its wingnut.
- (6) With the heater (Tool 757) correctly positioned, heating coils uppermost, on its mobile stand (Tool 759) position the shield (Tool 1922) on the heater, this shield will protect the blade retaining straps. Position the disk over the heater then lower the disk to rest within the shield. With Ref. to para.J, (9) for the operation of the heater, set the time controller to 9 min and heat the disk to 60 deg C.
- (7) On completion of the heating cycle, hoist the disk and position and lower it over the LP drive shaft and above the assembly pins assembled to the spacer ring. Insert an alignment rod (Tool 1955) through the datum hole of the disk (Ref. para. (3)) and insert it into the marked assembly pin in the datum hole of the spacer ring. Insert an alignment rod through each hole in the disk and into the assembly pin aligned underneath. Lower the disk, and using the alignment rods, guide the disk over the assembly pins until the disk abuts the spacer. Ensure that the blades are in the fully forward (upward) position, otherwise the blades will contact the outside dia of the spacer preventing the disk from abutting the spacer.
- (8) Release and remove the sling from the blades, then remove the sling from the hoist. Withdraw the alignment rods from the assembly pins, and the retainer straps from the blades.
- (9) Pull up on the assembly pins until all the thread and a small waisted portion of the bolts are visible, then clip a retaining clip (Tool 1038) onto the waisted portion of each bolt as it is pulled up. Ensure that the clips extend towards the centre of the disk. If a bolt does not pull up sufficiently, apply a light upward pull on the assembly pin, then turn the pin to align the bolt head with the spacer (ensuring that the pin is not unscrewed from the bolt), and pull up on the pin. If any of the bolts are too tight to pull up with the assembly pins, proceed as follows:
- (a) Screw the mechanical driver (Tool 1064) onto a pin (Ref.Fig.514), then insert the appropriate locating key (Tool 1066 or 1079) into the assembly pin locating the key into the slot in the bolt.

SUB-ASSEMBLY

72-33-00

OVERHAUL

**NOTE:** Use locating key (Tool 1066) with assembly pins (Tool 1065) and locating key (Tool 1079) with assembly pins (Tool 1067).

- (b) Lock the locating key by screwing the thumbnut onto the assembly pin, then turn the key handle until it points towards the centre of the disk, this aligns a flat on the bolt head with the spacer.
- (c) Screw down on the driver tommy bars and draw the bolt up until it abuts the spacer ring.
- (d) Release and remove the locating key and driver, clip a retaining clip onto the waisted portion of the bolt, then remove the assembly pin.
- (e) Repeat the procedure on any bolt that is tight.

**NOTE:** If all the bolts are tight, then the disk has not been heated sufficiently and must be removed and reheated. Do not attempt to draw all the bolts up using the mechanical driver.

**NOTE:** If the assembly of the disk to the spacer has been carried out without any delays, the disk will be hot enough to enable the spacer to be assembled without reheating the disk (Ref. para.(10) and (11)). If delays have caused the disk to cool, reheat the disk (Ref. para.(12), (d) to (e) prior to assembling the spacer ring.

**NOTE:** Care must be taken to ensure that during the assembly of the spacer, the bolts protruding through the disk are not displaced from the clips and allowed to drop from the disk.

If this occurs, the bolt(s) cannot be repositioned, and the disk and stage 6-7 spacer ring will have to be removed from the stage 7 disk (Ref. 72-33-00 Disassembly).

- (10) Remove the stage 5-6 spacer ring (02/2-100) from its container (Tool 1441) and examine the front (smaller dia) internal flange edge of the spacer ring for two datum marks  $\rightarrow 00 \leftarrow$  on scalloping pointing to a flat. The hole in line with the flat is the datum hole for the front face. Offer the spacer to the stage 6 disk, positioning the front datum hole to the left of the disk datum hole (as viewed from above), then lower the spacer over the bolts and rest it on the retaining clips, ensuring that none of the bolts are pushed down (Ref.Fig.511).
- (11) Apply lubricant 'A' to nuts (02/2-90), then screw the nuts onto the bolts ensuring that the nuts do not abut the spacer preventing the removal of the clips. Withdraw the retaining clips from the bolts and lower the spacer ensuring it abuts the disk. Use the wrench (Tool 1956) and torque-tighten the nuts in the following sequence: 1, 19, 28, 10, 32, 14, 23, 6, 36, 18, 27, 9, 31, 13, 21, 3, 35, 17, 26, 8, 30, 12, 25, 7, 33, 16, 24, 5, 34, 15, 22, 4, 29, 11, 20 and 2 ensuring that the nuts have a minimum locking (run-down) torque of 9.5 lbf in. (1.1 N.m). Torque-tighten the nuts (in the correct sequence) in 80 lbf in. (9.0 N.m) increments, to a final torque of 450 lbf in. (51 N.m). During the torque-tightening of the nuts should it be found necessary to re-align the flats on the boltheads with the spacer use the angled key (Tool 1952).

NOTE: If the disk had cooled to the extent of preventing the spacer abutting the disk (because of the interference fit between the two), proceed as detailed in para.(12).

- (12) If on lowering the spacer onto the disk the spacer would not assemble proceed as follows:
- (a) Assemble the retaining clips to the bolts (under the spacer), then remove the nuts from the bolts.
  - (b) Withdraw the spacer from the bolts, then check that the retaining clips are correctly clipped to the waisted portion of the bolts.

FN34270

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (c) Assemble six equi-spaced packing pieces (Tool 1950) to the bolts and retain with slave nuts. Remove the retaining clips from these bolts and tighten the nuts to ensure the stage 6 disk is correctly seated on the stage 6-7 spacer. Unscrew the nuts sufficient to allow reassembly of the retaining clips, beneath the packing pieces, to the spacer retaining bolts then assemble the clips and remove the nuts and packing pieces.
- (d) Invert the heater unit (Tool 757) on its stand so that the heater handles are uppermost. Attach the shackles of the multiple leg sling (Tool 1645) to the handles of the heater then connect the sling to a hoist (Ref.Fig.509).
- (e) Position and lower the heater over the LP drive shaft and onto the disk. With Ref. to para.J, (9) for the operation of the heater, set the time controller to 9 min and heat the disk to 60 deg C.
- (f) On completion of the heating cycle remove the heater and place in on its stand.
- (g) Assemble the spacer ring to the disk as detailed in para.(10) and (11).
- (13) Using feeler gauges, check the tip clearance between the stage 6 compressor blades and the HP rear case. Find the longest blade, then check the minimum tip clearance of the longest blade and the case at eight equi-spaced positions. Ensure the minimum tip clearance is in accordance with the Fits and Clearance Schedule 72-33-00 F.C.S.145.
- (14) Apply lubricant 'A' to the threads and fitting dia of the bolts (02/2-80), then assemble a bolt to each bolt hole in the front flange of stage 5-6 spacer ring (from the inside of the spacer), screw an assembly pin (Tool 1065 or 1067) onto each bolt and lower the bolt heads to rest on the spacer. Position the bolts to align a flat on each bolt head with the step in the spacer, for ease of locating the bolt heads when the bolts are pulled up into position.

SUB-ASSEMBLY

**72-33-00**

OVERHAUL

- (15) Examine the front flange of the spacer ring for two datum marks  $\rightarrow 00 \leftarrow$  on scalloping pointing to a flat. The hole in line with the flat is the datum hole for the front flange, and to identify the hole during the assembly of the stage 5 disk, mark the assembly pin.

NOTE: If the build is not to be continued, place a wooden protector (Tool 1359) over the blades.

N. Assemble the HP Compressor Front Case to the HP Compressor Rear Case.

- (1) Ensure that the HP front case is complete and ready for assembly with the stage 5 stator vanes etc. assembled (Ref. 72-33-01 Assembly).

- (2) Assemble the multiple leg sling (Tool 1053) to the front case.

(a) Release and remove the thumbscrews from the three attachment brackets.

(b) Evenly dispose the three brackets on the front (smaller diameter) flange of the case and secure them to the flange with thumbscrews.

NOTE: If the wooden protector (Tool 1359) is assembled to the compressor blades, remove it.

- (3) Attach a hoist to the ring of the sling, then raise the hoist and position the front case over the LP drive shaft. Steadily lower the front case and align the locating pin in the rear (bottom) flange with the locating pin hole in the rear case taking care to guide the stator vanes in the front case over the spacer ring assembly in the rear case. Ensure that the bolt-holes in each item are aligned.
- (4) With Ref. to Fig.515 for the positioning of brackets and bolts (bolts are inserted from the HP rear case), secure the front case to the rear case having lubricated the bolts with lubricant 'A'. Ensure the nuts have a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m) then torque-tighten to 100 lbf in. (11,5 N.m).

SUB-ASSEMBLY

OVERHAUL

- (5) Check that the probe vane access holes at the stage 6 location in the compressor case front are aligned with the holes in the compressor case rear by inserting a pin gauge (Tool 289) through both cases and the holes in the vanes.
  - (a) Compressor case front with twin probe access. Apply lubricant 'A' to the four blanking plugs (4-300 and 5-410), assemble a washer (4-310 and 5-420) to each plug, then screw the plugs into the probe access holes on the left-hand and right-hand sides of the case. Torque-tighten the plugs to 65 lbf in. (7,3 Nm), then wire-lock each pair of plugs together.
  - (b) Compressor case front with single probe access. Apply lubricant 'A' to the two blanking plugs (4-300 and 5-410), assemble a washer (4-310 and 5-420) to each plug, then screw the plugs into the probe access holes on the left-hand and right-hand sides of the case. Torque-tighten the plugs to 65 lbf in. (7,3 Nm), then wire-lock the plugs to the adjacent stage 5 blanking plug.
- (6) Release and remove the sling from the front case, then remove the hoist from the sling.
- (7) Using feeler gauges, check the tip clearance between the stage 5 stator vanes and the spacer ring. Check each vane by (lightly) pulling the vane forward (up) to take up the play, then inserting the feeler at the mid position of the vane tip. Rotate the HP drive shaft 90 deg and recheck each stator vane. Repeat the check with the shaft turned two further 90 deg turns. Ensure the minimum tip clearance is in accordance with the Fits and Clearance Schedule 72-33-00 F.C.S.137.

NOTE: If the build is not to be continued, place the wooden protector (Tool 1360) over the stator vanes.

P. Assemble the Stage 5 Bladed Compressor Disk and Stage 4-5 Spacer Ring.

- (1) Ensure that the front face of the disk (02/2-70), identified by the inward slope of the disk and blade platforms, is uppermost.

- (6) On completion of the heating cycle, hoist the disk and position and lower it over the LP drive shaft and above the assembly pins assembled to the spacer ring. Insert an alignment rod (Tool 1955) through the datum hole of the disk (Ref. para.(2)) and insert it into the marked assembly pin in the datum hole of the spacer ring. Insert an alignment rod through each hole in the disk and into the assembly pin aligned underneath. Lower the disk, and using the alignment rods, guide the disk over the assembly pins until the disk abuts the spacer. Ensure that the blades are in the fully forward (upward) position, otherwise the blades will contact the outside dia of the spacer preventing the disk from abutting the spacer.
- (7) Release and remove the sling from the blades, then remove the sling from the hoist. Withdraw the alignment rods from the assembly pins, and the retainer straps from the blades.
- (8) Pull up on the assembly pins until all the thread and a small waisted portion of the bolts are visible, then clip a retaining clip (Tool 1038) onto the waisted portion of each bolt as it is pulled up. Ensure that the clips extend towards the centre of the disk. If a bolt does not pull up sufficiently, apply a light upward pull on the assembly pin, then turn the pin to align the bolthead with the spacer (ensuring that the pin is not unscrewed from the bolt), should any of the bolts be too tight to pull up with the assembly pins, proceed as follows:
- (a) Screw the mechanical driver (Tool 1064) on to a pin (Ref. Fig.514), then insert the appropriate locating key (Tool 1066 or 1079) into the assembly pin locating the key into the slot in the bolt.

**NOTE:** Use locating key (Tool 1066) with assembly pins (Tool 1065), and locating key (Tool 1079) with assembly pins (Tool 1067).

- (b) Lock the locating key by screwing the thumbnut onto the assembly pin. Turn the key handle until it points towards the centre of the disk to align a flat on the bolthead with the spacer.
- (c) Screw down on the driver tommy bars and draw the bolt up until it abuts the spacer ring.

OVERHAUL

(d) Release and remove the locating key and driver, clip a retaining clip onto the waisted portion of the bolt, then remove the assembly pin.

(e) Repeat the procedure on any bolt that is tight.

NOTE: If all the bolts are tight, then the disk has not been heated sufficiently and must be removed and reheated. Do not attempt to draw all the bolts up using the mechanical driver.

NOTE: If the assembly of the disk to the spacer has been carried out without any delays, the disk will be hot enough to enable the spacer to be assembled without reheating the disk (Ref. para. (9) and (10)). If delays have caused the disk to cool, reheat the disk (Ref. para. (11), (c) to (e)) prior to assembling the spacer ring.

NOTE: Care must be taken to ensure that during the assembly of the spacer, the bolts protruding through the disk are not displaced from the clips and allowed to drop from the disk. If this occurs, the bolt(s) cannot be repositioned, and the disk will have to be removed from the stage 5-6 spacer (Ref. 72-33-00 Disassembly).

(9) Remove the stage 4-5 spacer ring (02/2-50) from its container (Tool 1441) and examine the front (smaller dia) internal flange edge of the spacer ring for two datum marks 00 on scalloping pointing to a flat. The hole in line with the flat is the datum hole for the front face. Offer the spacer to the stage 5 disk, positioning the front datum hole to the right of the disk datum hole (as viewed from above), then lower the spacer over the bolts and rest it on the retaining clips, ensuring that none of the bolts are pushed down.

OVERHAUL

- (10) Apply lubricant 'A' to nuts (02/2-40), then screw the nuts onto the bolts ensuring that the nuts do not abut the spacer preventing the removal of the clips. Withdraw the retaining clips from the bolts and lower the spacer ensuring it abuts the disk. Using the wrench (Tool 1956) torque-tighten the nuts in the following sequence: 1, 19, 28, 10, 32, 14, 23, 6, 36, 18, 27, 9, 31, 13, 21, 3, 35, 17, 26, 8, 30, 12, 25, 7, 33, 16, 24, 5, 34, 15, 22, 4, 29, 11, 20 and 2, ensuring that the nuts have a minimum locking (run-down) torque of 9.5 lbf in. (1,1 N.m). Torque-tighten the nuts (in the correct sequence) in 80 lbf in. (9,0 N.m) increments, to a final torque of 450 lbf in (51 N.m). During the torque-tightening of the nuts should it be necessary to re-align the flats on the boltheads with the spacer use the angled key (Tool 1952).

NOTE: If the disk had cooled to the extent of preventing the spacer abutting the disk (because of the interference fit between the two), proceed as detailed in para.(11).

- (11) If on lowering the spacer onto the disk the spacer would not assemble proceed as follows:
- (a) Assemble the retaining clips to the bolts (under the spacer), then remove the nuts from the bolts.
  - (b) Withdraw the spacer from the bolts, then check that the retaining clips are correctly clipped to the waisted portion of the bolts.
  - (c) Assemble six equi-spaced packing pieces (Tool 1950) to the bolts and retain with slave nuts. Remove the retaining clips from these bolts and tighten the nuts to ensure the stage 5 disk is correctly seated on the stage 5-6 spacer. Unscrew the nuts sufficient to allow reassembly of the retaining clips, beneath the packing pieces, to the spacer retaining bolts then assemble the clips and remove the nuts and packing pieces.
  - (d) Invert the heater (Tool 757) on its stand so that the heater handles are uppermost. Attach the shackles of the multiple leg sling (Tool 1645) to the handles of the heater then connect the sling to a hoist (Ref.Fig.509).

OVERHAUL

- (e) Position and lower the heater over the LP drive shaft and onto the disk. With Ref. to para.J, (9) for the operation of the heater, set the time controller to 9 min and heat the disk to 60 deg C.
  - (f) On completion of the heating cycle remove the heater and place in on its stand.
  - (g) Assemble the spacer ring to the disk as detailed in para.(9) and (10).
- (12) Using feeler gauges, check the tip clearance between the stage 5 compressor blades and the HP front case. Find the longest blade, then check the minimum tip clearance of the longest blade and the case at eight equi-spaced positions. Ensure minimum tip clearance is in accordance with the Fits and Clearance Schedule 72-33-00 F.C.S.144.
- (13) Apply lubricant 'A' to the threads and fitting dia of the bolts (02/2-30), then assemble a bolt to each bolt-hole in the front flange of stage 4-5 spacer ring (from the inside of the spacer), screw an assembly pin (Tool 1065 or 1067) onto each bolt then lower the bolt to rest on the spacer. Position the bolts to align the flat on each bolthead with the step in the spacer, for ease of locating the boltheads when the bolts are pulled up into position.
- (14) Examine the front flange of the spacer ring for two datum marks 00 on scalloping pointing to a flat. The hole in line with the flat is the datum hole for the front flange, and to identify the hole during the assembly of the disk, mark the assembly pin.

NOTE: If the build is not to be continued, place a wooden protector (Tool 1360) over the blades.

- Q. Assemble the Stage 4 Stator Vanes and Blanks to the Front Case (Ref. Figs.516 and 516A).

NOTE: If the wooden protector is assembled, remove it from the compressor blades.

NOTE: Ensure that any repaired vanes are evenly distributed around the case and that the aggregate depth of blending does not exceed 1.400 in. (35,56 mm) (Ref.72-33-01, Repair No.2).

- (1) Apply lubricant 'A' to the stage 4 vane grooves.

- (2) With the trailing edge (shorter length) of the vanes at the bottom, offer the vanes to the groove loading slot at the right-hand side as viewed from above, and engage them in the groove, then ease them round the groove in either direction.
- (a) Compressor case front with twin probe access (Ref.Fig.516). Assemble 62 vanes (2-170), 4 probe vanes (2-190) and 6 bolted vanes (2-180) to the groove in the position shown in Fig.516. Ensure that the bolted vanes align with the bolt holes in the case, and the probe vanes align with the probe holes in the case.
- (b) Compressor case front with single probe access (B925023, B925024, B925032 and B925036) (Ref. Fig.516A). Assemble 66 vanes (2-170), 2 bolted probe vanes (2-190) and 4 bolted vanes (2-180) to the groove in the position shown in Fig.516A. Ensure that the bolted vanes align with the bolt holes in the case, and the probe vanes align with the probe holes in the case.
- (3) Apply lubricant 'C' to the 8 bolts (2-110), then secure each of the four bolted vanes with two sleeves (2-120) and bolts (2-110). Torque-tighten the bolts to 100 lbf in. (11,5 N.m), then wire-lock the bolts of each vane to one another.
- (4) Check that the probe vanes are correctly positioned by inserting the probe pin gauge (Tool 289) through the case and the holes in the vanes at the positions shown in Fig.516 and 516A.
- (5) Using feeler gauges, check the clearance between stage 4 vanes and the spacer ring. Check each vane by (lightly) pulling the vane forward (upwards) to take up the play, then inserting the feeler at the mid position of the vane tip. Turn the HP drive shaft 90 deg and recheck each stator vane. Repeat the check with the shaft turned two further 90 deg turns. Ensure the minimum tip clearance is in accordance with the Fits and Clearance Schedule 72-33-00 F.C.S.138.

(6) Assemble the probe mounting blocks and blanking plugs (Compressor case front with twin probe access) (Ref.Fig.516).

- (a) Apply lubricant 'C' to two bolts (2-150), then offer the probe mounting block (2-160) to the left-hand side of the case, correctly position the block (Ref.Fig.516) to align it with the probe and threaded holes, then secure the block with the two bolts. Torque-tighten the bolts to 100 lbf in. (11,5 Nm), then wire-lock each bolt to the adjacent lock hole in the block.
- (b) Apply lubricant 'A' to the blanking plug (2-140). Screw a locknut (2-130) on to the plug until the nut is at the opposite end to the nipple. Screw the plug into the mounting block and seat the nipple in the front case. Using a square drive, torque-tighten the plug to 70 lbf in. (7,9 Nm). Hold the plug stationary, and torque-tighten the locknut to 370 lbf in. (41,8 Nm). Assemble another blanking plug and locknut to the remaining hole in the mounting block and torque-tighten. Wire-lock the two plugs together.
- (c) Assemble a further mounting block and plugs to the right-hand side of the case using the procedure detailed in Para (6)(a) and (6)(b).

NOTE: If the build is not to be continued, place the wooden protector (Tool 1361) over the stator vanes.

- (7) Assemble retaining plates and blanking plugs  
(Compressor case front with single probe access)  
(Ref.Fig.516A).

- (a) Apply lubricant 'C' to a bolt (2A-124).  
Assemble a retaining plate (2A-125) to the  
probe position on the left-hand side of the  
case and secure with the bolt (2A-124).  
Assemble a sleeve (2-120) to a bolt (2-110)  
with lubricant 'C' applied and screw the bolt  
into the hole in the case above the retaining  
plate. Torque-tighten the two bolts to 100  
lbf in. (11,5 Nm). Apply lubricant 'A' to the  
blanking plug (2A-123). Screw the plug into  
the retaining plate and torque-tighten to 65  
lbf in. (7,3 Nm). Wire-lock the two bolts to  
the locking holes in the plug.

- (b) Assemble a retaining plate (2A-125) and blanking  
plug (2A-123) to the right-hand side of the case  
and secure with two bolts (2A-124 and 2-110) and  
a sleeve (2-120) using the procedure detailed in  
Para (7)(a).

NOTE: If the build is not to be continued,  
place the wooden protector (Tool  
1361) over the stator vane.

- R. Assemble the Stage 4 Bladed Compressor Disk and  
Stage 3-4 Spacer Ring.

NOTE: If the wooden protector is assembled, remove it  
from the stator vanes.

- (1) Ensure that the front face of the disk (02/2-20)  
identified by the inward slope of the disk and blade  
platforms is uppermost.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (2) Examine the blade platforms and identify the two adjacent platforms to No.1 blade with datum marks O then chalk a datum mark on the front face of the disk in line with the bolt hole between the datum marks.
- (3) Assemble a retainer strap (Tool 1166) to consecutive groups of six or seven blades, so that every blade has been strapped to a series of blades, then remove the blade retainer from the blade tips. Remove the masking tape (if assembled) from the blade roots rear (bottom) face and ensure that the face of the disk and blade roots/tangs are perfectly clean.

NOTE: The retainer straps prevent the blades from dropping out of the disk when it is raised.

- (4) Assemble the multiple leg sling (Tool 404) to the stage 4 disk (Ref. Fig.513).
  - (a) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.
  - (b) Ensure that the three lifting clip chains are positioned in the outermost slot of each plate. Loosen the wingnut on each lifting clip, then ensuring that the three clips are evenly disposed around the disk, locate each clip under a blade.
  - (c) Position the keep plate (of each lifting clip) over the top of a blade, and ensuring that the keep and lifting clips are abutting the blades, secure each clip with its wingnut.
- (5) Position the heater (Tool 757), heating coils uppermost, on its mobile stand (Tool 759). Position the shield (Tool 1922) (Ref.Fig.513) on the heater then raise the hoist and position the disk above the heater, lower the disk to rest on the shield. With Ref. to para.J (9) for the operation of the heater, set the time controller to 9 min and heat the disk to 60 deg C.
- (6) On completion of the heating cycle, hoist the disk and position and lower it over the LP drive shaft and above the assembly pins assembled to the spacer ring. Insert an alignment rod (Tool 1955) through the datum hole of the disk (Ref. para.(2)) and insert it into the marked assembly pin in the datum hole of the spacer ring. Insert an alignment rod through each

SUB-ASSEMBLY

**72-33-00**

Page 550

Apr 1/76

OLYMPUS 593

MK.610-14-28

OVERHAUL

hole in the disk and into the assembly pin aligned underneath. Lower the disk, and using the alignment rods, guide the disk over the assembly pins until the disk abuts the spacer. Ensure that the blades are in the fully forward/upward position, otherwise the blades will contact the outside dia of the spacer preventing the disk from abutting the spacer.

- (7) Release and remove the sling from the blades, then remove the sling from the hoist. Withdraw the alignment rods from the assembly pins, and the retainer straps from the blades.
- (8) Pull up on the assembly pins until all the thread and a small waisted portion of the bolts are visible, then clip a retaining clip (Tool 1038) onto the waisted portion of each bolt as it is pulled up. Ensure that the clips extend towards the centre of the disk. If a bolt does not pull up sufficiently, apply a light upward pull on the assembly pin, then turn the pin to align the bolthead with the spacer (ensuring that the pin is not unscrewed from the bolt). If any of the bolts are too tight to pull up with the assembly pins, proceed as follows:

- (a) Screw the mechanical driver (Tool 1064) onto a pin (Ref. Fig.514), then insert the appropriate locating key (Tool 1066 or 1079) onto the assembly pin locating the key into the slot in the bolt.

NOTE: Use locating key (Tool 1066) with assembly pins (Tool 1065), and locating key (Tool 1079) with assembly pins (Tool 1067).

- (b) Lock the locating key by screwing the thumbnut onto the assembly pin. Turn the key handle until it points towards the centre of the disk to align a flat in the bolthead with the spacer.
- (c) Screw down on the driver tommy bars and draw the bolt up until it abuts the spacer ring.
- (d) Release and remove the locating key and driver, clip a retaining clip onto the waisted portion of the bolt, then remove the assembly pin.
- (e) Repeat the procedure on any bolt that is tight.

NOTE: If all the bolts are tight, then the disk has not been heated sufficiently and must be removed and reheated. Do not attempt to draw all the bolts up using the mechanical driver.

SUB-ASSEMBLY

72-33-00

Page 551

Apr 1/76

**OLYMPUS 593**  
MK.610-14-28  
OVERHAUL

NOTE: If the assembly of the disk to the spacer has been carried out without any delays, the disk will be hot enough to enable the spacer to be assembled without re-heating the disk (Ref.para. (9) and (10)). If delays have caused the disk to cool, re-heat the disk (Ref.para. (11), (c) to (e)) prior to assembling the spacer ring.

NOTE: Care must be taken to ensure that during the assembly of the spacer, the bolts protruding through the disk are not displaced from the clips and allowed to drop from the disk. If this occurs, the bolt(s) cannot be repositioned, and the disk will have to be removed from the stage 4-5 spacer (Ref.72-33-00 Disassembly).

- (9) Remove the stage 3-4 spacer ring (02/1-380) from its container (Tool 1441) and examine the front (smaller dia) internal flange edge of the spacer ring for two datum marks  $\rightarrow 00 \leftarrow$  on scalloping pointing to a flat. The hole in line with the flat is the datum hole for the front face. Offer the spacer to the stage 4 disk, positioning the front datum hole above the disk datum hole, then lower the spacer over the bolts and rest it on the retaining clips, ensuring that none of the bolts are pushed down.
- (10) Apply lubricant 'A' to nuts (02/1-370), then screw the nuts onto the bolts ensuring that the nuts do not abut the spacer preventing the removal of the clips. Withdraw the retaining clips from the bolts and lower the spacer ensuring it abuts the disk. Using the wrench (Tool 1956) torque-tighten the nuts in the following sequence: 1, 19, 28, 10, 32, 14, 23, 6, 36, 18, 27, 9, 31, 13, 21, 3, 35, 17, 26, 8, 30, 12, 25, 7, 33, 16, 24, 5, 34, 15, 22, 4, 29, 11, 20 and 2, ensuring that the nuts have a minimum locking (run-down) torque of 9.5 lbf in. (1.1 N.m). Torque-tighten the nuts (in the correct sequence) in 80 lbf in. (9.0 N.m) increments, to a final torque of 450 lbf in. (51 N.m). During the torque-tightening of the nuts should it be necessary to re-align the flats on the boltheads with the spacer use the angled key (Tool 1952).

NOTE: If the disk had cooled to the extent of preventing the spacer abutting the disk (because of the interference fit between the two), proceed as detailed in para.(11).

TN34282

OLYMPUS 593

MK.610-14-28  
OVERHAUL

(11) If on lowering the spacer onto the disk the spacer would not assemble, proceed as follows:

- (a) Assemble the retaining clips to the bolts (under the spacer) then remove the nuts from the bolts.
  - (b) Withdraw the spacer from the bolts, then check that the retaining clips are correctly clipped to the waisted portion of the bolts.
  - (c) Assemble six equi-spaced packing pieces (Tool 1950) to the bolts and retain with slave nuts. Remove the retaining clips from these bolts and tighten the nuts to ensure the stage 4 disk is correctly seated on the stage 4-5 spacer. Unscrew the nuts sufficient to allow reassembly of the retaining clips, beneath the packing pieces, to the spacer retaining bolts then assemble the clips and remove the nuts and packing pieces.
  - (d) Invert the heater (Tool 757) on its stand so that the heater handles are uppermost. Attach the shackles of the multiple leg sling (Tool 1645) to the handles of the heater then connect the sling to a hoist (Ref.Fig.509).
  - (e) Position and lower the heater over the LP drive shaft and onto the disk. With Ref. to para.J.(9) for the operation of the heater, set the time controller to 9 min and heat the disk to 60 deg C.
  - (f) On completion of the heating cycle remove the heater and place it on its stand.
  - (g) Assemble the spacer ring to the disk as detailed in para.(9) and (10).
- (12) Using feeler gauges, check the tip clearance between the stage 4 compressor blades and the HP front case. Find the longest blade, then check the minimum tip clearance of the longest blade and the case at eight equi-spaced positions. Ensure the minimum tip clearance is in accordance with the Fits and Clearance Schedule 72-33-00 F.C.S.143.

# OLYMPUS 593

MK.610-14-28

sneema

OVERHAUL

(13) Apply lubricant 'A' to the threads and fitting dia of the bolts (02/1-360), then assemble a bolt to each bolt-hole in the front flange of stage 3-4 spacer ring (from the inside of the spacer), screw an assembly pin (Tool 1065 or 1067) onto each bolt then lower the bolt to rest on the spacer. Position the bolts to align the flat on each bolthead with the step in the spacer, for ease of locating the boltheads when the bolts are pulled up into position.

(14) Examine the front flange of the spacer ring for two datum marks 00 on scalloping pointing to a flat. The hole in line with the flat is the datum hole for the front flange, and to identify the hole during the assembly of the disk, mark the assembly pin.

NOTE: If the build is not to be continued, place a wooden protector (Tool 1361) over the blades.

S. Assemble the Stage 3 Stator Vanes and Blanks to the Front Case.

NOTE: If the wooden protector is assembled, remove it from the compressor blades.

NOTE: Ensure that any repaired vanes are evenly distributed around the case and that the aggregate depth of blending does not exceed 1.600 in. (40,64 mm) (Ref.72-33-01, Repair No.2).

(1) Apply lubricant 'A' to the stage 3 vane groove.

(2) With the trailing edge (shorter length) of the vanes at the bottom, offer the vanes to the groove loading slot at the top as viewed from above, and engage them in the groove, then ease them round the groove in either direction. Assemble 70 vanes (2-80), 4 probe vanes (2-100) and 4 bolted vanes (2-90) to the groove in the positions shown on Fig.517. Ensure that the bolted vanes align with the bolt-holes in the case, and the probe vanes align with the probe holes in the case.

(3) Apply lubricant 'C' to eight bolts (2-10), then secure each of the four bolted vanes with two bolts and sleeves (2-20). Torque-tighten the bolts to 100 lbf in. (11,5 N.m), then wire-lock the bolts of each vane to one another.

*sneema*

- (4) Check that the probe vanes are correctly positioned by inserting the probe pin gauge (Tool 289) through the case and the holes in the vanes at the positions shown in Fig.517.
- (5) Using feeler gauges, check the distance between stage 3 vanes and the spacer ring. Check each vane by (lightly) pulling the vane forward (upwards) to take up the play, then inserting the feeler at the mid position of the vane tip. Turn the HP drive shaft 90 deg and re-check each stator vane. Repeat the check with the shaft turned two further 90 deg turns. Ensure the minimum tip clearance is in accordance with Fits and Clearance Schedule 72-33-00 F.C.S.139.
- (6) Apply lubricant 'C' to two bolts (2-50), then offer the probe mounting block (2-60) to the left-hand side of the case, correctly position the block (Ref. Fig.517) to align it with the probe vane and threaded holes, then secure the block with two sleeves (2-70) and bolts. Torque-tighten the bolts to 100 lbf in. (11,5 N.m), then wire-lock each bolt to the adjacent lock hole in the block.
- (7) Apply lubricant 'A' to the blanking plug (2-40). Screw a locknut (2-30) onto the plug until the nut is at the opposite end to the nipple. Screw the plug into the mounting block and seat the nipple in the front case. Using a square drive, torque-tighten the plug to 70 lbf in. (7,9 N.m). Hold the plug stationary, and torque-tighten the locknut to 370 lbf in. (41,8 N.m). Assemble another blanking plug and locknut to the remaining hole in the mounting block and torque-tighten. Wire-lock the two plugs together.
- (8) Assemble a further mounting block and plugs to the right-hand side of the case as detailed in para.(6) and (7).

NOTE: If the build is not to be continued, place the wooden protector (Tool 1362) over the stator vanes.

OLYMPUS 593

MK.610-14-28

OVERHAUL

T. Assemble the Stage 3 Bladed Compressor Disk/Stage 2-3 Spacer Ring Assembly.

NOTE: If the wooden protector is assembled, remove it from the stator vanes.

- (1) Ensure that the stage 2-3 spacer ring (02/1-330) is uppermost.
- (2) Examine the blade platforms and identify the two adjacent platforms to No.1 blade with datum marks O, then chalk a datum mark on the front face of the disk, or spacer, in line with the bolt-hole between the datum marks.
- (3) Remove the blade retainer from the blade tips. Remove the masking tape (if assembled) from the blade roots rear (bottom) face and ensure that the face of the disk and blade roots/tangs are perfectly clean.
- (4) Assemble the multiple leg sling (Tool 404) to the stage 3 disk (Ref.Fig.513).
  - (a) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.
  - (b) Ensure that the three lifting clip chains are positioned in the outermost slot of each plate. Loosen the wingnut on each lifting clip, then ensuring that the three clips are evenly dispersed around the disk, locate each clip under a blade.
  - (c) Position the keep plate (of each lifting clip) over the top of a blade, and ensuring that the keep and lifting clips are abutting the blades, secure each clip with its wingnut.
- (5) Position the heater (Tool 757), heating coils uppermost, on its mobile stand (Tool 759). Position the shield (Tool 1922) (Ref.Fig.513) on the heater then raise the hoist and position the disk above the heater, lower the disk to rest on the shield. With Ref. to para.J.(9), for the operation of the heater, set the time controller to 9 min and heat the disk to 60 deg C.

OVERHAUL

- (6) On completion of the heating cycle, hoist the disk/spacer and position and lower it over the LP drive shaft and above the assembly pins assembled to the spacer ring. Insert an alignment rod (Tool 1955) through the datum hole of the disk (Ref. para.(2)) and insert it into the marked assembly pin in the datum hole of the spacer ring. Insert an alignment rod through each hole in the disk and into the assembly pin aligned underneath. Lower the disk, and using the alignment rods, guide the disk over the assembly pins until the disk abuts the spacer. Ensure that the blades are in the fully forward (upward) position, otherwise the blades will contact the outside dia of the spacer preventing the disk from abutting the spacer.
- (7) Release and remove the sling from the blades, then remove the sling from the hoist. Withdraw the alignment rods from the assembly pins, and the retainer straps from the blades.
- (8) Pull up on the assembly pins until all the thread and a small waisted portion of the bolts are visible, then clip a retaining clip (Tool 1989) onto the waisted portion of each bolt as it is pulled up. Ensure that the clips extend outwards. If a bolt does not pull up sufficiently, apply a light upward pull on the assembly pin, then turn the pin to align the bolthead with the spacer (ensuring that the pin is not unscrewed from the bolt), and pull up on the pin. If any of the bolts are too tight to pull up with the assembly pins, proceed as follows:
  - (a) Screw the mechanical driver (Tool 1064) onto a pin (Ref.Fig.514), then insert the appropriate locating key (Tool 1066 or 1079) into the assembly pin locating the key into the slot in the bolt.

NOTE: Use locating key (Tool 1066) with assembly pins (Tool 1065), and locating key (Tool 1079) with assembly pins (Tool 1067).

- (b) Lock the locating key by screwing the thumbnut onto the assembly pin. Turn the key handle until it points towards the centre of the disk to align a flat on the bolthead with the spacer.
- (c) Screw down on the driver tommy bars and draw the bolt up until it abuts the spacer ring.
- (d) Release and remove the locating key and driver, clip a retaining clip onto the waisted portion of the bolt, then remove the assembly pin.
- (e) Repeat the procedure on any bolt that is tight.

NOTE: If all the bolts are tight, then the disk/spacer has not been heated sufficiently and must be removed and reheated. Do not attempt to draw all the bolts up using the mechanical driver.

- (9) Apply lubricant 'A' to nuts (02/1-320), then screw the nuts onto the bolts ensuring that the nuts do not prevent the removal of the clips. Withdraw the retaining clips from the bolts. Using the wrench (Tool 1956) torque-tighten the nuts in the following sequence 1, 19, 28, 10, 32, 14, 23, 6, 36, 18, 27, 9, 31, 13, 21, 3, 35, 17, 26, 8, 30, 12, 25, 7, 33, 16, 24, 5, 34, 15, 22, 4, 29, 11, 20 and 2, ensuring that the nuts have a minimum locking (run-down) torque of 9.5 lbf in. (1.1 N.m). Torque-tighten the nuts (in the correct sequence) in 80 lbf in. (9.0 N.m) increments, to a final torque of 450 lbf in. (51 N.m). During the torque-tightening of the nuts should it be necessary to re-align the flats on the boltheads with the spacer use the angled key (Tool 1952).
- (10) On engines to SB.72-8896-347 standard, apply heat resisting aluminium touch-up enamel (PL82) to the stage 3 disk and the stage 2-3 spacer ring on the areas not protected by Sermetel W (Ref. Fig.517A). For procedure, refer to 72-09-04 Repair.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (11) Using feeler gauges, check the tip clearance between the stage 3 compressor blades and the HP front case. Find the longest blade, then check the minimum tip clearance of the longest blade and the case at eight equi-spaced positions. Ensure the minimum tip clearance is in accordance with the Fits and Clearance Schedule 72-33-00 F.C.S.142.
- (12) Apply lubricant 'A' to the threads and fitting dia of the bolts (02/1-310), then assemble a bolt to each bolt-hole in the front flange of stage 2-3 spacer ring (from the inside of the spacer), screw an assembly pin (Tool 1065) onto each bolt and lower the bolts to rest on the spacer. Position the bolts to align a flat on each bolthead with the step in the spacer, for ease of locating the boltheads when the bolts are pulled up into position.
- (13) Examine the side of the spacer ring for a datum mark  $\emptyset$  (Ref. para.(2)), and the hole in line with mark is the datum hole for the front flange. To identify the hole during the assembly of the disk, mark the assembly pin.

NOTE: If the build is not to be continued, place a wooden protector (Tool 1362) over the blades.

- U. Assemble the Stage 2 Stator Vanes and Blanks to the Front Case (Ref.SB.72-104).

NOTE: If the wooden protector is assembled, remove it from the compressor blades.

NOTE : Ensure that any repaired vanes are evenly distributed around the case and that the aggregate depth of blending does not exceed 1.920 in. (48,77 mm) (Ref.72-33-01, Repair No.2).

- (1) Remove the stage 2 stator inner fixing ring assembly (1-360/370) from its container (Tool 1441) and ensure that the three labyrinth retainer plates (1-340) are assembled and secured (Ref.72-33-01 Assembly). With the labyrinth extending forwards (upwards) and the retaining nuts on top, lower the ring over the LP drive shaft, and taking care not to damage the labyrinths, ease the ring over the stage 2-3 spacer ring labyrinth and rest the inner ring on the stage 3 disk/blades.

- (2) Turn the inner ring (as necessary), to align the loading slot with the loading slot at the left-hand side of the front case (as viewed from above).
- (3) Apply lubricant 'A' to the stage 2 vane groove in the front case, and to the vane groove in the inner ring.
- (4) With the trailing edge (shorter length) of a vane (1-470) at the bottom, offer the vane to the case at an angle with the vane outer platform lower than its inner platform. Locate the outer platform into its loading slot, lower the inner platform by pivoting the vane about its outer platform, then raise the inner fixing ring and locate the vane in the loading slot. Ease the vane along the groove in the case and inner ring (in either direction), easing the ring up/down to allow the vane to move to the position opposite the loading slots. Assemble 68 vanes (1-470), 4 probe vanes (1-490), 5 bolted vanes (1-480) and 1 bolted loading slot vane (1-460) to the grooves in the positions shown on Fig.518. During the assembly of the first few vanes, it will be necessary to support and/or move the ring (slightly) up/down, and also to turn the inner ring to ensure the loading slots remain aligned. Ensure that the bolted vanes align with the bolt-holes in the case, and the probe vanes align with the probe holes in the case.
- (5) Examine the two bolts (1-320) at the inner ring loading slot position, and ensure that the bolt retaining rings (1-300) are located in the bolt grooves. If a ring has been displaced, pull the bolt up (locating the flat on its head against the inner ring), and refit the ring in its groove. Assemble the stator vane retainer (1-310) to the two bolts. Apply lubricant 'C' to the two nuts (1-290), then screw the nuts onto the bolts. Ensure the nuts have a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m), torque-tighten to 100 lbf in. (11,5 N.m).
- (6) Apply lubricant 'C' to eight bolts (1-380), then secure each of the four bolted vanes with two bolts, the front (top) bolts having long sleeves (1-390) assembled, and the rear (bottom) bolts having short sleeves (1-400) assembled. Torque-tighten the bolts to 100 lbf in. (11,5 N.m), then wire-lock the bolts of each vane to one another.

- (7) Check that the probe vanes are correctly positioned, by inserting the probe pin gauge (Tool 289) through the case and the holes in the vanes at the positions shown in Fig.518.
- (8) Using feeler gauges, check the clearance between stage 2 vanes inner fixing ring and the spacer ring labyrinth. Check the clearance at eight equi-spaced positions, then turn the HP drive shaft 90 deg and recheck the clearance. Repeat the check with the shaft turned two further 90 deg turns. Ensure the minimum clearance is in accordance with the Fits and Clearance Schedule 72-33-00 F.C.S.96.
- (9) Apply lubricant 'C' to a bolt (1-440). Assemble a retaining plate (1-450) to the probe position on the left-hand side of the case and secure with the bolt (1-440). Assemble a sleeve (1-420) to a bolt (1-410) with lubricant 'C' applied and screw the bolt into the hole in the case above the retaining plate. Torque-tighten the two bolts to 100 lbf in. (11,5 N.m). Apply lubricant 'A' to the blanking plug (1-430). Screw the plug into the retaining plate, torque-tighten to 65 lbf in. (7,3 N.m), then wire-lock the two vane securing bolts to the locking holes in the plug.
- (10) Assemble a retaining plate (1-450) and blanking plug (1-430) to the right-hand side of the case and secure with two bolts (1-440 and 1-410) and a sleeve (1-420) as detailed in para.(9).

NOTE: If the build is not to be continued, place the wooden protector (Tool 1363) over the stator vanes.

V. Assemble the Stage 2 Bladed Compressor Disk and Rotor Shaft Front.

NOTE: Prior to assembly of the rotor shaft front check its compatibility with No.6, 7 and 8 labyrinths assembled to the rear of the intermediate case (Ref.72-32-00 Assembly) refer to SB.72-91.

NOTE: If the wooden protector is assembled, remove it from the stator vanes.

- (1) Ensure that the front face of the disk (02/1-300), identified by the inward slope of the disk and blade platforms is uppermost.

OVERHAUL

- (2) Examine the blade platforms and identify the two adjacent platforms to No.1 blade with datum marks O then chalk a datum mark on the front face of the disk in line with the bolt-hole between the datum marks.
- (3) Assemble the multiple leg sling (Tool 404) to the stage 2 disk (Ref. Fig.513).
  - (a) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.
  - (b) Ensure that the three lifting clip chains are positioned in number 2 slot of each plate. Loosen the wingnut on each lifting clip, then ensuring that the three clips are evenly disposed around the disk, locate each clip under a blade.
  - (c) Position the keep plate (of each lifting clip) over the top of a blade, and ensuring that the keep and lifting clips are abutting the blades, secure each clip with its wingnut. Disconnect the hoist and lower the sling onto the disk.
- (4) Invert the heater (Tool 757) so that the handles are uppermost. Attach the shackles of the multiple leg sling (Tool 1645) to the handles of the heater then connect the sling to a hoist (Ref.Fig.509). Raise the hoist and position and lower the heater over the LP drive shaft and suspend it over the stage 2-3 spacer ring (Ref. Fig.519). With Ref. to para.J.(9) for the operation of the heater, set the time controller to 9 min and heat the spacer ring to 70 deg C.
- (5) On completion of the heating cycle, hoist the heater clear of the spacer/LP drive shaft and lower it onto its stand. Release the hoist and lower the sling onto the unit.
- (6) Connect a hoist to the lifting ring of the sling, then raise the hoist and position and lower the stage 2 disk over the LP drive shaft and above the assembly pins assembled to the spacer ring. Insert an alignment rod (Tool 1955) through the datum hole of the disk (Ref. para.(2)) and insert it into the marked assembly pin in the datum hole of the spacer ring. Insert an alignment rod through each hole in the disk and into the assembly pin aligned underneath. Lower the disk, and using the alignment rods, guide the disk over the assembly pins until the disk abuts the spacer.

MK.610-14-28

OVERHAUL

- (7) Release and remove the sling from the blades, then remove the sling from the hoist. Withdraw the alignment rods from the assembly pins.

NOTE: Due to the heating of the stage 2-3 spacer ring, the assembly pins/bolts will have expanded and cannot be drawn up through the disk until they have cooled. The procedure following, details leaving the bolts lowered until the rotor shaft front is assembled, then pulling the bolts up. If preferred, the bolts can be left to cool, then pulled up through the disk (with the assembly pins), retaining clips assembled to the bolts (to hold them up), then the rotor shaft front heated and lowered over the bolts and onto the disk. Nuts assembled to the bolts, then the clips removed and the nuts tightened (Ref.Fig.520).

- (8) Remove the hand nut/spindle and clamp plate from the container (Tool 1420), then withdraw the rotor shaft front from the container and place it on a clean protected flat surface with the front (smaller diameter) end uppermost. Withdraw the protector (Tool 392) from the front labyrinths. Examine the flats on the rear flange for two datum marks → 00 ← to identify the datum hole, then chalk a datum mark on the circumference of the shaft in line with the hole.
- (9) Release and remove the steady (Tool 287) from the air transfer tube/LP drive shaft. Examine the scalloping inside the air transfer tube for datum marks → 0 pointing to a flat and check that it is offset to the left of the datum mark chalked on the stage 2 disk (as viewed from above).
- (10) Invert the heater (Tool 757) on its mobile stand (Tool 759) so that the heating coils are uppermost (Ref.Fig.509). Screw the lifting fixture (Tool 388) onto the threaded end of the rotor shaft front, then attach a hoist onto the ring of the fixture. Position and lower the rotor shaft front onto the heater, then with Ref. to para.J.(9) for the operation of the heater, set the time controller to 9 min and heat the shaft to 70 deg C.
- (11) Assemble the inner sealing ring (02/1-270) to the air transfer tube with the seal extending forwards (upwards) and the seal spigot located inside the flange of the tube (Ref.Fig.520). Turn the ring to align the bolt-holes of the ring and tube.

FN34295

SUB-ASSEMBLY

**72-33-00**

Page 568

Apr 1/76

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (12) On completion of the heating cycle, hoist the rotor shaft front and position and lower it over the LP drive shaft and above the assembly pins protruding through the disk. Align the chalked datum mark on the rotor shaft front (Ref. para. (8)) with the datum marked assembly pin. Insert an alignment rod (Tool 1955) through each hole in the rotor shaft outer flange, and into the assembly pin aligned underneath. Lower the rotor shaft, and using the alignment rods, guide the rotor shaft over the assembly pins until the rotor shaft abuts the disk. Examine the inner ring of bolt-holes to ensure that they align with the air transfer tube/inner sealing ring bolt-holes.
- (13) Release the hoist, then unscrew and remove the lifting fixture from the rotor shaft front. Withdraw the alignment rods from the assembly pins.

NOTE: Care must be taken to ensure that during the assembly of the rotor shaft front, the bolts are not allowed to drop from the rotor shaft. If it occurs, the bolt(s) cannot be re-positioned and the rotor shaft and disk will have to be removed from the stage 2-3 spacer (Ref. 72-33-00 Disassembly).

- (14) Pull up on the assembly pins until all the thread of the bolts are visible, then clip a retaining clip (Tool 1989) onto each bolt. If a bolt does not pull up sufficiently, apply a light upward pull on the assembly pin, then turn the pin to align the bolt-head with the spacer (ensuring that the pin is not unscrewed from the bolt) and pull up on the pin. If difficulty is experienced aligning the bolt-head with the spacer, insert the key (Tool 1066) into the assembly pin and engage the key in the slot in the bolt. Turn the key handle until it points to the centre of the rotor centre front, which indicates the bolt is correctly aligned with the spacer and can be pulled up. Assemble six equi-spaced packing pieces (Tool 1954) to the bolts and retain with slave nuts. Remove the retaining clips from these bolts and tighten the nuts to ensure the stage 2 disk is correctly seated on the stage 2-3 spacer. Unscrew the nuts sufficient to allow reassembly of the retaining clips, beneath the packing pieces, to the spacer retaining bolts then assemble the clips and remove the nuts and packing pieces.

NOTE: If the bolts pull up correctly, proceed as detailed in para. (16), but if difficulty is experienced in pulling the bolts up Ref. to para. (15).

SUB-ASSEMBLY

72-33-00

Page 569

Nov 1/76

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (15) If all the bolts are tight and cannot be pulled up, the disk bolt-holes may be out of alignment with the stage 2-3 spacer ring bolt-holes. Proceed as follows:
- (a) Screw the lifting fixture (Tool 388) onto the rotor shaft front, attach a hoist, and remove the rotor shaft. If the rotor shaft has cooled, and there is an interference fit between the shaft and the disk, heat the shaft using the heater (Tool 757), then withdraw the shaft with the lifting fixture.
  - (b) Screw the mechanical driver (Tool 1064) on to a pin (Ref. Fig.514), then insert the locating key (Tool 1066) into the assembly pin locating the key into the slot in the bolt.
  - (c) Lock the locating key by screwing the thumbnut onto the assembly pin, then turn the key handle until it points towards the centre of the disk, this aligns a flat on the bolthead with the spacer.
  - (d) Screw down on the driver tommy bars and draw the bolt up until it abuts the spacer ring.
  - (e) Draw another bolt up (diametrically opposite the first bolt) as detailed in para.(b), (c) and (d).
  - (f) Pull up on the assembly pins to confirm that the disk and spacer holes are aligned.
  - (g) If the rotor shaft front has lost its heat, reheat the rotor shaft (Ref.para.(10)).
  - (h) Assemble the rotor shaft front to the stage 2 disk (Ref.para.(12) onwards).
- (16) Apply lubricant 'A' to nuts (02/1-240), then screw the nuts onto the bolts. Withdraw the retaining clips from the bolts, then using the cranked ring wrench (Tool 1956) tighten the nuts in the following sequence: 1, 13, 7, 19, 4, 16, 10, 22, 2, 14, 8, 20, 5, 17, 11, 23, 3, 15, 9, 21, 6, 18, 12 and 24 ensuring that the nuts have a minimum locking (run-down) torque of 9.5 lbf in. (1.1 N.m). Torque-tighten (in the correct sequence) in 80 lbf in. (9.0 N.m) increments to a final torque of 450 lbf in. (51 N.m). During the torque-tightening of the nuts should it be necessary to re-align the flats on the boltheads with the spacer use the angled key (Tool 1952).

OVERHAUL

- (17) On engines to SB.72-8896-347 standard, apply heat resisting aluminium touch-up enamel (PL82) to the stage 2 disk on the areas not protected by Sermetel W (Ref.Fig.521A). For procedure, refer to 72-09-04 Repair.
- (18) Apply lubricant 'A' to bolts (02/1-250), then locate the bolts in the inner ring of holes in the rotor shaft front/inner sealing ring and screw them into the air transfer tube. Ensure the bolts have a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m) torque-tighten to 100 lbf in. (11,5 N.m.).
- (19) Using feeler gauges, check the tip clearance between the stage 2 compressor blades and the HP front case. Find the longest blade, then check the minimum tip clearance of the longest blade and the case at eight equi-spaced positions. Ensure the minimum tip clearance is in accordance with the Fits and Clearance Schedule 72-33-00 F.C.S.141.
- (20) Offer the steady (Tool 288) over the LP drive shaft and screw it onto the threaded end of the rotor shaft front, then assemble the labyrinth protector (Tool 392) to the rotor shaft.

NOTE: If the build is not to be continued, place a wooden protector (Tool 1364) over the blades.

- W. Assemble the Stage 1 Stator Vanes and Blanks to the Front Case (Ref.SB.72-104).

NOTE: If the wooden protector is assembled, remove it from the compressor blades.

NOTE: Ensure that any repaired vanes are evenly distributed around the case and that the aggregate depth of blending does not exceed 1.680 in. (42,67 mm) (Ref.72-33-01, Repair No.2).

- (1) Remove the stage 1 stator inner fixing ring assembly (1-80/90) from the container (Tool 1441) and ensure that the three labyrinth retainer plates (1-60) are assembled and secured (Ref.72-33-01 Assembly). With the labyrinth extending forwards (upwards) and the retaining nuts on top, lower the ring over the LP drive shaft. Taking care not to damage the labyrinths, ease the ring over the rotor shaft front labyrinth and rest the inner ring on the stage 2 disk/blades.

- (3) Apply lubricant 'A' to the stage 1 vane groove in the front case, and to the vane groove in the inner ring.
- (4) With the trailing edge (shorter length) of the vane (1-260) at the bottom, offer the vane to the case at an angle, with the vane outer platform lower than its inner platform. Locate the outer platform into its loading slot, lower the inner platform by pivoting the vane about its outer platform, then raise the inner ring and locate the vane in the loading slot. Ease the vane along the groove in the case and inner ring (in either direction), easing the ring up/down to allow the vane to move to the position opposite the loading slot. Assemble 56 vanes (1-260), 4 probe vanes (1-280), 7 bolted vanes (1-270) and 1 bolted loading slot vane (1-250) to the grooves in the positions shown in Fig.521. During the assembly of the first few vanes, it will be necessary to support and/or move the ring (slightly) up/down, and also to turn the inner ring to ensure the loading slots remain aligned. Ensure that the bolted vanes align with the bolt holes in the case, and the probe vanes align with the probe holes in the case.
- (5) Examine the two bolts (1-40) at the inner ring loading slot position, and ensure that the bolt retaining rings (1-20) are located in the bolt grooves. If a ring has been displaced, pull the bolt up (locating the flat on its head against the inner ring), and refit the ring in its groove. Assemble the stator vane retainer (1-30) to the two bolts. Apply lubricant 'C' to the two nuts (1-10), then screw the nuts onto the bolts. Ensure the nuts have a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m) torque-tighten to 100 lbf in. (11,5 N.m).
- (6) Apply lubricant 'C' to eight bolts (1-100), then secure the loading slot vane and three of the seven bolted vanes with two bolts, the front (top) bolts having long sleeves (1-110) assembled, and the rear (bottom) bolts having short sleeves (1-120) assembled (Ref.Fig.521). Torque-tighten the bolts to 100 lbf in. (11,5 N.m), then wire-lock the bolts of each vane to one another.
- (7) Check that the probe vanes are correctly positioned by inserting the probe gauge pin (Tool 289) through the case and the holes in the vanes at the positions shown on Fig.521.

SUB-ASSEMBLY

72-33-00

Page 573

OVERHAUL

- (8) Using feeler gauges, check the clearance between stage 1 vanes inner fixing ring and the rotor shaft front labyrinth. Check the clearance at eight equi-spaced positions, then turn the HP drive shaft 90 deg and recheck the clearance. Repeat the check with the shaft turned two further 90 deg turns. Ensure the minimum tip clearance is in accordance with the Fits and Clearance Schedule 72-33-00 F.C.S.89.
- (9) Apply lubricant 'C' to two bolts (1-220 and 200). Assemble a retaining plate (1-240) to the probe position on the right-hand side of the case (as viewed from above), and secure with a bolt (1-220). Assemble a sleeve (1-210) to a bolt (1-200) and screw the bolt into the hole in the case above the retaining plate. Torque-tighten the two bolts to 100 lbf in. (11,5 N.m). Screw a blanking plug (1-230) into the retaining plate, torque-tighten the plug to 65 lbf in. (7,3 N.m). Wire-lock the two securing bolts to the plug.
- (10) Apply lubricant 'C' to three bolts (1-180 and 130). Assemble the air supply block to the probe position on the left-hand side of the case (as viewed from above) and secure with two bolts (1-180). Torque-tighten the bolts to 100 lbf in. (11,5 N.m), then wire-lock the bolts to one another. Apply lubricant 'C' to bolt (1-150), then assemble the retaining plate (1-170) to the probe hole and part of the air supply block and secure with the bolt. Assemble a sleeve (1-140) to the remaining bolt (1-130) and screw the bolt into the hole above the retaining plate. Torque-tighten the two bolts to 100 lbf in. (11,5 N.m). Apply lubricant 'A' to the blanking plug (1-160). Screw the plug into the retaining plate, torque-tighten to 100 lbf in. (11,5 N.m), then wire-lock the two securing bolts to the plug.

NOTE: If the build is not to be continued, place the wooden protector (Tool 1364) over the stator blades.

## X. Assemble the Stage 1 Bladed Compressor Disk.

NOTE: If the wooden protector is assembled, remove it from the stator vanes.

- (1) Apply lubricant 'A' to the threads and fitting dia. of the bolts (02/1-200), then assemble a bolt to each bolt-hole in the front flange of the rotor shaft front

OLYMPUS 593

MK.610-14-28  
OVERHAUL

(from the inside of the shaft), screw an assembly pin (Tool 1065) onto each bolt and lower the bolts to rest on the rotor shaft. Examine the flats in the front flange of the rotor shaft (in line with the chalked datum mark) for two datum marks →OO← to identify the datum hole, then mark the top of the assembly pin in the datum hole.

- (2) Ensure that the front face of the disk (02/1-230), identified by the inward slope of the disk and blade platforms, is uppermost.
- (3) Examine the blade platforms and identify the two adjacent platforms to No.1 blade with datum marks →OO← then chalk a datum mark on the front face of the disk in line with the bolt-hole between the marks.
- (4) Assemble the multiple leg sling (Tool 404) to the stage 1 disk (Ref.Fig.513).
  - (a) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.
  - (b) Ensure that the three lifting clip chains are positioned in number 1 slot of each plate. Loosen the wingnut on each lifting clip, then ensuring that the three clips are evenly disposed around the disk, locate each clip under a blade.
  - (c) Position the keep plate (of each lifting clip) over the top of a blade, and ensuring that the keep and lifting clips are abutting the blades, secure each clip with its wingnut.
- (5) Hoist the disk and position and lower it over the LP drive shaft. Align the datum hole of the disk and rotor shaft front (Ref.para. (1) and (3)), then steadily lower the disk over the rotor shaft front until the disk is just touching the assembly pins. Ensure that all the pins are aligned with and entering into the disk bolt holes (with the marked pin aligned with the chalked datum hole of the disk), then steadily lower the disk over the pins until it abuts the rotor shaft front.
- (6) Release and remove the sling from the blades, then remove the sling from the hoist.

SUB-ASSEMBLY

**72-33-00**

Page 575

Apr 1/76

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (7) Pull up on the assembly pins until all the threads of the bolts are visible and a waisted portion evident, then clip a retaining clip (Tool 1989) into each bolt at the waisted portion. If a bolt does not pull up sufficiently, apply a light upward pull on the assembly pin, then turn the pin to align the bolthead with the spacer (ensuring that the pin is not unscrewed from the bolt), and pull up on the pin. If any of the bolts are too tight to pull up with the assembly pins, proceed as follows:
- (a) Screw the mechanical driver (Tool 1064) on to a pin (Ref.Fig.514), then insert the locating key (Tool 1066) into the assembly pin locating the key into the slot in the bolt.
  - (b) Lock the locating key by screwing the thumbnut onto the assembly pin, then turn the key handle until it points towards the centre of the disk, this aligns a flat on the bolthead with the spacer.
  - (c) Screw down on the driver tommy bars and draw the bolt up until it abuts the spacer ring.
  - (d) Release and remove the locating key and driver, clip a retaining clip onto the waisted portion of the bolt, then remove the assembly pin.
  - (e) Repeat the procedure on any bolt that is tight.
- (8) Apply lubricant 'A' to nuts (02/1-160). Assemble a nut to each of the bolts then screw the nuts onto the bolts ensuring that they do not abut the clips. On engines embodying SB.72-73 interpose a plain washer (02/1-170) between the nut and disk. Withdraw the retaining clips from the bolts then tighten the nuts in the following sequence: 1, 11, 7, 17, 4, 14, 9, 19, 3, 13, 6, 16, 10, 20, 5, 15, 2, 12, 8 and 18 ensuring that the nuts have a minimum locking (run-down) torque of 9.5 lbf in. (1.1 N.m). Torque-tighten the nuts (in the correct sequence) in 80 lbf in. (9.0 N.m) increments, to a final torque of 450 lbf in. (51 N.m). During the torque-tightening of the nuts should it be necessary to re-align the flats on the boltheads with the rotor shaft front use the angled key (Tool 1952). After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 2.5 thread pitches beyond nut chamfer, the bolt must be renewed (Ref.SB.72-8446-172).
- (9) Using feeler gauges, check the tip clearance between the stage 1 compressor blades and the HP front case. Find the longest blade, then check the

minimum tip clearance of the longest blade and the case at eight equi-spaced positions. Ensure the minimum tip clearance is in accordance with the Fits and Clearance Schedule 72-33-00 F.C.S.140.

- (10) Place the wooden protector (Tool 1364) over the blades.
- Y. Determine the Thickness of the HP Rotor Shaft Front Adjusting Washer (Ref.Fig.522).
- (1) Ensure that the set gap between the stage 7 compressor disk and the rear flange of the HP rear case is still correct (Ref. para.K.(12)).
- (a) Release and remove the access covers from the rear bearing adapter.
- (b) Check that the setting gauge (Tool 57) can just be inserted between each of the three internal bosses in the adapter and the rear (bottom) outer blade platforms of the disk.
- (c) If the clearance is incorrect, release the lock ring and adjust on the mechanical jack (Tool 1029) to give the dimension of the block (2.3070 - 2.3075 in.) (58,59 mm).
- (d) Replace and secure the access covers to the rear bearing adapter.
- (2) Remove the protector from the rotor shaft front. Determine the dimension between the front face of the HP front case flange and the adjusting washer abutment face of the rotor shaft front. Record as dimension 'D'. Assemble the protector (Tool 392) to the rotor shaft front.
- (3) Obtain dimension 'C' from the intermediate case (Ref. 72-32-00 Assembly) if the engine is to pre-SB.72-29, or the Set Gap dimension from the Fits and Clearances Schedule 72-33-00 F.C.S.162 if the engine incorporates SB.72-29.
- NOTE: Dimension 'C' is the distance between the intermediate outer casing rear flange, to the rear face of the oil thrower ring with (No.3) HP compressor front bearing loaded forwards.
- (4) Determine the thickness of the adjusting washer required by subtracting dimension 'D' from dimension 'C' or the Set Gap dimension. The thickness of the washer must be within the limits of 0.249 to 0.345 in. (6,325 to 8,763 mm) for pre-SB.72-29 standard, or 0.237 to 0.309 in. (6,019 to 7,848 mm) for SB.72-29 standard engine.

OVERHAUL

Z. Assemble the Front Bearing Adapter to the HP Front Case and the Rotor Shaft Front (Ref.Fig.523).

- (1) Ensure that the slave bearing (Tool 1289) is assembled and secured to the front bearing adapter (Tool 1032). Offer the lifting/extracting fixture (Tool 1353) to the adapter, align the offset thumbscrew with the offset tapped hole in the adapter, then screw the thumbscrews into the adapter. Fully tighten the screws.
- (2) Ensure that the steady (Tool 288) is screwed onto the rotor shaft front, then remove the wooden protector and the protector from the rotor shaft front. Apply lubricant 'A' to bearing location on the rotor shaft front, then assemble the spacer ring (Tool 870) to the shaft (in lieu of the adjusting washer and oil thrower).
- (3) Ensure that the LP support sleeve (Tool 1030) (Ref. Fig.505) has been unscrewed one and a half turns from contact with the HP support sleeve (Tool 1031) on the bottom of the rear bearing adapter. Release the mechanical jack (Tool 1029) lockring, then screw in on the jack to raise the HP compressor (approx.) 0.125 in. (4,0 mm).

NOTE: Unless the LP support sleeve is loosened off from the jack, there is no operating clearance, and the jack cannot be operated.

- (4) Attach a hoist to the lifting/extracting fixture, then position and lower the front bearing adapter over the steady. Release the hoist, then screw the fixture onto the steady, pressing the slave bearing onto the rotor shaft front. Align the dowel hole in the front bearing adapter with the dowel in the HP front case (with the lifting eyes in the front and rear adapters aligned), then screw down on the fixture until the bearing is fully down. Release the thumbscrews securing the fixture to the front bearing adapter, then unscrew and remove the fixture. Unscrew and remove the steady from the rotor shaft front.
- (5) Locate the adapter (Tool 891) (Ref.Fig.524) on the inner race of the front bearing adapter slave bearing. Screw the extension (Tool 521) onto the hydraulic mechanical driver (Tool 900). Lower the driver over the LP drive shaft until it abuts the rotor shaft front, then screw the driver housing (LEFT-HAND thread) onto the rotor.

CAUTION: Do not overtighten.

OVERHAUL

- (6) Connect the feed pipe from a hand operated hydraulic pump to the driver connection. Operate the hand pump and apply pressure to the driver, ensure that as the piston moves down, the thrust plate locates correctly over the adapter. Apply a pressure of 7500 psig (51 700 kPa) to the driver.
- (7) Release the hydraulic pressure and check that the driver thrust plate rises (under its spring pressure). Disconnect the feed pipe from the driver, then unscrew and withdraw the driver and extension. Remove the adapter from the front bearing adapter.
- (8) Apply lubricant 'B' to the threads of the rotor shaft front, then assemble the spacer ring (Tool 988) and the 'LEFT-HAND' threaded retaining nut (72-61-00/1-10) to the rotor. Hand-tighten the nut using spanner wrench (Tool 1324) (Ref.Fig.525).
- (9) With the dowel hole in the front bearing adapter engaged in, or aligned with, the dowel in the HP front case (Ref. para.(4)), and the bolt-holes in the adapter and case aligned, lower the mechanical jack until the adapter abuts the HP case flange. Secure the adapter to the case with slave nuts and bolts. Lock the jack with its lockring.
- (10) Offer the steady (Tool 1158) to the front bearing adapter, align the bolts with the adapter holes, then screw the bolts into the adapter and fully tighten. Offer the immobilizer (Tool 387) into the steady and over the LP drive shaft, and engage it in the cutaways inside the HP rotor shaft front. Ensure that the multiplier (Tool 1022) is bolted to the spanner wrench (Tool 386), then offer the spanner/multiplier over the immobilizer. Turn the HP rotor shaft as necessary to engage the spanner pin in the cutaway in the steady and the spanner dogs in the retaining nut. Using a torquemeter wrench torque-tighten the 'LEFT-HAND' threaded retaining nut to 1250 lbf ft (1694,8 N.m) (reading of 50 lbf ft (67,8 N.m) on the wrench because of the 25 to 1 multiplier). Remove the torquemeter wrench multiplier/spanner, immobilizer and steady from the assembly.

OVERHAUL

- (11) Assemble the steady, support and immobilizer to the LP drive shaft and the front bearing adapter (Ref.Fig.526).
- (a) Offer the immobilizer (Tool 1339) into the front bearing adapter and engage the teeth in the HP drive shaft front retaining nut.
  - (b) Unscrew the knurled locknut, then withdraw the location bush towards the eye end of the steady (Tool 290). Offer the steady shaft to the LP drive shaft and slide the four lobes of the shaft through the cutaways in the drive shaft, turn the steady shaft 45 deg so that the lobes locate behind the lands of the drive shaft. Push the location bush down, locating it over the drive shaft and ensuring that its peg locates in one of the cutaways in the drive shaft. Screw on the knurled locknut and tighten it against the location bush.
  - (c) Offer the front support (Tool 292) over the steady, then withdraw the immobilizer from the (rotor drive shaft) nut, align the immobilizer pins and threaded studs with the plain holes in the front support then engage the two. Screw knurled nuts (Tool 1340) onto the protruding end of the studs until the immobilizer is held against the support.
  - (d) Push the support onto the steady and screw the support locknut onto the steady. Align the offset screw of the support with the offset tapped hole in the front bearing adapter, then screw the screws into the adapter ensuring that the support locknut is screwed fully into the steady. Release the support locknut to allow a 0.005 in. (0,127 mm) clearance between the nut and the support, then screw the steady locking nut (Tool 291) onto the end of the steady and lock it against the support locknut.
- (12) Assemble and secure protector (Tool 395) to the blow-off position at stage 3 location, and protector (Tool 394) to the vent position at stage 5 location of the compressor front case.

AA. Assemble the HP Compressor Rear (No.12) Labyrinth to the HP Drive Shaft (Ref.Fig.528).

- (1) Rotate the pit stand arms 180 deg until the rear bearing adapter is uppermost.
- (2) Unscrew and remove the LP drive shaft support sleeve (Tool 1030) from the HP drive shaft (Ref.Fig.505), then release the mechanical jack (Tool 1029) locking and unscrew the jack a turn. Unscrew the jack captive bolts, then remove the jack. Withdraw the HP drive shaft support sleeve (Tool 1031) from the HP drive shaft.
- (3) Separate the two halves of the split sleeve (Tool 1058), offer the sleeves to the LP drive shaft and locate the ends in the HP drive shaft, then secure the two halves together (Ref.Fig.527). Unscrew and remove the guide sleeve (Tool 377) from the LP drive shaft, then screw the lifting fixture (Tool 1055) onto the end of the shaft.
- (4) Attach a hoist to the lifting plate of the fixture, then remove the five nuts and washers securing each rear bearing adapter extension to each pit stand arm (Ref.Fig.504). Steadily raise the hoist until the arm locating pins are clear, then traverse the hoist and guide the assembly out sideways from the pit stand, and position it over the mobile stand (Tool 1036). Ensure that the stand clamps are clear, align the lifting eye and attachment nuts in the adapter with the cutaways in the stand, then lower the assembly onto the stand and secure with the stand clamps. Release the hoist and unscrew and remove the lifting fixture.
- (5) Offer the multiple leg sling (Tool 1054) (Ref.Fig.527) over the LP and HP drive shaft and align its captive bolts with the tapped holes in the rear (top) flange of the rear bearing adapter. Screw the bolts into the adapter and fully tighten the bolts. Release and remove the slave nuts and bolts securing the rear bearing adapter to the HP rear case. Withdraw the three rear bearing adapter rollers from the HP drive shaft (Ref.Fig.506), by releasing the smaller knurled lock-rings (on the outside of the adapter) and turning the larger rings clockwise.

- (6) Attach a hoist to the ring of the sling then steadily raise the adapter until clear of the LP drive shaft. Position and lower the adapter onto a suitable pallet.

NOTE: Prior to the assembly of bolts (02/3-240) to the rear labyrinth they are to be paired with their nuts (02/3-230) and a locking (run-down) torque check carried out. On engines to Pre SB.72-8775-295 standard, the bolts must be new (zero lifed).

- (7) Apply lubricant C to the threads of bolts (02/3-240) and screw onto each bolt a nut (02/3-230). Check the locking (run-down) torque of each nut Ref.72-09-00 Assembly. For engines pre SB 72-8923-363, the minimum locking torque is 10 lbf in. (1,1 N.m). For engines to SB 72-8923-363 standard, the minimum locking torque is 3.5 lbf in. (0,4 Nm). On completion of the locking torque checks, number both nuts and bolts in pairs.
- (8) Examine the labyrinth (02/3-300) in between the two rear (smaller dia) labyrinth fins for the datum marks 00 then chalk a datum mark on the rear face. Assemble the eight numbered D-headed bolts (02/3-240) to the front (larger) flange holes, lock the bolt flats against the labyrinth and assemble a clip (of the retaining clip assembly Tool 977 or 1149) onto the protruding waisted portion of each bolt. Place the labyrinth in the container (Tool 755) and pack with a freezing agent, then assemble the lid and leave for approx. 40 min.
- (9) On engines to Pre SB.72-8305-154 Part 1 standard, assemble the eight bolts (02/3-220A) to the rear (smaller) No.12 labyrinth flange on the HP drive shaft.

NOTE: Use only bolts that are new (zero lifed).

- (a) Apply lubricant 'A' to the bolt thread and offer the bolt, so that it extends rearwards (upward) into one of the eight bolt-holes. Locate the assembly sleeve (Tool 1321) over the thread of the bolt.

OVERHAUL

- (b) Press a retaining ring (02/3-210) over the end of the assembly sleeve and ease it onto the bolt. Remove the assembly sleeve and press the ring into the groove in the bolt.
  - (c) Assemble the remaining seven bolts and retaining rings in the same manner.
- (10) On engines embodying SB.72-8305-154 Part 1 assemble the eight bolts (02/3-220B) to the rear (smaller) No.12 labyrinth flange on the HP drive shaft.

**NOTE:** On engines to Pre SB.72-8775-295 standard use only bolts that are new (zero lifed), and to verify correct D-head assembly they must be marked at their tip with a capital letter 'T' (the cross of the T parallel with the D flat) (Ref.Fig.528 Detail B). Use either the vibro percussion engraving or electro-chemical method of marking; for procedure refer to (72-09-00 Repair).

- (a) Apply lubricant 'A' to the bolt thread and offer the bolt, so that it extends rearwards (upward) into one of the eight bolt-holes.
- (b) Ensure the flat on the head is located against the shaft and retain the bolt in the assembled position with a retaining clip (Tool 1999), ensure the body of the clip lies against the shaft.
- (c) Assemble and secure the remaining seven bolts in the same manner.

OLYMPUS 593

MK.610-14-28

OVERHAUL

## (11) Assemble the labyrinth (Ref.Fig.528).

- (a) Using protective gloves, remove the labyrinth from the container at the completion of its cooling period, and apply lubricant 'A' to the bolt threads.
- (b) On engines to SB 72-8923-363 standard, apply lubricant 'E' to the rear face of eight sealing plates (02/3-232). Avoid excessive use of lubricant, and use protective gloves. Assemble the plates into the bolt-holes in the front (lower) labyrinth mounting flange of the drive shaft.
- (c) Offer the labyrinth over the drive shaft, align the chalked datum mark on the labyrinth with the datum hole chalked on the drive shaft, then lower the labyrinth and locate the clipped bolts in the drive shaft flange. Screw a nut (02/3-230) onto each of the front (lower) clipped bolts, and remove the clips (Tool 977).
- (d) On engines Pre SB 72-8305-154 Part 1 standard, assemble a flat washer (02/3-200), keywasher (02/3-190) and nut (02/3-180A) to each of the rear (top) bolts. Lower the labyrinth, ensuring that it abuts the drive shaft. Torque-tighten the nuts to 100 lbf in. (11,5 Nm) and lock the nuts with the keywashers.
- (e) On engines to SB 72-8305-154 Part 1 standard, assemble a nut (02/3-180B) to each of the rear (top) bolts. Remove the retaining clips (Tool 1999), and lower the labyrinth, ensuring that it abuts the drive shaft. Check that the nuts have a locking torque of 10 lbf in. (1,1 Nm) and torque-tighten to 100 lbf in. (11,5 Nm).

**NOTE:** Ensure that the front (lower) bolts are seated correctly by checking the position of the letter T (bolt flat indication) on the tip of the bolts before tightening. (Ref.Fig.528).

- (f) Using the cranked ring wrench (Tool 1543 Pre SB 72-8923-363 or Tool 3141 SB 72-8923-363 standard), torque-tighten the front (lower) ring of nuts to 100 lbf in. (11,5 Nm). Check, using a mirror, the amount of bolt stand-out (Ref. 72-09-00 Assembly) on each nut to ensure that the bolts are seated correctly.

- (12) Attach a hoist to the ring of the rear bearing adapter sling, then raise the adapter and position it over the LP drive shaft. Insert the balancing machine drive belt (Tool ) (length 106 in. (2692,4 mm) width 3 in. (76,2 mm)) into the large cutaway in the adapter, and ensure that when the adapter is lowered, the belt is guided around the HP drive shaft. Steadily lower the adapter over the HP drive shaft and guide the adapter slave bearing over the inner race on the shaft. Align the locating pin in the HP rear case with the pin hole in the adapter flange, and ensure the bolt-holes in each item align. Secure the adapter to the rear case with slave nuts and bolts. Release and remove the sling from the rear bearing adapter and the hoist.
- (13) Offer the spacer ring (Tool 414) with its flanged end to the rear (uppermost), over the LP and HP drive shaft and rest it on the bearing inner race. Apply lubricant 'B' to the slave retaining nut (Tool 418), then screw it into the HP shaft. Tighten the nut with the hand spanner wrench (Tool 410).

NOTE: The H.P. compressor assembly is now ready for concentricity, swash checks and balancing.

3. Prepare and Check the HP Compressor Assembly for Concentricity and Swash

A. Assemble the HP Compressor Assembly to the Surface Table (Ref.Fig.531).

- (1) Prepare the surface table equipment for checking the concentricity.
- (a) Position two supports (Tool 1073) on the surface table.
- (b) Assemble a spacer (Tool 1074) to one support, and spacer (Tool 1075) to the remaining support. Assemble clamp plates to each support to secure the spacers.

OVERHAUL

- (c) Position the jack (Tool 1059) on the surface table.

NOTE: In order to assemble the HP compressor assembly to the surface table, the assembly must be turned to the horizontal position. Two methods are possible, and the choice is left to the operator and/or the availability of equipment. The first method is detailed in para.(2) to (4), and the second method is detailed in para.(5) to (7).

- (2) Screw the lifting fixture (Tool 1055) onto the end of the LP drive shaft, then attach a hoist to the fixture. Release the mobile stand clamps, then raise the hoist and position the assembly alongside the pit stand (Tool 1027). Ensure that the arms of the stand extend upwards, and that the rear bearing adapter flange is positioned above the locating pins of the arms. Traverse the hoist and guide the cases in between the stand arms until the rear bearing adapter extensions are positioned above the stand arms. Lower the adapter and guide the two locating pins and the five studs of each adapter extension, into the holes in each stand arm. Assemble a washer and nut to each of the studs, then fully tighten the nuts. Release and remove the lifting fixture from the LP drive shaft and the hoist.
- (3) Rotate the pit stand arms 90 deg with the lifting eyes on the front and rear bearing adapters uppermost (Ref.Fig.529). Attach a hoist to the roller of the beam type sling (Tool 1056), then raise the hoist and position the beam over the HP compressor assembly. Ensure that the strop is shackled to the upper hole in the end plate, then attach the single leg sling (Tool 1394) to the bracket at the other end of the beam with a shackle. Remove the shackles from the bottom of the strop and single leg sling, then attach the strop/sling to the rear bearing adapter eye, and the front bearing adapter plate with the shackles. Position the beam lifting roller to the beam mid position, or as marked on the beam.

OVERHAUL

- (4) Raise the hoist to tension the strop/sling, then unscrew and remove the nuts and washers securing the adapter to the pit stand arms. Adjust the position of the beam lifting roller to support the assembly in the horizontal position. Traverse the hoist to disengage the adapter from the locating pins of the arms. Raise the hoist taking care to guide the assembly out of the stand, then position the assembly over the surface table.

NOTE: Refer to para.(8) and assemble the compressor assembly to the surface table.

- (5) Screw the lifting fixture (Tool 1055) onto the end of the LP drive shaft, then attach a hoist to the fixture. Release the mobile stand clamps, then raise the hoist and position the assembly over the front support (Tool 1076) (Ref.Fig.530). Release the two locking bars of the support, then steadily lower the assembly engaging the lugs of the support (Tool 292) in the recesses of the front support. Secure the support with the locking bars of the front support. Moving the hoist as necessary, lower the rear end of the assembly, pivoting about the support, and rest the recessed part of the rear bearing adapter on the rear support (Tool 1306), ensuring that the lifting eye and plate of the adapters are uppermost.

CAUTION: ENSURE THAT THE LIFTING FIXTURE  
(TOOL 1055) PLATE PIVOTS AS THE  
ASSEMBLY IS LOWERED.

- (6) Remove the hoist then unscrew and remove the lifting fixture from the LP drive shaft. Attach a hoist to the roller of the beam type sling (Tool 1056), then raise the hoist and position the beam over the HP compressor assembly. Ensure that the strop is shackled to the upper hole in the end plate, then attach the single leg sling (Tool 1394) to the bracket at the other end of the beam with a shackle. Remove the shackles from the bottom of the strop and single leg sling, then attach the strop/sling to the rear bearing adapter eye, and the front bearing adapter plate with the shackles. Position the beam lifting roller to the beam mid position, or as marked on the beam.

- (2) Allow the assembly to rotate long enough to eliminate the effects of differential temperature on the readings obtained, then calibrate the machine and continue to rotate the assembly until the change in the mean average readings of unbalance at F and Rc over a period of three minutes are less than 2 drin in.

NOTE: 1 drin in. = 45 g mm.

- (3) Calibration checks.
- (a) The application of 4 drms of plasticine to the HP drive shaft 9 in. (228,6 mm) rearward of Rc should register approximately 9 drin in. at F and 33 drin in. at Rc 180 deg from the reading at F.
  - (b) Rotating the spacer ring (Tool 414) through 180 deg should not affect balance at Rc by more than 2 drin in.
- (4) Should the initial unbalance readings be within the following limits, at F 220 drin in. and at Rc 250 drin in. continue with the balance of the assembly ref. para.(6).
- (5) With the unbalance readings outside the initial limits, rectify in accordance with the following procedures.
- (a) Record the angle and amount of unbalance.
  - (b) Remove the HP compressor from the balancing machine and reassemble to the pit stand, ref. para.4.D.
  - (c) Disassemble the HP compressor in accordance with 72-33-00 Disassembly, to the area causing the unbalance.
  - (d) Inspect for excessive or inadequate clearances between components, burrs or unbalance in individual components. Rectify the defect, then reassemble the HP compressor in accordance with the appropriate text in this chapter.
  - (e) Remove the assembly from the pit stand and assemble to the surface table, ref. para.3.A.
  - (f) Carry out swash and concentricity checks, ref. para.3.B.

SUB-ASSEMBLY

**72-33-00**

Page 598.9

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (g) On completion of satisfactory swash and concentricity checks, remove the HP compressor from the surface table and reassemble it to the balancing machine for dynamic balance.
- (6) With the unbalance readings within the initial limits, balance the assembly within 8 drn in. by the following procedures in accordance with the SB. standard to which the compressor is built.
- (a) On engines to Pre SB.72-8305 Part 2 standard, correct the unbalance at F by the addition of balance washers beneath the nuts securing the first stage rotor disk. On engines embodying SB.72-73 remove the plain washers (02/1-170) from the bolts to which balancing washers are fitted. Maximum number of washers that can be used for balancing purposes are, 2 off (02/1-180), 2 off (02/1-185) and 5 off (02/1-190). Torque-tighten nuts, after assembling washers, to 450 lbf in. (9,5 N.m).
- (b) On engines embodying SB.72-8305 Part 2, correct the unbalance at F by applying a temporary correction i.e., plasticine to the disk at the balancing weight diameter (Ref.Fig.534).
- (c) On engines to Pre SB.72-8305 Part 1, correct the unbalance at Rc by the addition of keywashers (02/3-290) and balancing bolts (02/3-250 to 280) to a maximum of 32 off from the range of balancing bolts provided. Apply lubricant 'A' to the threads of the balancing bolts and torque-tighten to 100 lbf in. (11,5 N.m). Lock the bolts with the keywashers.

**NOTE:** On engines to Pre SB.72-8775-295 standard, the balancing bolts provided must be new (zero lifed).

MK.610-14-28

OVERHAUL

- (d) Turn the rotor to position the datum line at the top vertical position, then position and lock the dial gauge scale to (zero) '0'.
- (e) Turn the rotor in a clockwise direction as viewed from the rear, and record the swash or eccentricity at eight equi-spaced angular positions. Ensure that when the rotor returns to its starting point, the gauge returns to '0'. If the gauge doesn't return to '0', check the equipment to ensure there is no looseness and that the gauge is locked, then recheck until a satisfactory result is achieved.
- (f) When swash checks entail the dial gauge pointer passing over blade roots, care must be taken to ensure that the gauge setting is not altered.
- (g) On completion of the checks replace and secure the panels, and assemble the split sleeves (Tool 1058) to the LP and HP drive shafts.

(2) Check and record the amount of swash and eccentricity as detailed in para.(1) at the following positions.

- (a) The eccentricity at the rear land of the rear (No.12) labyrinth (position Y2).
- (b) The eccentricity at the mid position of the HP drive shaft (position Y3).
- (c) The eccentricity at the rear end of the HP drive shaft (position Y4).
- (d) The swash of the stage 7 disk at the blade root location (position V2).
- (e) The swash at the rear land of the rear (No.12) labyrinth (location V3).
- (f) The swash of the stage 1 disk at the blade root (position V1).
- (g) The eccentricity of the stage 1 disk at the blade platform lip (position Y1).
- (h) The concentricity at position Z1 and Z2 as follows:
  - (i) Remove the rear bolt and spacer from the bolted vane at the top of the compressor case at the stage 3 vane location.

SUB-ASSEMBLY

**72-33-00**

MK.610-14-28  
OVERHAUL

sneema

- (ii) Remove the checking gauge (Tool 1) from its container (Tool 90) and slide the probe out of the sleeve. Ensure that a slave washer is assembled to the sleeve, then screw the sleeve into the hole in the case and fully tighten the sleeve.
  - (iii) Insert the probe into the sleeve, then insert the dial gauge indicator into the sleeve and secure it in the sleeve with the wing screw, ensuring that the gauge is in its mid travel position.
  - (iv) Check the amount of eccentricity at stage 3-4 spacer ring (position Z1) as detailed in para.(1), (c) to (e).
  - (v) Release and remove the dial gauge indicator, then unscrew and remove the gauge sleeve and washer. Stow the gauge in its container. With the sleeve (2-20) assembled to the bolt (2-10) screw the bolt into the case with lubricant 'C' applied to bolt threads. Then torque-tighten the bolt to 100 lbf in. (11,5 N.m). Wire-lock the bolt to the other stator vane securing bolt.
  - (vi) Check the amount of eccentricity at stage 4-5 spacer ring (position Z2) by removing the rear bolt (2-110) and sleeve (2-120) from the bolted vane at the left-hand side of the compressor case at the stage 4 vane location. Using the check gauge (Tool 2) follow the procedure as detailed in para. (ii) to (v).
- (3) The total indicator reading (T.I.R.) of swash at positions V1, V2 and V3 must not exceed 0.005 in. (0,127 mm), and the T.I.R. of eccentricity at positions Y1, Y2, Y3, Z1 and Z2 should not exceed 0.004 in. (0,102 mm). If the swash and/or eccentricity are in excess of the figures quoted, determine from the amount of swash and/or eccentricity at the positions checked, and the angular and longitudinal relationships, the area of the rotor that is causing the malalignment and producing the excessive swash and/or eccentricity. The HP compressor assembly must be removed from the surface table, assembled to the stand and disassembled (Ref.72-33-00 Disassembly) to the area causing the defect. The items in the area

SUB-ASSEMBLY

## 72-33-00

OVERHAUL

inspected to determine the defect, then the defect rectified and the HP compressor reassembled in accordance with the appropriate text in this Chapter. Repeat the swash and concentricity checks, and, if necessary, rectify until satisfactory figures within the limits are obtained.

#### 4. Prepare and Balance the H.P. Compressor Assembly

##### A. Prepare the Balancing Machine (Avery 72 N 56) (Ref.Fig.533).

- (1) Assemble a spacer (Tool 1075) to the left-hand and centre cradles of the machine, and spacer (Tool 1074) to the right-hand cradle. Assemble clamp plates to each cradle to secure the spacers.

NOTE: If the availability of equipment entails using the spacers used for swash/concentricity, remove the HP compressor from the surface table and place on the support stands (Ref.para.B.(1)), then release and remove the spacers from the surface table supports and assemble the spacers to the balancing machine.

- (2) Assemble the adjustable support (Tool 1090) to the spacer in the left-hand cradle so that the hinged bridge piece opens away from the operator. Assemble clamp plates to the spacer to secure the support, then open the bridge piece. Ensure that the three support pads are withdrawn.

##### B. Assemble the HP Compressor Assembly to the Balancing Machine.

NOTE: If the availability of the balancing machine entails a delay before the HP compressor is balanced, but the surface table is required for other use, or the position or availability of equipment prevents the HP compressor from being assembled direct to the machine, the HP compressor can be assembled to the mobile stand or support stands.

SUB-ASSEMBLY

**72-33-00**

Page 598.3

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (1) Attach a hoist to the roller of the beam type sling (Tool 1056) (Ref.Fig.530), then raise the hoist and position the beam over the HP compressor. Ensure that the strop is shackled to the upper hole in the end plate, and the single leg sling (Tool 1394) is shackled to the bracket at the other end of the beam. Remove the shackles from the bottom of the strop and single leg sling, then attach the strop/sling to the rear bearing adapter eye, and the front bearing adapter plate with the shackles. Position the beam lifting roller to the beam mid position, or as marked on the beam.

NOTE: If the HP compressor is to be assembled direct to the balancing machine proceed as detailed in para.(6) onwards. If, however, the HP compressor is not to be assembled to the machine direct, assemble the HP compressor to the mobile or support stands as follows.

- (2) Raise the hoist and adjust the position of the beam lifting roller (if necessary) to support the assembly in the horizontal position. Position the assembly over the front support (Tool 1076) and rear support (Tool 1306) (Ref.Fig.530), then lower the assembly engaging the front bearing support lugs in the front support and the recessed part of the rear bearing adapter on the rear support. If the assembly has to remain on the support stands for a period, or has to be assembled to the mobile stand, release the beam type sling and lower it to the floor.

NOTE: When the assembly is required for assembling to the balancing machine, remove it from the supports and assemble it to the machine as detailed in para.(5) onwards.

NOTE: If the assembly requires transporting in the mobile stand, assemble it to the stand as detailed in para.(3).

OVERHAUL

- (3) Close and secure the front support locking bars, then screw the lifting fixture (Tool 1055) onto the end of the LP drive shaft and attach a hoist to the fixture. Moving the hoist as necessary, raise the rear end of the assembly, pivoting about the front support, until the assembly is vertical. Release the front support locking bars, then raise the hoist and position it over the mobile stand (Tool 1036). Ensure that the stand clamps are clear, align the lifting eye and attachment nuts of the adapter with the stand cut-aways, then lower the assembly onto the stand. Secure the adapter to the stand with the stand clamps. Release the hoist.

NOTE: When the assembly is required for assembling to the balancing machine, remove it from the mobile stand and assemble it to the machine as detailed in para.(4) onwards.

- (4) Attach a hoist to the lifting fixture, then release the mobile stand clamps and raise the hoist and position the assembly over the front support (Tool 1076). Lower the assembly engaging the lugs of the front bearing support in the front support, then close and secure the front support locking bars. Moving the hoist as necessary, lower the rear end of the assembly, pivoting about the support, and rest the recessed part of the rear bearing adapter on the rear support (Tool 1306), ensuring that the lifting eye and plate of the adapters are uppermost. Release the hoist, then unscrew and remove the lifting fixture from the LP drive shaft.

CAUTION: ENSURE THAT THE LIFTING FIXTURE (TOOL 1055) PLATE PIVOTS AS THE ASSEMBLY IS LOWERED.

- (5) Attach a hoist to the roller of the beam type sling (Tool 1056) then raise the hoist and position the beam over the HP compressor. Ensure that the strop is shackled to the upper hole in the end plate, and the single leg sling (Tool 1394) is shackled to the bracket at the other end of the beam. With the shackles remove from the bottom of the strop and single leg sling, attach the strop/sling to the rear bearing adapter eye, and the front bearing adapter plate with the shackles. Position the beam lifting roller to the beam mid position, or as marked on the beam.

MK.610-14-28

OVERHAUL

- (6) Raise the hoist and adjust the position of the beam lifting roller (if necessary) to support the assembly in the horizontal position. Position the assembly over the balancing machine with the front bearing adapter at the right-hand side. Position the balancing machine cradles to align with the recessed portion in each adapter and the plain portion of the LP drive shaft, then lock the cradles. Steadily lower the assembly and guide the adapter recesses onto the cradle spacers (Ref. Fig.533). Close and secure the bridge piece, then adjust in on the three support pads until they abut the LP drive shaft. Lock the support pads with their locknuts.
- (7) Align the balancing machine motor and rollers with the belt protruding from the cutaway of the rear bearing adapter, assemble the belt to the motor/rollers and adjust as necessary to operate correctly, then secure the motor/rollers.
- (8) Assemble the belt guard supports (Tool 1988) to the bed of the balancing machine. Position and secure the belt guards and supports so that the belt is centrally placed within the guards. Ensure that the belt does not foul the guard.
- (9) Attach a strip of black adhesive tape around the HP drive shaft, clear of the belt, but within the area of the cutaway in the rear bearing adapter. Mark this adhesive tape with a white spot in line with the datum hole of the drive shaft and use the spot as the datum for balancing.
- (10) Release and remove the split sleeves from the LP drive shaft.
- (11) Prepare the balancing machine for balancing in accordance with the manufacturers instructions, setting up the pick-ups, nodel bar, pick-up wires and scanning head etc.

C. Balance the HP Compressor Rotor (Ref.Fig.534).

- (1) Start the balancing machine and run the assembly up to balancing speed in accordance with the manufacturer's instructions.

OVERHAUL

- (2) Allow the assembly to rotate long enough to eliminate the effects of differential temperature on the readings obtained, then calibrate the machine and continue to rotate the assembly until the change in the mean average readings of unbalance at F and Rc over a period of three minutes are less than 2 drm in.

NOTE: 1 drm in. = 45 g mm.

- (3) Calibration checks.

(a) The application of 4 drms of plasticine to the HP drive shaft 9 in. (228,6 mm) rearward of Rc should register approximately 9 drm in. at F and 33 drm in. at Rc 180 deg from the reading at F.

(b) Rotating the spacer ring (Tool 414) through 180 deg should not affect balance at Rc by more than 2 drm in.

- (4) Should the initial unbalance readings be within the following limits, at F 220 drm in. and at Rc 250 drm in. continue with the balance of the assembly ref. para.(6).

- (5) With the unbalance readings outside the initial limits, rectify in accordance with the following procedures.

(a) Record the angle and amount of unbalance.

(b) Remove the HP compressor from the balancing machine and reassemble to the pit stand, ref. para.4.D.

(c) Disassemble the HP compressor in accordance with 72-33-00 Disassembly, to the area causing the unbalance.

(d) Inspect for excessive or inadequate clearances between components, burrs or unbalance in individual components. Rectify the defect, then reassemble the HP compressor in accordance with the appropriate text in this chapter.

(e) Remove the assembly from the pit stand and assemble to the surface table, ref. para.3.A.

(f) Carry out swash and concentricity checks, ref. para.3.B.

SUB-ASSEMBLY

**72-33-00**

Page 598.9

Jun 1/77

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (g) On completion of satisfactory swash and concentricity checks, remove the HP compressor from the surface table and reassemble it to the balancing machine for dynamic balance.
- (6) With the unbalance readings within the initial limits, balance the assembly within 8 drn in. by the following procedures in accordance with the SB. standard to which the compressor is built.
- (a) On engines to Pre SB.72-8305 Part 2 standard, correct the unbalance at F by the addition of balance washers beneath the nuts securing the first stage rotor disk. On engines embodying SB.72-73 remove the plain washers (02/1-170) from the bolts to which balancing washers are fitted. Maximum number of washers that can be used for balancing purposes are, 2 off (02/1-180), 2 off (02/1-185) and 5 off (02/1-190). Torque-tighten nuts, after assembling washers, to 450 lbf in. (9,5 N.m).
- (b) On engines embodying SB.72-8305 Part 2, correct the unbalance at F by applying a temporary correction i.e., plasticine to the disk at the balancing weight diameter (Ref.Fig.534).
- (c) On engines to Pre SB.72-8305 Part 1, correct the unbalance at Rc by the addition of keywashers (02/3-290) and balancing bolts (02/3-250 to 280) to a maximum of 32 off from the range of balancing bolts provided. Apply lubricant 'A' to the threads of the balancing bolts and torque-tighten to 100 lbf in. (11,5 N.m). Lock the bolts with the keywashers.

NOTE: The balancing bolts provided must be new (zero lifed).

TN21101

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (d) On engines embodying SB.72-8305 Part 1, correct the unbalance at Rc by the addition of balancing weights (O2/3-183 to 187) to the labyrinth rear flange securing bolts. Use a maximum of eight weights in any combination from the weights provided.

CAUTION: ONE BALANCING WEIGHT MUST BE ASSEMBLED AT RC TO FACILITATE VENTING.

- (e) Ensure the nuts have a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m) and torque-tighten to 100 lbf in. (11,5 N.m).

NOTE: Check that the D headed bolts are assembled correctly. The cross of the letter 'T' marked on the tip of the bolt denotes the position of the bolt flat (Ref.Fig.534 detail Rc).

- (7) After balancing the assembly, measure the unbalance at F and T2. Should the unbalance at F exceed 12 drn in. or at T2 6 drn in., reduce the amount of unbalance at F to 6 drn in. by rebalancing the assembly in accordance with para.(6). Recheck the unbalance at F and T2, and, if necessary, rebalance until satisfactory.
- (8) Record the angle and weights of washers, bolts or weights used to achieve balance at F and Rc.

OVERHAUL

D. Remove the HP Compressor Assembly from the Balancing Machine.

- (1) Offer the two halves of the split sleeve (Tool 1058) to the LP drive shaft and locate the ends in the HP drive shaft, then secure the two halves together. Release and hinge open the bridge piece of the adjustable support.
- (2) Release and position the belt guards and supports clear of the belt, then release and remove the drive belt from the motor and rollers, and secure the belt clear of the machine to prevent possible fouling. Remove the black adhesive tape from the HP drive shaft.
- (3) Attach a hoist to the roller of the beam type sling (Tool 1056), then raise the hoist and position the beam over the HP compressor (Ref.Fig.529). Ensure that the strop is shackled to the upper hole in the end plate, and the single leg sling (Tool 1394) is shackled to the bracket at the other end of the beam. Attach the strop/sling to the rear bearing adapter eye and the front bearing adapter plate with the shackles. Position the beam lifting roller to the beam mid position, or as marked on the beam.

NOTE: If the availability of the pit stand or its position prevents the HP compressor from being assembled direct (by hoist) into the stand (Ref.para.(4) and (5)), assemble it to the mobile stand as detailed in para.B, (2) and (3), then assemble it to the pit stand.

PRINTED IN ENGLAND

OVERHAUL

- (4) Release and remove the clamp plates from the spacers. Raise the hoist and adjust the position of the beam lifting roller (if necessary) to support the assembly in the horizontal position. Steadily raise the hoist until the HP compressor is clear of the machine, then position it above the pit stand (Tool 1027) (Ref.Fig.529). Position the pit stand arms so that the locating pins/studs are at 90 deg to the vertical, then lower the compressor into the stand so that the front face of the rear bearing adapter flange faces the pins/studs and is level with them. Traverse the hoist and engage the pins/studs into the extensions of the adapter flange, then assemble and fully tighten a washer and nut to each of the studs.
- (5) Release and remove the beam type sling from the adapters, then lower the beam onto a suitable container and release the hoist. Rotate the pit stand arms 90 deg to position the rear bearing adapter lowermost.

NOTE: The HP compressor is now ready for final balance of the compressor and HP turbine assembly Pre SB.72-8305-154 Part 2 (Ref.Para.5, 6, 7 and 8) or on engines embodying SB.72-8305-154 Part 2, the final balance of the compressor with a turbine simulator (Ref.Para.9 and 10).

5. Assemble the HP Turbine Assembly to the HP Compressor Assembly (Pre SB.72-8305-154 Part 2 Standard)

NOTE: The HP turbine assembly will be received from the assembly/balancing section having been balanced as separate items, with the items marked with the alignment datum marks. The turbine wheel will be bladed with the blades correctly locked, and the hub unit (72-51-04/1-300) will have the front labyrinth (72-51-04/1-250) assembled to it, whilst the rear labyrinth will be loose. The labyrinths, hub and blade tips will have protectors assembled.

A. Prepare the HP Compressor Assembly.

- (1) Release and remove the three knurled nuts from the front support (Tool 292) (Ref.Fig.535) releasing the immobilizer (Tool 1339), then push the three studs of the immobilizer to engage the immobilizer in the teeth of the HP drive shaft front retaining nut, turning the rotor (slightly) to achieve engagement. Screw three knurled headed bolts (Tool 1341) into the three tapped holes in the front support to secure the immobilizer in engagement with the retaining nut.

MK.610-14-28  
OVERHAUL

- (2) Turn the stand arms 180 deg to position the rear bearing adapter uppermost. Release and remove the split sleeves (Tool 1058) from the LP and HP drive shafts. Release and remove the retaining nut from the HP drive shaft using the hand spanner wrench (Tool 410), then withdraw the spacer ring (Tool 414) from the shaft.

B. Assemble the HP Turbine Assembly.

- (1) Slide a slave adjusting washer (72-51-04/1-35) over the LP and HP drive shafts and rest it on the bearing. Slide the HP front labyrinth and hub assembly over the LP drive shaft, align the master serration of the hub and the HP drive shaft, then engage the two. Assemble the keywasher (72-51-04/1-30), plain washer (72-51-04/1-20) and round nut (72-51-04/1-10) to the HP drive shaft (Ref.Fig.535).
- (2) Locate the adapter (Tool 1315) on the dowels of the immobilizer (Tool 1343) then secure the adapter to the immobilizer with five cap screws (of the immobilizer). Locate the multiplier (Tool 1022) on the end of the immobilizer, align the holes of both items, then secure them together with eight cap screws (of the immobilizer).
- (3) Slide the spanner wrench (Tool 1085) over the LP drive shaft and engage it in the hub nut. Attach a hoist to the handle of the immobilizer, then raise the hoist and position and lower it over the LP drive shaft. Turn the drive of the multiplier as necessary to engage its square drive in the spanner, and the adapter serrations on those of the hub. Unscrew and remove the lifting ring from the side of the immobilizer. Ensuring that the painted instructions on the arm are uppermost lower the torque loading arm (Tool 1342) over the immobilizer and locate the clearance holes over the pillars.

TN25609

# OLYMPUS 593

MK.610-14-28  
OVERHAUL

SNECMA

- (4) Unscrew the three knurled headed bolts (Tool 1341) located in the front support, allowing the immobilizer to drop and release the rotor. Turn the rotor to align the datum bolt hole in the labyrinth hub with the cutaway in the rear bearing adapter. Examine the heads of the turbine bolts (72-51-04/1-180) for the position numbers, then insert No.1 bolt through the labyrinth/hub, adapter, immobilizer and arm and secure with a slave nut lubricated with lubricant 'C'. Insert the remaining nine bolts in numerical sequence in a clockwise direction (as viewed from the rear), by turning the rotor to align the holes with the cutaway, and secure with slave nuts.

NOTE: If the protector on the hub prevents the insertion of the turbine bolts, release and remove the protector.

- (5) Turn the stand arms 90 deg to position the HP compressor horizontal in its correct attitude. Looking from the rear of the assembly turn the arm so that it is horizontal, with the painted instruction dealing with the spring balance on the right-hand side. Engage the immobilizer (Tool 1339) in the HP drive shaft front retaining nut and secure with the three knurled headed bolts (Tool 1341). Fully tighten the turbine bolt nuts.
- (6) Attach a spring balance (capable of a load of 200 lb. (90,7 kg)) to a hoist, then attach the balance to the shackle on the right-hand end of the arm. Hook the weights carrier (Tool 1344) to the shackle at the left-hand end of the arm, then add the five weights (Tool 1345) (totalling 170 lb.) to the carrier, ensuring that as the weights are added, an equal load is applied by the hoist, until the total weight of 170 lb. (77,11 kg) on one end of the arm, is equalled by a load of 170 lb. (77,11 kg) on the scale at the other end of the arm. Using a torque-meter wrench and multiplier, torque-tighten the retaining nut between 3000 and 3300 lbf ft (4067,0 and 4474,0 N.m) (reading of 120 to 130 lbf ft (162,7 and 176,2 N.m) on the wrench because of the 25 to 1 multiplier). Remove the wrench, then remove the weights and reduce the load on the spring balance an equivalent amount,

OVERHAUL

until all the weights are removed and the spring balance reads zero. Disconnect the spring balance from the arm and hoist, and the weight carrier from the other end of the arm.

NOTE: Do not peen the keywasher.

- (7) Turn the stand arms 90 deg to position the rear bearing adapter uppermost. Release the turbine bolt nuts, then unscrew the three knurled headed bolts (Tool 1341) located in the front support, allowing the immobilizer to drop and release the rotor. Turning the rotor as necessary to align the turbine bolts with the rear bearing adapter cutaway, release and remove the turbine bolts. Remove the torque-loading arm from the immobilizer, then screw the lifting ring into the side of the immobilizer. Attach a hoist to the handle of the immobilizer, then raise the hoist and position and lower the immobilizer onto a suitable container. Release the hoist from the immobilizer. Remove the spanner wrench from the hub nut.
- (8) Assemble the lifting fixture (Tool 1120) to the HP turbine unit (Ref.Fig.536).
  - (a) Ensure that the thumbnuts are loose and the tommy bars of the claws point to the 'UNLOCK' position.
  - (b) Attach a hoist to the lifting ring of the fixture, then position and lower the fixture into the centre of the turbine wheel, ensuring that the rear of the turbine is uppermost as denoted by the blade locking plates. Turn the tommy bars of the claws to the 'LOCK' position, then lock the claws with the thumbnuts.
- (9) Determine the datum hole of the hub by examining the face of the outside circumference in line with a Hirth serration for a datum mark→O. This mark will be in line with a datum mark→O on the rear face of the front labyrinth. Then determine the datum hole in the turbine wheel by examining the outer face of the bolt bosses on the rear (uppermost) face of the wheel for a datum mark→O. Note the position of the datum hole in each item.

- (10) Raise the hoist and position and lower the turbine wheel over the LP drive shaft. Align the datum holes, then lower the wheel onto the hub engaging the Hirth serrations. Release the thumbnuts of the lifting fixture, then turn the tommy bars to the 'UNLOCK' position. Raise the hoist, then position and lower the fixture onto a suitable container and disconnect the hoist.
- (11) Examine the rear labyrinth (72-51-04/1-160) rear face, inboard of the attachment bolt holes, for a datum mark 0 indicating the datum hole. Offer the rear labyrinth over the LP drive shaft, align the datum holes of the labyrinth and turbine wheel, then rest the labyrinth on the wheel. Turn the rotor to align the datum bolt hole in the labyrinth/hub with the cutaway in the rear bearing adapter. Examine the heads of the turbine bolts (72-51-04/1-180) for the position numbers, then insert No.1 bolt through the labyrinth/hub, turbine wheel and rear labyrinth and secure with a self-locking nut (72-51-04/1-120) lubricated with lubricant 'C'. Insert the remaining nine bolts in numerical sequence in a clockwise direction (as viewed from the rear) by turning the rotor to align the bolt holes with the cutaway, and secure the bolts with the nuts, having lubricated them with lubricant 'C'.
- (12) Engage the immobilizer (Tool 1339) in the HP drive shaft front retaining nut and secure by screwing in the three knurled headed bolts. Tighten the turbine wheel nuts in the following sequence 1, 6, 3, 8, 2, 7, 4, 9, 5 and 10 in progressive increments to a final torque between 80 and 90 lbf ft (108,5 and 122,0 N.m).
- (13) Assemble the split sleeve (Tool 393) to the LP drive shaft and HP turbine rear labyrinth. Ensure that the protector (Tool 1062) is assembled to the hub labyrinth, and the protectors (Tool 1061, 1063 and 1126) are assembled to the turbine front and rear labyrinths and the turbine blades.

NOTE: The HP compressor and turbine assembly is now ready for balancing.

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

6. Prepare and Balance the HP Compressor and Turbine Assembly

A. Prepare the Balancing Machine (Avery 72N 56) (Ref.Fig.537).

- (1) Assemble a spacer (Tool 1075) to the left-hand and centre cradles of the machine, and spacer (Tool 1074) to the right-hand cradle. Assemble clamp plates to each cradle to secure the spacers.
- (2) Assemble the adjustable support (Tool 1090) to the spacer in the left-hand cradle so that the hinged bridge piece opens away from the operator. Assemble clamp plates to the spacer to secure the support, then open the bridge piece. Ensure that the three support pads are withdrawn.
- (3) Assemble and (temporarily) secure two brackets (Tool 1291) to the bed of the machine in between the left-hand and centre cradles. Position the bottom half of the turbine guard (Tool 1303) on the two brackets, then locate the bracket/guard securing studs in the slots in the guard brackets and secure with washers and nuts.

B. Assemble the HP Compressor and Turbine Assembly to the Balancing Machine.

NOTE: If the availability of the balancing machine entails a delay before the HP compressor is balanced, but the pit stand is required for other use, the HP compressor can be assembled to the support stands (Ref.para.(3)) or mobile stand (Ref.para.(4)).

- (1) Rotate the pit stand arms 90 deg with the lifting eyes on the front and rear adapters uppermost. Attach a hoist to the roller of the beam type sling (Tool 1056), then raise the hoist and position the beam over the HP compressor assembly (Ref.Fig.529). Ensure that the strop is shackled to the upper hole in the end plate, and the single leg sling (Tool 1394) is shackled to the bracket at the other end of the beam. Attach the strop/sling to the rear bearing adapter eye and the front bearing adapter plate with the shackles. Position the beam lifting roller towards the turbine wheel end of the beam, or as marked on the beam.

OVERHAUL

- (2) Raise the hoist to tension the strop/sling, then unscrew and remove the nuts and washers securing the adapter to the pit stand arms. Adjust the position of the beam lifting roller to support the assembly in the horizontal position. Traverse the hoist to disengage the adapter from the locating pins of the arms, then raise the hoist taking care to guide the assembly out of the stand.

NOTE: If the HP compressor is to be assembled direct to the balancing machine proceed as detailed in para.(7) onwards. If, however, the HP compressor is not to be assembled to the machine direct, assemble the HP compressor to the support stands or mobile stand (Ref. para. (3) and (4)).

- (3) Position the assembly over the front support (Tool 1076) and rear support (Tool 1306) (Ref. Fig. 530), then lower the assembly engaging the front bearing support lugs in the front support and the recessed part of the rear bearing adapter in the rear support. If the assembly has to remain on the support stands for a period, or has to be assembled to the mobile stand, release the beam type sling and lower it to the floor.

NOTE: When the assembly is required for assembling to the balancing machine, remove it from the supports and assemble it to the machine as detailed in para. (6) onwards.

NOTE: If the assembly requires transporting in the mobile stand, assemble it to the stand as detailed in para. (4).

- (4) Close and secure the front support locking bars, then screw the lifting fixture (Tool 1055) onto the end of the LP drive shaft and attach a hoist to the fixture. Moving the hoist as necessary, raise the rear end of the assembly, pivoting about the front support, until the assembly is vertical. Release the front support locking bars, then raise the hoist and position it over the mobile stand (Tool 1036). Ensure that the stand clamps are clear, align the lifting eye and attachment nuts of the adapter with the stand cut-aways, then lower the assembly onto the stand. Secure the adapter to the stand with the stand clamps. Release the hoist.

NOTE: When the assembly is required for assembling to the balancing machine, remove it from the mobile stand and assemble it to the machine as detailed in para. (5) onwards.

OVERHAUL

- (5) Attach a hoist to the lifting fixture, then release the mobile stand clamps and raise the hoist and position the assembly over the front support (Tool 1076). Lower the assembly engaging the lugs of the front bearing support in the front support, then close and secure the front support locking bars. Moving the hoist as necessary, lower the rear end of the assembly, pivoting about the support, and rest the recessed part of the rear bearing adapter on the rear support (Tool 1306), ensuring that the lifting eye and plate of the adapters are uppermost. Release the hoist, then unscrew and remove the lifting fixture from the LP drive shaft.

CAUTION: ENSURE THAT THE LIFTING FIXTURE (TOOL 1055) PLATE PIVOTS AS THE ASSEMBLY IS LOWERED.

- (6) Attach a hoist to the roller of the beam type sling (Tool 1056), then raise the hoist and position the beam over the HP compressor. Ensure that the strop is shackled to the upper hole in the end plate, and the single leg sling (Tool 1394) is shackled to the bracket at the other end of the beam. With the shackles removed from the bottom of the strop and single leg sling, attach the strop/sling to the rear bearing adapter eye, and the front bearing adapter plate with the shackles. Position the beam lifting roller towards the turbine wheel end of the beam, or as marked on the beam. Raise the hoist and adjust the position of the beam lifting roller (if necessary) to support the assembly in the horizontal position.
- (7) Position the assembly over the balancing machine with the front bearing adapter at the right-hand side. Position the balancing machine cradles to align with the recessed portion in each adapter and the plain portion of the LP drive shaft, then lock the cradles. Release the guard brackets, then position the guard and brackets to align with the turbine wheel. Secure the brackets and guard. Release and remove the protectors from the turbine wheel, hub and labyrinths. Steadily lower the assembly and guide the adapter recesses onto the cradle spacers (Ref.Fig.537), then assemble clamp plates to each spacer to secure the adapters. Close and secure the bridge piece, then adjust in on the three support pads until they abut the LP drive shaft. Lock the support pads with their locknuts.

OVERHAUL

- (8) Align the balancing machine motor and rollers with the belt protruding from the cutaway of the rear bearing adapter, assemble the belt to the motor/rollers and adjust as necessary to operate correctly, then secure the motor/rollers.
- (9) Assemble the belt guard supports (Tool 1988) to the bed of the balancing machine. Position and secure the belt guards and supports so that the belt is centrally placed within the guards. Ensure that the belt does not foul the guard.
- (10) Attach a strip of black adhesive tape around the HP drive shaft, clear of the belt, but within the area of the cutaway in the rear bearing adapter. Mark the adhesive tape with a white spot in line with the datum hole of the drive shaft (chalked on the shaft) and use the spot as the datum for balancing.
- (11) Assemble a tie bar (Tool 1292) to the front face of the left-hand and centre cradle of the balancing machine, and secure with four bolts or Allen screws, then secure a tie bar (Tool 1293) to the rear face of the left-hand and centre cradle.
- (12) Release and remove the split sleeves from the LP drive shaft and the beam type sling from the adapters. Lower the beam onto a suitable container and release the hoist.

NOTE: It is recommended that the beam type sling is painted to indicate the position the lifting beam roller should be in with the HP turbine assembled.

- (13) Prepare the balancing machine for balancing in accordance with the manufacturers instructions, setting up the pick-ups, nodal bar, pick-up wires and scanning head etc.

C. Balance the HP compressor Rotor and Turbine Assembly (Ref.Fig.538).

- (1) Start the balancing machine and run the assembly up to balancing speed in accordance with the manufacturers instructions.

OVERHAUL

- (2) Allow the assembly to rotate long enough to eliminate the effects of differential temperature on the readings obtained, then calibrate the machine and continue to rotate the assembly until the change in the mean average readings of unbalance at F and T3 over a period of three minutes are less than 2 drin in.

NOTE: 1 drin in. = 45 g mm.

- (3) Record the change of unbalance at F and the initial unbalance at T3.
- (4) The change of unbalance at F must not exceed 20 drin in. from that recorded during the balance of the HP compressor rotor (Ref. para. 4.C.), and the maximum initial unbalance at T3 must not exceed 190 drin in. Should both readings be within the limits quoted, continue to balance the assembly (Ref. para. (6)). Should the readings be outside the limits, rectify as detailed in para. (5).
- (5) Readings outside the limits.
- (a) Record the angle and amount of unbalance at F and T3.

- (b) Carry out a swash check on the HP turbine wheel (Ref. para. 7) and determine if the swash TIR is in excess of 0.005 in. (0,127 mm).

NOTE: Swash in excess of 0.005 in. (0,127 mm) indicates malalignment of items, and the angular position of excess unbalance and swash should correspond.

- (c) Rectify excess unbalance and swash as follows:

- (i) Transfer the HP compressor and turbine assembly to the pit stand (Ref. para. 7.D.).

- (ii) Remove the HP turbine assembly from the HP drive shaft (Ref. para. 8) and examine all items, including the rear bearing inner track, for damage or loose particles. Pay particular attention to the Hirth serrations.

- (iii) If no apparent cause of malalignment is evident, the HP turbine bladed disk, labyrinth and hub must be checked for balance, swash and dimensions as detailed in 72-51-03 Assembly.

SUB-ASSEMBLY

sneema

- (d) On completion of checks and /or rectification, re-assemble the HP turbine assembly to the HP compressor (Ref.para.5.), then re-balance the complete assembly (Ref.para.6.).

(6) Readings within the limits.

- (a) The following procedures are those required to balance the assembly at F and T3 to within 6 drn in.

NOTE: Apply lubricant 'A' to bolt threads before assembly of nuts.

- (b) Reduce unbalance by adding at T3 balancing weights (72-51-04/1-200) maximum of 8 off (72-51-04/1-205, 210, 215) maximum of 4 off each and (72-51-04/1-220) maximum of 8 off, retained by self-locking nuts (72-51-04/1-190) maximum of 10 off. Ensure the nuts have a minimum locking (run-down) torque of 6.5 lbf in. (0,73 N.m) torque-tighten to 210 lbf in. (24 N.m).

NOTE: Self-locking nuts are not to be fitted without balancing weights.

- (c) Reduce unbalance by adding at U balancing weights (02/3-140) use a maximum of 3 off each for all the weights provided and retain each weight with self-locking nuts (02/3-130) and bolts (02/3-170) with lubricant 'A' applied. Use a maximum of 5 off each. Ensure the nuts have a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m) torque-tighten to 100 lbf in. (11,5 N.m).

- (d) Record the angular position and weights used at T3 and U.

D. Remove the HP Compressor and Turbine Assembly from the Balancing Machine.

- (1) Remove the top half of the guard (if fitted) from around the turbine disk, then assemble the split sleeves (Tool 393) to the LP drive shaft and HP turbine rear labyrinth. Release and hinge open the bridge piece of the adjustable support.

SUB-ASSEMBLY

72-33-00

Page 598.26

Dec 31/01

MK.610-14-28  
OVERHAUL

- (2) Release and position the belt guards and supports clear of the belt, then release and remove the drive belt from the motor and rollers, and secure the belt clear of the machine to prevent possible fouling. Remove the black adhesive tape from the HP drive shaft.
- (3) Attach a hoist to the roller of the beam type sling (Tool 1056) (Ref.Fig.529), then raise the hoist and position the beam over the HP compressor. Ensure that the strop is shackled to the upper hole in the end plate, and the single leg sling (Tool 1394) is shackled to the bracket at the other end of the beam. Attach the strop/sling to the rear bearing adapter eye and the front bearing adapter plate with the shackles. Position the beam lifting roller towards the turbine wheel end of the beam, or as marked on the beam.
- (4) Release and remove the clamp plates from the spacers. Raise the hoist and adjust the position of the beam lifting roller (if necessary) to support the assembly in the horizontal position. Steadily raise the hoist until the HP compressor is clear of the machine.

NOTE: If the availability of the pit stand or its position prevents the HP compressor from being assembled direct by hoist into the stand (Ref.para.(5) and (6)), assemble it to the support stands or mobile stand as detailed in para.B, (3) and (4), then when possible, assemble it to the pit stand (Ref.para.B.(5) and (6) and D.(5) and (6)).

NOTE: If initial unbalance of the HP turbine is outside acceptable limits and swash checks are required, assemble the HP compressor to the surface table and carry out swash checks as detailed in para.7.

- (5) Position the HP compressor and turbine assembly above the pit stand (Tool 1027). Position the pit stand arms so that the locating pins/studs are at 90 deg to the vertical, then lower the compressor into the stand so that the front face of the rear bearing adapter flange faces the pins/studs and is level with them. Traverse the hoist and engage the pins/studs into the extensions of the adapter flange, then assembly and fully tighten a washer and nut to each of the studs.

- (6) Release and remove the beam type sling from the adapters, then lower the beam onto a suitable container and release the hoist. Rotate the pit stand arms 90 deg to position the rear bearing adapter uppermost. Assemble the protectors (Tool 1061, 1062, 1063 and 1126) to the turbine wheel, hub and labyrinths.

#### 7. Prepare and Check the Swash of the HP Turbine Assembly

NOTE: Swash checks on the HP turbine are only required to help assess the cause of unbalance outside acceptable limits (Ref.para.6.C.(5)).

- A. Prepare the Surface Table Equipment for Checking the Swash (Ref.Fig.539).

NOTE: If the equipment was left on the surface table following the concentricity and swash check on the HP compressor (Ref.para.3.A.), para.(1) to (3) will not be required.

- (1) Position two supports (Tool 1073) on the surface table.
- (2) Assemble a spacer (Tool 1074) to one support, and spacer (Tool 1075) to the remaining support. Assemble clamp plates to each support to secure the spacers.

NOTE: If the availability of equipment entails using the spacers used for balancing, remove the HP compressor from the machine and place on the support stands (Ref.para.6.D.), then release and remove the spacers from the balancing machine and assemble the spacers to the surface table supports.

- (3) Position the jack (Tool 1059) on the surface table.

- B. Assemble the HP Compressor and Turbine Assembly to the Surface Table.

- (1) Position the HP compressor and turbine assembly over the surface table.
- (2) Ensure that the supports on the surface table are aligned with the recessed portion in each adapter, and that the supports are secured to the surface table.
- (3) With the front bearing adapter located over the spacer (Tool 1074), lower the assembly and guide the adapter recesses onto the spacers, then assemble clamp plates to each spacer to secure the adapters.

- (4) Release and remove the beam type sling from the adapters, then lower the beam onto a suitable container and release the hoist.
- (5) Position the jack (Tool 1059) under the LP drive shaft, at a plain portion of the shaft, then adjust in on the three support pads until they abut the shaft. Release and remove the split sleeves (Tool 393) from the LP drive shaft and turbine labyrinth.
- C. Check the Swash of the HP Turbine Assembly (Ref.Fig.540).
- (1) The checks on both the front and rear face entail the use of two dial gauges. Readings on each face are taken simultaneously at the left and right-hand sides of the disk.
- NOTE: Before carrying out swash checks it is recommended that both front and rear faces of the turbine disk are chalked up as in Fig.540, using the disk datum as zero.
- (2) Swash at rear face, position W.
- (a) With both dial gauges set to zero, and each positioned at its own disk zero rotate the disk counter-clockwise, looking from the rear, and record both dial readings at each of the eight angular positions. Ensure that on returning to the start position both gauges again read zero.
- (b) For each gauge add the two largest readings to record the maximum T.I.R. and angle.
- (c) Total swash for rear face is recorded as the mean average of T.I.R. readings from left and right-hand gauges and at the mean average of both angles.
- (3) Swash at front face, position V4, repeat the procedure described for position W.

D. Remove the HP Compressor and Turbine Assembly from the Surface Table.

- (1) Assemble the split sleeves (Tool 393) to the LP drive shaft and turbine labyrinth, then release the three support pads of the jack (Tool 1059) from the LP drive shaft.
- (2) Attach a hoist to the roller of the beam type sling (Tool 1056), then raise the hoist and position the beam over the HP compressor (Ref.Fig.530). Ensure that the strop is shackled to the upper hole in the end plate, and the single leg sling (Tool 1394) is shackled to the bracket at the other end of the beam. Remove the shackles from the bottom of the strop and single leg sling, then attach the strop/sling to the rear bearing adapter eye, and the front bearing adapter plate with the shackles. Position the beam lifting roller to the beam mid position, or as marked on the beam.
- (3) Raise the hoist and adjust the position of the beam lifting roller (if necessary) to support the assembly in the horizontal position. Position the HP compressor and turbine assembly over the pit stand (Tool 1027), then attach the assembly to the stand as detailed in para.6.D.(5) and (6).

8. Remove the HP Turbine Assembly from the HP Compressor Assembly

A. Remove the Rear Labyrinth from the HP Turbine Disk (Ref. Fig.541).

- (1) Release and remove the protector (Tool 1062) from the hub labyrinth then unscrew and remove the 10 nuts securing the labyrinth to the turbine disk and lower the bolts onto the rear bearing adapter flange. Release and remove the split steady (Tool 393) from the labyrinth and the LP drive shaft.
- (2) Ensure that the tommy bars of the mechanical puller (Tool 1247) are turned to 'FREE' and the thrust bolts are unscrewed.
- (3) Offer the puller over the LP drive shaft and guide the claws through the air holes in the labyrinth. Turn the claw tommy bars to 'LOCK', then screw in on the three thrust bolts until they contact the disk. Screw the thrust bolts in, in equal increments, until the labyrinth is released.

- (4) Withdraw the labyrinth/puller over the LP drive shaft and place them on a clean flat surface. Turn the claw tommy bars to 'FREE' and remove the puller from the labyrinth.

B. Remove the HP Turbine Disk from the Hub/Labyrinth Unit (Ref. Fig.536 and 542).

- (1) Ensure that the lifting fixture (Tool 1120) thumbnuts are undone, that the claws are pushed out and the claw tommy bars point to 'UNLOCK'.
- (2) Attach a hoist to the lifting fixture, then lower the fixture over the LP drive shaft and guide the bottom locating ring into the centre hole of the disk, until the top locating ring abuts the disk.
- (3) Turn the tommy bars to 'LOCK' adjusting their position as required to locate them under the disk, then tighten the thumbnuts to lock the claws.
- (4) Steadily raise the turbine disk until clear of the LP drive shaft, then position and lower it onto a suitable pallet (Ref. para.5) or onto its mobile stand (Tool 1111) (Ref.Fig.542) as follows.
  - (a) Ensure that the mandrel (Tool 139) is assembled to a bearing of the mobile stand, with the mandrel secured in the vertical position and the Hirth serrations of the mandrel disk uppermost. Screw the lifting fixture (Tool 1113) into the (top) end of the mandrel.
  - (b) Position the disk over the mandrel, then lower the hoist and guide the disk over the mandrel and engage the mandrel studs in the bolt holes of the disk. Screw the disk nuts onto the studs and fully tighten the nuts.
  - (c) Release the lifting fixture thumbnuts, then turn the claw tommy bars to 'UNLOCK'. Steadily raise the hoist until the fixture is clear of the mandrel, then lower the fixture onto a suitable container and remove the hoist.

- (d) Attach the hoist to the lifting fixture of the mandrel, then withdraw the plunger from the bearing. Lower the hoist, pivot the mandrel about the bearing, until the mandrel is horizontal and locate it in the other bearing. Pivot the bearing cap over the mandrel and secure the cap with its pivot bolt and thumbnut. Push in the plunger on the other bearing. Release and remove the hoist.
- (5) If the turbine disk was placed on a pallet, release the lifting fixture thumbnuts, turn the claw tommy bars to 'UNLOCK', taking the weight of the disk as required to disengage the claws from under the disk, then withdraw the fixture from the disk. Remove the fixture from the disk and place it on a suitable container.
- C. Remove the HP Turbine Front Labyrinth and Hub Assembly from the HP Drive Shaft.
- (1) Ensure that the adapter (Tool 1315) is located and secured to the plate of the immobilizer (Tool 1343) and the multiplier (Tool 1022) is secured to the handle end of the immobilizer.
- (2) Lower the spanner wrench (Tool 1085) over the LP drive shaft and locate it in the retaining nut (Ref. Fig.543). Attach a hoist to the handle of the immobilizer (Tool 1022), then lower the immobilizer over the spanner and turn the multiplier drive as necessary to engage it in the spanner and to align the immobilizer pillars with the bolts in the hub. Disconnect the hoist from the handle.
- (3) Push the bolts up through the pillars and screw slave nuts onto the bolts, fully tightening the nuts. Insert a bar into the immobilizer, then unscrew the nut.
- (4) Unscrew and remove the nuts and lower the bolts onto the adapter flange. Attach a hoist to the handle, then steadily raise the hoist until the immobilizer is clear of the spanner. Position and lower the immobilizer onto a suitable container, then disconnect the hoist. Withdraw the spanner from the LP drive shaft and place it on a suitable container.
- (5) Unscrew the hub retaining nut, then remove the nut, plain washer and keywasher from the HP drive shaft.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (6) Attach a hoist to the extractor/lifting equipment (Tool 1057), then steadily lower the extractor over the LP drive shaft until the cylinder engages in the HP drive shaft (Ref.Fig.543). Aligning the pillars with the hub bolts, turn the handle to lower the extractor until it abuts the hub. Push the hub bolts up through the pillars, then screw slave nuts onto the five bolts. Withdraw the remaining five bolts by turning the HP drive shaft, as necessary, to remove the bolts through the cutaway in the rear bearing adapter flange.
- (7) Screw in on the extractor handle until the hub/labyrinth is released, then steadily raise the hoist until the hub is clear of the LP drive shaft. Lower the hub onto a clean flat surface. Unscrew and remove the slave nuts, then remove the extractor from the hub and lower it onto a suitable container. Disconnect the hoist.
- (8) Remove the bolts from the hub, then assemble the protector (Tool 1062) to the hub labyrinth.
- (9) Remove the slave adjusting washer from the HP drive shaft.
- (10) If the HP compressor is not to be worked on for a period, assemble the split sleeves (Tool 1058) to the HP and LP drive shafts.
- (11) Continue the assembly of the HP compressor assembly as detailed in para.11.

9. Assemble the HP Turbine Simulator to the HP Compressor Assembly (SB.72-8305-154 Part 2 Standard)

NOTE: The procedure using the HP turbine simulator can only be carried out providing that the HP turbine hub and labyrinths are the original, or if replacements, have been statically balanced using a HP turbine rotor or slave rotor (Ref.72-51-03, para.9 onwards).

A. Prepare the HP Compressor Assembly.

- (1) Release and remove the three knurled nuts from the front support (Tool 292) (Ref.Fig.544) releasing the immobilizer (Tool 1339). Push the three studs of the immobilizer to engage the immobilizer in the teeth of the HP drive shaft front retaining nut, turning the rotor slightly to achieve engagement. Screw the three knurled head bolts (Tool 1341) into the three tapped holes in the front support to secure the immobilizer in engagement with the retaining nut.

OVERHAUL

- (2) Turn the stand arms 180 deg to position the rear bearing adapter uppermost. Release and remove the split sleeves (Tool 1058) from the LP and HP drive shafts. Release and remove the retaining nut from the HP drive shaft using the hand spanner wrench (Tool 410), then withdraw the spacer ring (Tool 414) from the shaft.

B. Assemble the HP Turbine Simulator.

- (1) Ensure the hydraulic ram (Enerpac) is assembled above the top plate of the lifting/assembly/extractor (Tool 1993) and the inner pot is raised to its fullest height by adjusting the nuts at the inner plate (Ref.Fig.544). Secure the combination tool to a hoist and position above the simulator (Tool 1994). Lower the hoist and secure the combination tool to the simulator with the four captive bolts in the securing ring.
- (2) Raise the hoist and position the simulator above the LP drive shaft. Carefully lower the simulator and engage the serrations of both HP shaft and simulator, release and remove the hoist.

NOTE: The simulator may be assembled in any rotational position.

- (3) Screw the inner pot onto the HP drive shaft then connect a hand operated hydraulic pump to the hydraulic ram. Operate the pump and apply a pressure of 3000 psig (20,685 kPa). Ensure the simulator abuts the bearing in the adapter, then release the pressure and disconnect the pump. Unscrew the inner pot from the HP drive shaft and release the captive bolts securing the combination tool to the simulator. Attach a hoist to the combination tool then remove the tool from the simulator, lower the tool into its container and disconnect the hoist.
- (4) Apply lubricant 'B' to the slave nut (Tool 418) then screw the nut onto the HP shaft to secure the simulator (Ref.Fig.545). Secure the lifting ring (Tool 334), with the two captive bolts, to the spanner wrench (Tool 1085), then using a hoist raise the wrench and position it above the LP drive shaft. Lower the wrench to engage the slave nut then release and remove the lifting ring and hoist.

TN14265

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (5) Using a hoist, raise the torque restrainer (Tool 1995) and position it above the wrench. Lower the restrainer until it abuts the simulator, then secure it with the four captive bolts. Disconnect and remove the hoist.
- (6) Lower the multiplier (Tool 1022) through the lifting ring (Tool 1996), then secure the multiplier to the plain side of the adapter plate (Tool 1997) with the eight captive bolts. Attach the tool assembly to a hoist and position the assembly above the torque restrainer. Lower the assembly and engage the dogs on the underside of the adapter plate with the restrainer and the gearbox drive with the wrench. Secure the plate to the restrainer with two bolts, then disconnect and remove the hoist.
- (7) Using a torquemeter wrench, tighten the HP drive shaft slave nut to 500 lbf ft (678 N.m). Attach a hoist to the lifting eyes of the torque restrainer. Unscrew the four bolts securing the restrainer to the simulator then raise the hoist to remove the restrainer and multiplier. Secure the lifting ring (Tool 334) to the spanner wrench (Tool 1085) with two captive bolts then using a hoist remove the wrench.
- NOTE: Leave the multiplier and restrainer assembled to each other in preparation for the removal of the HP drive shaft slave nut.
- (8) Assemble the two halves of the centralizing sleeve (Tool 1998) to the simulator and secure with the captive bolts to restrict the movement of the LP drive shaft.
- (9) Unscrew and remove the three bolts (Tool 1341) from the front support. Screw the three knurled nuts onto the protruding studs in the support to withdraw the immobilizer from the HP drive shaft nut allowing the HP compressor to rotate.

10. Prepare and Balance the HP Compressor and HP Turbine Simulator Assembly

A. Prepare the Balancing Machine (Avery 72N 56) (Ref.Fig.539).

(1) Refer to para.6.A. for the procedure.

B. Assemble the HP Compressor and Turbine Simulator Assembly to the Balancing Machine.

(1) Refer to para.6.B. for the procedure, but remove the centralizing sleeve (Tool 1998) instead of split sleeves (Tool 393) (Ref.para.6.B.(11)).

C. Balance the HP Compressor and HP Turbine Simulator Assembly.

NOTE: The operator must ensure that during initial use, out-of-balance correction must also be made to the simulator (Ref.para.(6)).

(1) Start the balancing machine and run the assembly up to balancing speed in accordance with the manufacturers instructions.

(2) Allow the assembly to rotate long enough to eliminate the effects of differential temperature on the readings obtained. Calibrate the machine and continue to rotate the assembly until the change in the mean average readings of unbalance at F and U (Ref. Fig.546) over a period of three minutes are less than 2 dram in.

NOTE: 1 dram in. = 45 g mm.

(3) Remove the temporary correction applied at F (Ref. para.4.C.(7)). Observe the change of unbalance at F and the initial unbalance at U. A change of unbalance at F of 220 dram in. and initial unbalance at U of 150 dram in. is acceptable and the balancing operation may continue (Ref.para.(5)).

OVERHAUL

- (4) With the unbalance readings outside the limits rectify in accordance with the following procedure.
- (a) Remove the HP compressor assembly from the balancing machine (Ref. para. 6.D.) but assemble the centralizing sleeve (Tool 1998) instead of split sleeves (Tool 393).
  - (b) Remove the simulator from the HP drive shaft (Ref. para. E.).
  - (c) Reassemble the HP compressor assembly to the balancing machine and recheck the balance (Ref. para. 4.).
  - (d) Check the abutment faces of the simulator and the slave bearing within the rear adapter for damage or foreign matter.
  - (e) Assemble the simulator to the HP compressor assembly and rebalance (Ref. para. 9 and 10).
- (5) With the unbalance readings within initial limits, balance the assembly within 6 dram in. in accordance with the following procedure.
- (a) Correct unbalance at F by the addition of balancing washers beneath the nuts securing the first stage rotor disk. On engines embodying S.B.72-73 remove the plain washers (02/1-170) from the bolts to which balancing washers are assembled. Maximum number of washers to be used are, 2 off (02/1-180), 2 off (02/1-185) and 5 off (02/1-190). Torque-tighten nuts after assembling washers between 300 and 330 lbf in. (33,9 and 37,3 N.m).
  - (b) Correct unbalance at U by the addition of balancing weights (02/3-140). Use a maximum of 5 weights to achieve balance, but a maximum of three from any one weight in the range. Retain each weight with a bolt (02/3-170) and self-locking nut (02/3-130) with lubricant 'A' applied. Ensure each nut has a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m), then torque-tighten to 100 lbf in. (11,5 N.m).

OVERHAUL

- (6) Initial balancing of the HP turbine simulator.
- (a) Remove the HP compressor and HP turbine simulator assembly from the balancing machine and assemble to the pit stand (Ref.para.6.D.) but assemble the centralizing sleeve (Tool 1998) instead of split sleeves (Tool 393).
  - (b) Remove the HP turbine simulator (Ref.para.E.) and turn through 180 deg, relative to the HP drive shaft, and reassemble to the HP compressor (Ref.para.9.B.).
  - (c) Assemble the HP compressor assembly to the balancing machine (Ref.para.6.B.).
  - (d) Observe the change of unbalance at F and U. Should the change of unbalance exceed 10 dram in. at either location, correct half the change at F or U and half on the simulator at RS and FS by the addition of balancing bolts.
  - (e) Repeat para.(a), (b), (c) and (d) and repeat as necessary until turning the simulator 180 deg relative to the compressor affects the balance at F or U by less than 10 dram in.

NOTE: For permanent balance correction of the HP turbine simulator, metal may be removed from the areas shown in Fig.546.

- D. Remove the HP Compressor and HP Turbine Simulator Assembly from the Balancing Machine.
- (1) Refer to para.6.D. for the procedure, but assemble the centralizing sleeve (Tool 1998) instead of split sleeves (Tool 393) (Ref.para.6.D.(1)).

OVERHAUL

Removing the HP Turbine Simulator  
Figure 547

OLYMPUS 598

MK.610-14-28  
OVERHAUL

E. Remove the HP Turbine Simulator from the HP Compressor Assembly.

- (1) Release and remove the three knurled nuts from the front support (Tool 292) (Ref.Fig.544) releasing the immobilizer (Tool 1339). Push the three studs of the immobilizer to engage the immobilizer in the teeth of the HP drive shaft front retaining nut, turning the rotor slightly to achieve engagement. Screw the three knurled head bolts (Tool 1341) into the three tapped holes in the front support to secure the immobilizer in engagement with the retaining nut.
- (2) Release and remove the centralizing sleeve (Tool 1996) from the turbine simulator. Using a hoist, raise the lifting ring/spanner wrench (Tool 1085) and position above the LP drive shaft. Lower the wrench to engage the slave nut, then release and remove the lifting ring and hoist.
- (3) Using a hoist raise the tool assembly of multiplier (Tool 1022), adapter plate (Tool 1997) and restrainer (Tool 1995) and position them above the LP drive shaft. Carefully lower the assembly until the restrainer contacts the simulator and the multiplier drive engages the spanner wrench. Secure the restrainer to the simulator, then disconnect and remove the hoist. Insert a spanner wrench into the multiplier then unscrew the slave nut until released. Release the restrainer and remove the tool assembly by hoist. Secure the lifting ring to the wrench, remove the wrench by hoist, then remove the slave nut from the HP drive shaft.
- (4) Ensure the hydraulic ram is assembled below the top plate of the combination tool (Tool 1993) (Ref. Fig.547) and the inner pot is raised to its fullest height by adjusting the nuts at the inner plate. Using a hoist, raise the combination tool above the LP drive shaft, then lower and secure the inner pot to the HP drive shaft and the outer ring to the simulator.

CAUTION: LEAVE THE HOIST ATTACHED.

- (5) Connect a hand operated hydraulic pump to the hydraulic ram. Operate the pump to raise the simulator from the HP drive shaft. Take up the weight of the simulator with the hoist, then release

FN3070

SUB-ASSEMBLY

MK.610-14-28  
OVERHAUL

the pressure applied to the ram. Unscrew the inner pot from the HP drive shaft, then raise the hoist to remove the simulator. Replace the simulator in its container (Tool 3051) and disconnect the hoist.

- (6) If the HP compressor is not to be worked on for a period, assemble the split sleeves (Tool 1058) to the HP and LP drive shafts.
- (7) Continue the assembly of the HP compressor assembly as detailed in para.11.

#### 11. Preparation and Assembly of the Intermediate Case Assembly

##### A. Remove the Front Bearing Adapter (Tool 1032) from the HP Compressor Assembly.

- (1) If assembled remove the split sleeves (Tool 1058) from the LP and HP drive shafts. Screw the guide sleeve (Tool 377) onto the LP drive shaft, then offer the HP support sleeve (Tool 1031) over the LP drive shaft engaging the splines, and lower it until it abuts the bearing (Ref.Fig.548).
- (2) Offer the mechanical jack (Tool 1029) over the HP support sleeve and align the captive bolts with the tapped holes in the adapter. Unscrew the jack (if required) to allow the jack to abut the adapter, then screw the captive bolts into the adapter. Using the tommy bars, screw in on the jack until it lightly abuts the HP support sleeve, then lock the jack with the lockring.
- (3) Offer the LP support sleeve (Tool 1030) into the HP support sleeve and screw it onto the HP drive shaft. Screw the sleeve onto the shaft until it abuts the HP support sleeve, then release it a quarter of a turn. Screw the three restrainer screws (Tool 1226) into the tapped holes in the end of the support sleeve and screw the screws fully in. The screws locate in front of the guide sleeve on the LP drive shaft and prevent it from moving forwards.

NOTE: Through the medium of the HP support sleeve, the mechanical jack, LP support sleeve and the three restraining screws, the LP and HP drive shafts are now supported and secured at their rear ends to the rear bearing adapter.

OVERHAUL

- (4) Rotate the pit stand arms 180 deg until the front bearing adapter is uppermost.
- (5) Remove the support (Tool 292), steady (Tool 290) and immobilizer (Tool 1339) from the LP drive shaft and the front bearing adapter (Ref.Fig.549).
  - (a) Unscrew and remove the three knurled nuts (Tool 1340) from the immobilizer studs that protrude through the support.
  - (b) Unscrew and remove the steady locking nut (Tool 291) from the steady shaft, then release the knurled screws of the support. Unscrew the support locknut until the support is released, then withdraw the support disengaging it from the pins of the immobilizer.
  - (c) Unscrew the knurled lockring, then withdraw the location bush from the LP drive shaft. Turn the steady shaft, to disengage its lobes from behind the LP drive shaft lands, and withdraw the shaft from the LP drive shaft. Assemble the knurled lockring and locking nut to the steady shaft.
  - (d) Withdraw the immobilizer from the LP drive shaft.
- (6) Remove the retaining nut from the HP rotor shaft front (Ref.Fig.525).
  - (a) Offer the steady (Tool 1158) over the LP drive shaft, align the three captive bolts with the tapped holes in the front bearing adapter, then screw the bolts into the adapter and tighten bolts.
  - (b) Offer the immobilizer (Tool 387) over the LP drive shaft and engage it in the cutaways inside the HP rotor shaft front.
  - (c) Locate the multiplier (Tool 1022) on the spanner wrench (Tool 386) and screw the spanner captive bolts into the multiplier ensuring the bolts are tight.

OVERHAUL

- (d) Offer the spanner/multiplier over the LP drive shaft and immobilizer and engage the multiplier square drive in the immobilizer, then turn the HP rotor shaft as necessary to engage the spanner pin in the cutaway in the steady and the spanner dogs in the retaining nut.
  - (e) Using a torquemeter wrench in the multiplier release the 'LEFT-HAND' threaded retaining nut.
  - (f) Remove the wrench, multiplier/spanner, immobilizer and steady from the assembly.
  - (g) Unscrew and withdraw the nut and spacer ring (Tool 988) from the rotor shaft front.
- (7) Offer the steady (Tool 288) (Ref.Fig.550) over the LP drive shaft and screw it onto the HP rotor shaft front, then screw the lifting/extracting fixture (Tool 1353) onto the steady. Align the offset thumbscrews of the lifting fixture with the tapped holes in the front bearing adapter then re-screw the thumbscrews into the adapter. Screw the fixture onto the steady until the fixture abuts the adapter, then fully tighten the thumbscrews.
- (8) Unscrew and remove the slave nuts and bolts securing the front bearing adapter to the front flange of the HP front case. Unscrew the lifting/extracting fixture handle and raise the adapter, drawing the slave bearing off the rotor shaft front. When the bearing is released, attach a hoist to the lifting fixture, then steadily raise the hoist and unscrew the lifting fixture handle until it is released from the steady. When the adapter is clear, position and lower it onto a suitable pallet, then release the hoist. Remove the spacer ring (Tool 870) from the rotor shaft front, then offer a protector (Tool 1246) over the LP and HP shafts and rest it on the HP front case flange.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

sneema

- (9) Release the locking ring of the mechanical jack attached to the rear adapter, then screw in on the jack to raise the HP compressor rotor approx. 0.125 in. (3,175 mm).

**NOTE:** The raising of the HP rotor ensures that there is sufficient clearance between the abutting flanges of the intermediate and HP case to enable the bearing assembly in the intermediate case to abut the adjusting washer on the rotor shaft front.

- B. Assemble the Intermediate Case Assembly to the HP Compressor Assembly.

**CAUTION:** THE FRANGIBLE PROBES ARE SUSCEPTIBLE TO DAMAGE DURING ASSEMBLY OF THE ENGINE MODULES, AND IF KNOCKED THEY SHOULD BE REMOVED AND SUBJECTED TO AN INSPECTION FOR CRACKING AND DISTORTION. IF A PROBE IS FOUND DAMAGED IT SHOULD BE REJECTED.

**NOTE:** Before assembling the intermediate assembly to the HP compressor assembly, ensure that all dimensional checks have been carried out, and that the assembly is complete and ready for assembly to the HP compressor (Ref.72-32-00 Assembly) (Ref. SB.72-91).

- (1) From inside the centre of the intermediate case front end, unscrew and remove the two bolts securing the LP probe, then withdraw the retaining plate, LP probe, and two adjusting washers (Ref.Fig.556).
- (2) Remove the protector (Tool 1246) from the HP front case, then unscrew and remove the steady (Tool 288) from the rotor shaft front.
- (3) Select the adjusting washer, as calculated in para.2.Y.(3), from the range (02/1-10). Should the required size be unavailable machine a washer to the required size (Ref.72-09-21 Repair, Fig.413). Offer the washer over the rotor shaft front and ensure that the washer seats correctly on the shaft. Lubricate the bearing location on the rotor shaft front with lubricant A.
- (4) Assemble the immobilizer (Tool 1352) to the LP drive shaft (Ref. Fig.551).
  - (a) Unscrew the lockring and withdraw the location bush.

- (b) Offer the holder into the LP drive shaft sliding the lobes of the holder through the cutaways in the shaft, turn the holder so that the lobes locate behind the lands of the shaft.
- (c) Slide the location bush down over the holder, ensuring the bush locking pin locates in one of the cutaways in the drive shaft. Screw the lockring onto the holder shaft and tighten the lockring.
- (5) Attach the multiple leg sling (Tool 1089) to the intermediate case front flange, identified by the larger diameter flange with a groove in its mating face (Ref.Fig.551).
- (a) Attach a hoist to the ring of the multiple leg sling and position the hoist over the intermediate case.
- (b) Remove the thumbnuts from the three attachment bracket studs. Evenly dispose the brackets on the front flange of the case, then insert the studs through the bolt holes and secure the brackets with the thumbnuts.
- (6) Raise the hoist and position the intermediate case over the HP front case. Examine the bearing inner races and align the V marks on the races with one another, then ensure the oil thrower is flush with the races. If assembled, release and remove the three transport blocks (Tool 1232) from the rear flange of the case. Steadily lower the intermediate case guiding the oil thrower and inner races over the immobilizer and onto the rotor shaft. Release and remove the sling from the intermediate case and the hoist.
- (7) Pass the sleeve (Tool 520), larger outside diameter uppermost, over the immobilizer and sit the sleeve in the recess of the bevel gear.

OVERHAUL

- (8) Offer the mechanical puller (Tool 1351) (Ref.Fig.552) to the immobilizer. Screw the puller handle onto the immobilizer and press the bearing inner races onto the rotor shaft front. When the intermediate case rear flange is approx. 0.70 in. (17,7 mm) from the HP front case flange, align the serrations on the bevel gear with those on the rotor shaft front. Extreme care must be taken until the serrations are meshed. Align with one another, by viewing through the view/access holes in the puller, or if in doubt, by removing the puller to ensure alignment, before continuing to press the bearing on. As the flanges of the intermediate and HP front case approach each other, align the locating dowel holes in the intermediate case flange with the locating dowel in the HP front case flange. Ensure the bearing has been pressed fully onto the rotor shaft front.
- (9) Unscrew the handle of the puller and remove it from the immobilizer. Unscrew the immobilizer lockring and withdraw the location bush from the LP drive shaft, then turn the holder and withdraw its lobes through the cutaways in the LP drive shaft. Slide the location bush over the holder, then screw the lockring onto the holder.
- (10) Offer the adapter (Tool 891) (Ref.Fig.552) into the centre of the intermediate case and rest it on the bevel gear.
- (11) Screw the extension (Tool 521) onto the hydraulic mechanical driver (Tool 900). Offer the driver to the adapter, slide the driver housing into the adapter and screw the housing onto HP rotor shaft front.

CAUTION: Do not overtighten.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

sneema

- (12) Connect the feed pipe from a hand operated hydraulic pump to the hydraulic driver connection (Ref.Fig.552). Operate the hand pump and apply a pressure to the driver, ensuring that as the piston moves down, the thrust plate locates correctly over the adapter. Apply a pressure of 7500 psig (51 700 kPa) to the driver. Bolt a (Mercer) clock gauge to the clock holder, positioning the pointer in the hole in the thrust plate and engage it on the pin. Ensure the pressure of 7500 psig (51 700 kPa) is maintained, then set the clock to '0' and check for evidence of creep for a period of 5 minutes. If creep occurs, check for a further period of 5 minutes. Repeat until no creep occurs.
- (13) Release and remove the clock gauge. Release the hydraulic pressure and check that the driver thrust plate rises (under its spring pressure). Disconnect the feed pipe from the driver then unscrew and withdraw the driver and extension. Remove the adapter from the intermediate case.

**CAUTION:** THE FRANGIBLE PROBES ARE SUSCEPTIBLE TO DAMAGE DURING ASSEMBLY OF THE ENGINE MODULES, AND IF KNOCKED THEY SHOULD BE REMOVED AND SUBJECTED TO AN INSPECTION FOR CRACKING AND DISTORTION. IF A PROBE IS FOUND DAMAGED IT SHOULD BE REJECTED.

- (14) Place the labyrinth probe ring (72-61-00/1-30) in a freezing agent (2-3 min in liquid nitrogen or 15 min in Cardice). Using protective gloves remove the probe ring from the freezing agent and offer the ring over the HP rotor shaft front to locate in the recessed face of the bevel gear. Ensure the probe ring seats correctly on the gear and does not foul the HP probe.
- (15) Offer the locking washer (72-61-00/1-20) into the probe ring and locate the washer lugs in the probe ring cutaways. Apply lubricant 'B' to the threads of the rotor shaft front then screw the LEFT-HAND threaded retaining nut (72-61-00/1-10) onto the shaft. Locate the spanner wrench steady (Tool 397) (Ref.Fig. 554) on the inner part of the intermediate case and secure the steady with its captive bolts, then hand-tighten the retaining nut using spanner wrench (Tool 1324).

OVERHAUL

- (16) Apply lubricant 'B' to 20 bolts (6-30) and 3 bolts (6-147), then assemble the bolts (6-30) and nuts (6-20) to the unmarked bolt positions and the bolts (6-147) and nuts (6-145) to the holes numbered 17, 18 and 19 on the HP compressor/intermediate case flange (Ref.Fig.553).
- (17) Release the mechanical jack lockring and unscrew the jack (Tool 1029) (Ref.Fig.548) to lower its inner member and through the HP drive shaft the intermediate case, until its flange abuts the HP case. Lower the jack a further 0.125 in. (3,175 mm) approx. then lock the lockring. Ensure the flange nuts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m), torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (18) Offer the immobilizer (Tool 387) (Ref.Fig.554) over the LP drive shaft and engage it in the cutaways inside the HP rotor shaft front. Ensure that the multiplier (Tool 1022) is bolted to the spanner wrench (Tool 386), then offer the spanner/multiplier over the immobilizer and engage the multiplier square drive in the immobilizer. Turn the HP rotor shaft as necessary to engage the spanner pin in the cutaway in the steady and the spanner dogs in the retaining nut. Using a torquemeter wrench in the multiplier, torque-tighten the 'LEFT-HAND' threaded retaining nut between 1200 lbf ft and 1300 lbf ft (1627 and 1763 N.m) (readings of 48 to 52 lbf ft on the wrench because of the 25 to 1 multiplier). Remove the torquemeter wrench, multiplier/spanner, immobilizer and steady from the assembly. Do not lock the locking washer.
- (19) Offer the steady support (Tool 396) (Ref.Fig.555) over the LP drive shaft and locate its flanged spigot in the intermediate inner case. Align the clearance hole in the steady with the stepped pin in the casing, then screw the steady bolts into the casing. Screw in on the hand nut until the support abuts the LP drive shaft.

OVERHAUL

C. Check the HP Rotor Shaft Front Adjusting Washer for Correct Thickness.

- (1) Rotate the pit stand arms 180 deg until the rear bearing adapter is uppermost. Release the mechanical jack lockring, then release the jack by unscrewing.
- (2) Using the 'GO' and 'NO GO' checking gauges (Tool 50) check the clearance between the rear (bottom) outer blade platforms of the stage 7 rotor disk and the three internal bosses in the rear bearing adapter (Ref.Fig.511 for the position). The clearance must be between 2.307 and 2.312 in. (58,597 and 58,724 mm). If the gap (as indicated by the gauges) is incorrect, the adjusting washer (72-33-02/1-10) assembled to the rotor shaft front must be replaced by an adjusting washer of the required thickness, to give the correct clearance (Ref. para.G. for the procedure).
- (3) On completion of a satisfactory clearance check between the stage 7 rotor disk and the rear flange of the HP rear case, screw in on the mechanical jack until it abuts the HP drive shaft, then lock the lockring. Rotate the pit stand arms 180 deg. Release the steady/support (Tool 396) captive bolts and remove the steady.
- (4) Lock the retaining nut (72-61-00/1-10) with its locking washer (72-61-00/1-20) using the peening fixture (Tool 990) and pins (Tool 991, 1009 and 1010).
  - (a) Offer the fixture over the LP drive shaft and into the labyrinth, positioning the 'C' washer at the position the washer is to be locked, and locating the locator pin in a castellation of the nut.

OVERHAUL

Printed in England

- (b) Insert No.1 pin (Tool 991) into the hole in the fixture by the 'C' washer aligning the flat on the pin with the grub screw in the fixture. Using a drift and hammer, drift No.1 pin down onto the locking washer until the pin abuts the 'C' washer.
- (c) Remove No.1 pin from the fixture, then use No.2 and 3 pins (Tool 1009 and 1010) (in sequence) to lock the washer into the castellations of the retaining nut.
- (d) Using the fixture and pins (in sequence) lock the nut at a further two positions, ensuring that the three positions the nut/washer are locked at, are evenly spaced.

**D. Assemble the Static Seal Housing to the Intermediate Case.**

- (1) Check that the 12 hollow locating pins (72-32-00/5-70) are assembled to the seal housing then assemble the housing (72-32-00/5-40) (note the offset position) to its segmented location in the inner case (Ref.Fig.556).
- (2) Assemble a keywasher (72-32-00/5-60) to each of the housing securing bolt positions, apply lubricant B to the threads of the bolts (72-32-00/5-50) then secure the housing to the inner case.
- (3) Torque-tighten the bolts between 80 and 90 lbf in. (9,0 and 10,2 N.m) and lock the keywashers.

**E. Determine Thickness of LP Bearing Failure Probe Adjusting Washers (Ref.Fig.556).**

**CAUTION:** THE FRANGIBLE PROBES ARE SUSCEPTIBLE TO DAMAGE DURING ASSEMBLY OF THE ENGINE MODULES, AND IF KNOCKED THEY SHOULD BE REMOVED AND SUBJECTED TO AN INSPECTION FOR CRACKING AND DISTORTION. IF A PROBE IS FOUND DAMAGED IT SHOULD BE REJECTED.

**NOTE:** If the dimension 'D' and the thickness of the adjusting washers (72-32-00/3-180) were recorded during assembly of the Intermediate Case Assembly (Ref. Assembly 72-32-00 Para.14.B), proceed to Para.(4).

- (1) Measure and record the thickness of the two probe adjusting washers (72-32-00/3-180).
- (2) Assemble the two adjusting washers, the probe and probe retainer (72-32-00/3-170, 160) to the intermediate case and temporarily secure them with bolts (72-32-00/3-150).
- (3) Measure from the front face of the intermediate case (inner) flange to the rear face of the probe and record as dimension 'D'.
- (4) Obtain dimension 'G' recorded during dimensional check of the LP Compressor Assembly on engine build (Ref. Assembly 72-00-00 Para.7.A) (or Sub-assembly 72-31-00 Para.2.D, if recorded during build of the LP Compressor Assembly).

NOTE: If the dimension 'G' is not available, pass dimensions recorded in paras.(1) and (3) to engine build section for use in final calculation of required washer thickness.

- (5) Using the following formula, calculate the required thickness of the LP probe adjusting washers (72-32-00/3-180) to produce the desired clearance between the probe and probe operating ring of between 0.024 and 0.029 in. (0,609 and 0,736 mm) for SB.72-21 standard, or between 0.020 and 0.025 in. (0,508 and 0,635 mm) for pre-SB.72-21 standard engines.
  - (a) The required adjusting washer thickness =  

$$D + (\text{size of washer assembled for check}) + (\text{desired clearance}) - G.$$
- (6) If adjustment is required, select two adjusting washers (72-32-00/3-180) that will produce a clearance between 0.024 and 0.029 in. (0,609 and 0,736 mm) for SB.72-21 standard, or between 0.020 and 0.025 in. (0,508 and 0,635 mm) for pre-SB.72-21 standard engines.

OVERHAUL

- (7) Remove the LP probe and retainer (72-32-00/3-170, -160) from the oil distributor, then remove the two adjusting washers used for the check.
- (8) Reassemble the LP probe, retainer and the two selected adjusting washers (72-32-00/3-180) (72-09-21 Repair, Fig.407) to the oil distributor. Secure the probe with two bolts (72-32-00/3-150) lubricated with lubricant 'A'. Torque-tighten the bolts to 135 lbf in. (15,2 N.m.). Locking (run-down) torque 3.5 lbf in. (0,4 N.m.).

F. Assemble the Probe Assembly to the Intermediate Case Oil Distributor (Ref.Fig.556).

CAUTION: THE FRANGIBLE PROBES ARE SUSCEPTIBLE TO DAMAGE DURING ASSEMBLY OF THE ENGINE MODULES, AND IF KNOCKED THEY SHOULD BE REMOVED AND SUBJECTED TO AN INSPECTION FOR CRACKING AND DISTORTION. IF A PROBE IS FOUND DAMAGED IT SHOULD BE REJECTED.

- (1) Position the two adjusting washers (72-32-00/3-180) over the tapped holes in the oil distributor block (72-32-00/3-410) in line with No.2 vane position. Assemble the probe (72-32-00/3-170) to the probe retainer (72-32-00/3-160). Apply lubricant 'A' to the threads of the two bolts (72-32-00/3-150) then assemble the bolts to the probe assembly. Locate the probe in the distributor block and the bolts through the adjusting washers. Screw the bolts into the block and ensure the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m), torque-tighten to 135 lbf in. (15,2 N.m).
- (2) Offer the steady support (Tool 396) (Ref.Fig.555) over the LP drive shaft and locate its flanged spigot in the intermediate inner case. Align the clearance hole in the steady with the stepped pin in the casing then screw the steady bolts into the case. Screw in the hand nut until the support abuts the LP drive shaft.
- (3) Rotate the pit stand arms 180 deg until the rear bearing adapter is uppermost.

#### G. Assemble the Brackets to the Compressor/Intermediate Case.

- (1) Assemble the brackets to the compressor case/intermediate case abutment flanges as shown on Fig.553. Apply lubricant 'B' to the securing bolts. Ensure the nuts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m), torque-tighten the locknuts between 67 and 73 lbf in. (7,6 and 8,2 N.m).

NOTE: The HP compressor/intermediate case assembly build is now complete. The assembly must now be transferred to the mobile stand and prepared for engine build. (Ref.para.12).

#### H. Replacement of the HP Rotor Shaft Front Adjusting Washer.

NOTE: The procedure for replacing the adjusting washer need only be carried out if the gauge check (Ref.para.C) is incorrect.

- (1) Rotate the pit stand arms 180 deg until the intermediate case is uppermost. Release and remove the nuts and bolts from the intermediate case/HP front case flanges. Release and remove the steady support from the LP drive shaft.

OVERHAUL

- (2) Release the mechanical jack (Tool 1029) lockring, then screw in on the jack until the HP support sleeve (Tool 1031) lightly abuts the HP drive shaft bearing. Screw the LP support sleeve (Tool 1030) onto the HP drive shaft until it lightly abuts the slave distance piece.
- (3) Locate the spanner steady (Tool 397) on the inner part of the intermediate case and secure the steady to the case with its captive bolts. Offer the immobilizer (Tool 387) (Ref.Fig.554), over the LP drive shaft and engage it in the cutaways inside the HP rotor shaft front. Ensure that the multiplier (Tool 1022) is bolted to the spanner wrench (Tool 386), then offer the spanner/multiplier over the immobilizer and engage the multiplier square drive in the immobilizer. Turn the HP rotor shaft as necessary to engage the spanner pin in the cutaway in the steady and the spanner dogs in the retaining nut. Using a torque-meter wrench in the gearbox, unscrew the 'LEFT-HAND' threaded retaining nut. Remove the torquemeter wrench, multiplier/spanner and immobilizer from the assembly. Remove the retaining nut and locking washer from the HP rotor shaft front.
- (4) Remove the intermediate case from the HP front case (Ref.Fig.557).
  - (a) Attach a hoist to the lifting/extracting fixture (Tool 411) lifting ring then position the hoist over the intermediate case.
  - (b) Screw in the extractor handle, then lower the extractor onto the intermediate inner case locating the extractor clearance hole over the dowel in the intermediate case flange, and aligning the captive bolts of the extractor with the tapped holes in the case. Screw in and fully tighten the captive bolts.

TN47754

OVERHAUL

- (c) Unscrew the extractor handle so that the extractor pot abuts the HP rotor shaft front, then continue unscrewing the extractor handle until the intermediate case/HP rotor bearing is released from the rotor shaft front.

NOTE: The extractor handle will be stiff to turn, but this is normal.

- (d) Raise the hoist until the intermediate case is clear, then position it over a suitable pallet. Bolt three (evenly spaced) transport blocks (Tool 1232) to the bottom flange of the outer case, then lower the case onto the pallet. Release the hoist.
- (5) Withdraw the adjusting washer from the rotor shaft front. Offer an adjusting washer, of the required thickness, as ascertained in para.C.(2) over the rotor shaft front. Ensure that the washer seats correctly without any gap between it and the rotor shaft front.
- (6) Assemble the immobilizer (Tool 1352) to the LP drive shaft (Ref.Fig.551).
- (a) Unscrew the lockring and withdraw the location bush.
- (b) Offer the holder into the LP drive shaft sliding the four lobes of the holder through the four cutaways in the LP drive shaft, then turn the holder so that the lobes locate behind the lands of the LP drive shaft.
- (c) Slide the location bush down over the holder ensuring that the bush locking pin locates in one of the cutaways in the drive shaft. Screw the lockring onto the holder shaft and tighten the lockring.

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (7) Screw in the handle of the lifting/extracting fixture (Tool 411) then attach a hoist to its lifting ring. Raise the hoist and release and remove the three transport blocks (Tool 1232) from the rear flange of the case. Position the intermediate case over the HP front case, then examine the bearing inner races and align the V marks on the races with one another and ensure the oil thrower is flush with the races. Steadily lower the case guiding the oil thrower and inner races over the immobilizer and onto the rotor shaft front. Release and remove the lifting fixture from the intermediate case and the hoist.
- (8) Offer the mechanical puller (Tool 1351) (Ref.Fig.552) to the immobilizer and screw the handle onto the immobilizer shaft.
- (9) Screw the puller handle onto the immobilizer and press the bearing inner races onto the rotor shaft front. When the intermediate case rear flange is approx. 0.70 in. (17,7 mm) from the HP front case flange, align the serrations on the bevel gear with those on the rotor shaft front. Extreme care must be taken until the serrations are meshed to ensure they do not abut, but align with one another, by viewing through the view/access holes in the puller, or if in doubt, by removing the puller to ensure alignment, before continuing to press the bearing on. As the flanges of the intermediate and HP front case approach each other, align the locating dowel hole in the intermediate case flange with the locating dowel in the HP front case flange. Ensure the bearing has been pressed fully onto the rotor shaft front.
- (10) Unscrew the handle of the puller and remove it from the immobilizer. Unscrew the restrainer lockring and withdraw the location bush from the LP drive shaft, then turn the holder and withdraw its lobes through the cutaways in the LP drive shaft. Slide the location bush over the holder, then screw the lockring onto the holder.

TN47756

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (11) Offer the adapter (Tool 891) (Ref.Fig.552) into the centre of the intermediate case.
- (12) Screw the extension (Tool 521) onto the hydraulic mechanical driver (Tool 900). Lower the driver over the adapter until it abuts the HP rotor shaft front, screw the adapter housing onto the rotor.

NOTE: Do not overtighten.

- (13) Connect the feed pipe from a hand operated hydraulic pump to the hydraulic driver connection (Ref.Fig.552). Ensure the location pins in the bevel gear are positioned in the cutaways in the adapter, then operate the hand pump and apply a pressure to the driver, ensuring that as the piston moves down, the thrust plate locates correctly over the adapter. Apply a pressure of 7500 psig (51 700 kPa) to the driver. Bolt a (Mercer) clock gauge to the clock holder, positioning the pointer in the hole in the thrust plate and engage it on the pin. Ensure the pressure of 7500 psig (51 700 kPa) is maintained, then set the clock to '0' and check for evidence of creep for a period of 5 minutes. If creep occurs, check for a further period of 5 minutes. Repeat until no creep occurs.
- (14) Release and remove the clock gauge. Release the hydraulic pressure and check that the driver thrust plate rises (under its spring pressure). Disconnect the feed pipe from the driver then unscrew and withdraw the driver and extension. Remove the thrust adapter from the intermediate case.
- (15) Offer the locking washer (72-61-00/1-20) into the probe ring and locate the washer lugs in the probe ring cutaways. Screw the 'LEFT-HAND' threaded retaining nut (72-61-00/1-10) onto the rotor shaft. Locate the spanner wrench steady (Tool 397) on the inner part of the intermediate case and secure the steady with its captive bolts, then hand-tighten the retaining nut using spanner wrench (Tool 1324).

PRINTED IN ENGLAND

TN47757

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (16) Apply lubricant 'B' to 20 bolts (6-30) and 3 bolts (6-147), then assemble the bolts (6-30) and nuts (6-20) to the unmarked bolt positions and the bolts (6-147) and nuts (6-145) to the holes numbered 17, 18 and 19 on the HP compressor/intermediate case flanges (Ref.Fig.553).
- (17) Release the mechanical jack lockring and unscrew the jack (Tool 1029) to lower its inner member and through the HP drive shaft the intermediate case, until its flange abuts the HP case. Lower the jack a further 0.125 in. (3,175 mm) approx. then lock the lockring. Ensure the flange nuts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m), torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (18) Offer the immobilizer (Tool 387) (Ref.Fig.554) over the LP drive shaft and engage it in the cutaways inside the HP rotor shaft front. Ensure that the multiplier (Tool 1022) is bolted to the spanner wrench (Tool 386), then offer the spanner/multiplier over the immobilizer and engage the multiplier square drive in the immobilizer. Turn the HP rotor shaft as necessary to engage the spanner pin in the cutaway in the steady and the spanner dogs in the retaining nut. Using a torque-meter wrench in the multiplier, torque-tighten the 'LEFT-HAND' threaded retaining nut 1200 lbf ft and 1300 lbf ft (1627 and 1763 N.m) (readings of 48 to 52 lbf ft on the wrench because of the 25 to 1 multiplier). Remove the torque-wrench, multiplier/spanner, immobilizer and steady from the assembly. Do not lock the locking washer.
- (19) Offer the steady support (Tool 396) (Ref.Fig.555) over the LP drive shaft and locate its flanged spigot in the intermediate inner case. Align the clearance hole in the steady with the stepped pin in the casing, then screw the steady bolts into the casing. Screw in on the hand nut until the support abuts the LP drive shaft.
- (20) Check the HP rotor shaft front adjusting washer for correct thickness, repeat para.C.

12. Prepare the HP Compressor/Intermediate Case Assembly for Engine Build

A. Assemble the HP Compressor/Intermediate Case to the Mobile Stand (Ref.Fig.558).

- (1) Unscrew and remove the three restrainer screws (Tool 1226) (Ref.Fig.548) from the LP support sleeve (Tool 1030), then unscrew and remove the sleeve from the HP drive shaft.
- (2) Unscrew the captive bolts of the mechanical jack (Tool 1029) until released from the adapter, then remove the jack from the adapter. Unscrew and remove the HP support sleeve (Tool 1031) from the HP drive shaft, then unscrew and remove the guide sleeve (Tool 377) from the LP drive shaft.
- (3) Offer the spacer sleeve (Tool 389) over the LP drive shaft and screw it onto the HP drive shaft until it abuts the rear bearing adapter, then screw the slave retaining nut (Tool 1042) into the LP drive shaft until it abuts the spacer sleeve.
- (4) Screw the lifting fixture (Tool 1043) onto the spacer sleeve, then attach a hoist to the lifting fixture. Remove the nuts and washers securing the rear bearing adapter extensions to the pit stand arms. Steadily raise the hoist until the arm locating pins are clear, then traverse the hoist and guide the assembly out sideways from the pit stand, and position it over the mobile stand (Tool 1036). Ensure the brake of the mobile stand is applied and the stand clamps are clear. Steadily lower the assembly onto the stand and secure with the stand clamps. Release the hoist.
- (5) Unscrew and remove the lifting fixture (Tool 1043), then unscrew and remove the retaining nut (Tool 1042) from the LP drive shaft. Unscrew and remove the spacer sleeve (Tool 389) from the HP drive shaft. Assemble the split sleeves (Tool 1058) to the LP drive shaft.

OVERHAUL

- (6) Pass the larger end of the canvas protector (Tool 210) over the LP drive shaft and position and tighten its lower draw string below the larger rear bearing adapter flange. Tighten and tie off the upper draw string to enclose the LP drive shaft.

B. Assemble Brackets to the HP Compressor Case (Front) at Stage 3 Stator Vane Location.

- (1) Assemble brackets to the underside of the compressor case (Ref.Fig.559).

NOTE: Two standards of HP compressor case (front) are in existence, some require a blanking plate at the stage 3 stator vane location.

- (a) To a case requiring a blanking plate assemble the blanking plate (4-380) to the case and secure with 13 bolts (4-360). Ensure each bolt is lubricated, lubricant 'A', and has a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m). Torque-tighten to 100 lbf in. (11,5 N.m). Wire-lock each plate end, securing bolt to an adjacent bolt.
- (b) To a case requiring a blanking plate assemble and secure the following brackets (4-290), (5-320), (5-370), (5-100), (4-240), (4-200) and (4-160) to the case as shown in Fig.559. Apply lubricant 'A' to the threads of all securing bolts and ensure each bolt has a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m). Torque-tighten the securing bolts to 100 lbf in. (11,5 N.m).

- (c) To a case not requiring a blanking plate assemble and secure the following brackets (4-280), (5-310), (5-360), (5-90), (4-230), (4-190) and (4-150), to the case as shown in Fig.559. Apply lubricant 'A' to the threads of all securing bolts and ensure each bolt has a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m). Torque-tighten the securing bolts to 100 lbf in. (11,5 N.m).
- (2) Assemble brackets to the left and right-hand side of the compressor case (Ref.Fig.560).
  - (a) Apply lubricant 'A' to all bolts unless stated otherwise. Check that all bolts have a minimum locking (run-down) torque of 10 lbf in. (1,1 N.m) unless stated otherwise.
  - (b) Assemble the bracket (4-30) to the case, secure with two bolts (4-10) and plain washers (4-20). Torque-tighten the bolts to 100 lbf in. (11,5 N.m).
  - (c) Assemble the bracket (4-350) to the case, secure with two bolts (4-340). Interpose two plain washers (4-355) between the bracket and case. Torque-tighten the bolts to 100 lbf in. (11,5 N.m).
  - (d) Assemble the oil cooler front mounting bracket (4-60A), (4-60B).
    - (i) On engines pre-SB.72-10 locate the distance piece (4-70) on the forward (lower) headless pin and align the bolt-holes. Assemble the bracket (4-60) to the case and secure with four bolts, two bolts (4-50) in the forward location and two bolts (4-40) in the rear (upper) location. Torque-tighten the bolts to 100 lbf in. (11,5 N.m).

- (ii) On engines embodying SB.72-10 assemble the bracket (4-60B) to the case and secure with four bolts (4-50B). Torque-tighten the bolts to 100 lbf in. (11,5 N.m).
- (e) Assemble the bracket (4-110) to the case and secure with two bolts (4-100). Torque-tighten the bolts to 100 lbf in. (11,5 N.m).
- (f) Assemble the bracket (5-130) to the case, secure with two bolts (5-120). Torque-tighten the bolts to 100 lbf in. (11,5 N.m).
- (g) On engines pre-Mod.7848 assemble the mounting bracket (aircraft supply) for the air starter air supply tube, secure using bolts (5-140). Torque-tighten and wire-lock bolts as for bracket (5A-170) para.h.
- (h) On engines embodying Mod.7848 assemble the mounting bracket (5A-170) to the case and secure with five bolts (5A-140B) with lubricant 'C' applied. Torque-tighten the bolts to 100 lbf in. (11,5 N.m). Wire-lock the central bolt in the upper flange to the vane securing bolt within the bracket. Wire-lock the right-hand bolt in the lower flange to the vane securing bolt above.
- (j) Assemble the bracket (5-270) to the case and secure with four bolts (5-280). Torque-tighten the bolts to 100 lbf in. (11,5 N.m). Secure the guide tube to the bracket (6-170) at the HP compressor/intermediate flange with two loop clamps (5-200) bolts (5-230) plain washers (5-220) and self-locking nuts (5-210). Position the plain washers beneath the boltheads. Torque-tighten to 100 lbf in. (11,5 N.m).

- (k) Assemble the bracket (5-400A) to the case and secure with two bolts (5-390A), on engines embodying Mod.8160 assemble the bracket (5A-400B). On engines embodying SB.75-10 assemble the bracket (5A-400C) secure this bracket with two bolts (5A-390B) and plain washers (5A-395). Torque-tighten the bolts to 100 lbf in. (11,5 N.m).
- (l) All unused holes at the stage 3 stator vane location are to be blanked using bolts (4-320) and plain washers (4-330).
- (m) Secure the intermediate case drain tube to the bracket (6-230) located on the HP compressor/ intermediate case flange. Use bolt (72-32-00/4-320) with lubricant 'A' applied, plain washers (72-32-00/4-330) and nut (72-32-00/4-310). To make up any gap between the tube flange and bracket use any number of the three washers for packing purposes as required. Washers not used for this purpose must be positioned beneath the nut (Ref.Fig.561). Ensure the nut has a locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten to 135 lbf in. (15,2 N.m).

CAUTION: DO NOT ATTEMPT TO DISTORT TUBE TO ACHIEVE ALIGNMENT.

- (n) After the tube has been secured check that the clearance between the tube and the sump adapter plate is not less than 0.050 in. (1,270 mm).

NOTE: The assembly is now ready to be transferred to engine build 72-00-00 Assembly.

NOTE: If SB.72-91 has been incorporated, module interchangeability will be affected. Check to ensure that the module identification plate is in accordance with the interchangeability chart.

OVERHAUL

HP COMPRESSOR CASE AND VANES - SUB-ASSEMBLY

1. General

- A. Prior to commencing assembly, refer to 72-09-00 Assembly for general information.
- B. Throughout the text, special tools are quoted by their reference number; e.g. Tool 1324. For a complete List of the tooling required for assembly and for the Manufacturers Part Number, refer to Special Tools, Fixtures and Equipment, Table 1002.
- C. During the sub-assembly procedure, reference will be made to the Illustrated Parts Catalogue (I.P.C.) to identify those items where the nomenclature does not positively identify them due to the duplication of the title e.g. bolts, vanes, plugs etc. An item will be identified as bolt (3-60), the 3 referring to the I.P.C. Fig.No., and the 60 referring to the Item No.

2. Assemble the Rear Case (Ref.Fig.501)

A. Assemble Exit Guide Vanes to Rear Case.

- (1) Identify the top of the case by examining the periphery of the end flange for the word 'TOP', or, if this is not evident, examine the flange for a shouldered pin, or the recessed hole for the pin, which is at the top position. Reference to positioning of items will then be as viewed from the front of the compressor, the rear being the flanged end of the rear case.
- (2) Place the rear case on a suitable clean protected flat surface, with the rear flange resting on the surface with the pin (if assembled) over the edge of the surface.
- (3) On engines to SB.72-8806-313 standard, assemble the liners (8-117-118) to the stage 7 exit guide vane grooves. Ensure that the end gaps of the liners are aligned with the blade loading slot and that the bolt and probe holes in the case are not obscured by the liners.

PRINTED IN ENGLAND

OLYMPUS 593

MK.610-14-28  
OVERHAUL

sneema

- (4) Apply lubricant 'A' to the lower exit guide vane groove or liner.

**NOTE:** Ensure that any repaired vanes are evenly distributed around the case and that the aggregate depth of blending does not exceed 2.800 in. (71,12 mm) (Ref.72-33-01, Repair No.2).

- (5) Remove the exit guide vanes from their container/platform (Tool 1373 and 1390), and with the trailing edge cutaway of each vane at the bottom, engage the vanes in the groove loading slot on the left-hand side of the case, and ease them round the groove in either direction.
- (a) On cases with single probe inspection (Mod.8039), assemble 128 vanes (3-110), one probe vane (3-130), eight bolted vanes (3-120) and one bolted probe vane (3-131) in the positions shown in Figure 501.
- (b) On cases with double probe inspection (post Mod.8039), assemble 125 vanes (3-110), three probe vanes (3-130) and ten bolted vanes (3-120) in the positions shown in Figure 501. The three probe vanes are positioned in between the two bolted vanes secured by the probe mounting block bolts.
- (6) Apply lubricant 'C' to 16 new bolts (3-60), then secure each of the eight bolted vanes that are not aligned with the probe mounting block (3-100) or retaining plate (3-75), with two sleeves (3-70) and bolts (3-60). Torque-tighten the bolts to 100 lbf in. (11,5 N.m), then wire-lock the two bolts of each vane together.
- (7) Using suitable measuring equipment, measure the distance between the (inner) tips of two diametrically opposite vanes. Repeat the check at three further equi-spread positions and record the average dimension. Refer to 72-00-51 para.9 for the dimension of the seal diameter and ensure the minimum tip clearance of the vanes is within the dimension quoted in the Fits and Clearances Schedule (72-33-00) FCS 135.

B. Assemble Exit Guide Vane Probe Blanking Plug to Rear Case  
(single inspection probe; Mod.8039 cases only).

- (1) Apply lubricant 'C' to two new bolts (3-60, 74), then position the retaining plate (3-75) on the lower right-hand side of the case and secure by inserting a bolt (3-74) through the plate and into the bolted vane (3-131). Assemble a bolt (3-60) and sleeve (3-70) to the bolted vane (3-131). Torque-tighten the bolts to 100 lbf in. (11,5 Nm).
- (2) Check that the probe vane is correctly assembled by inserting the probe checking pin (Tool 289) through the retaining plate and ensuring that it passes through the vane.
- (3) Apply lubricant 'C' to the blanking plug (3-73), and screw it into the retaining plate. Torque-tighten to 65 lbf in. (7,3 Nm). Wire-lock the plug and the two bolts together.

C. Assemble Exit Guide Vane Probe Blank Plugs to Rear Case  
(double inspection probe; post Mod.8039 cases only).

- (1) Apply lubricant 'C' to four new bolts (3-90), then position the probe mounting block (3-100) on the lower right-hand side of the case and secure the block by inserting the bolts through the block and screwing them into the bolted vanes. Torque-tighten the bolts to 100 lbf in. (11,5 N.m), then wire-lock the two bolts of each vane together.
- (2) Check that the probe vanes are correctly assembled by inserting the probe checking pin (Tool 289) into each of the two holes in the mounting block and ensure that it passes through the vanes.
- (3) Apply lubricant 'A' to the two blank plugs (3-80) then screw the two plugs into the probe mounting block using a square drive. Torque-tighten each plug in turn in gradual stages until both reach a torque of 70 lbf in. (7,9 N.m), then wire-lock the plugs together.

OLYMPUS 593

MK.610-14-28

OVERHAUL

D. Assemble Shouldered Pin.

- (1) Check that a shouldered pin (8-110) is assembled to the top position in the rear flange of the case. If the pin is not assembled, place the pin (8-110) in a freezing agent for approximately 20 minutes. Remove the pin and assemble it from the rear into the recessed hole in the rear flange ensuring that the shoulder does not protrude above the surface of the flange.

3. Assemble the Front Case (Ref.Fig.502)

A. Assemble Stage 5 Stator Vanes to Front Case.

- (1) Identify the top of the case, by examining the periphery of either flange for the word 'TOP', or, if this is not evident, examine the flange for the shouldered pin, or the recessed hole for the pin which is at the top position.
- (2) Place the front case on a clean, protected, flat surface, with the rear, larger diameter flange uppermost for ease of assembling the vanes. Ensure that the shouldered pin (if assembled) does not rest on the surface. If required, assemble the multiple leg sling (Tool 1053) to the flange of the case to move the case onto the selected working surface.
- (3) Apply lubricant 'A' to the stage 5 stator vane groove at the top of the case.

NOTE: Ensure that any repaired vanes are evenly distributed around the case and that the aggregate depth of blending does not exceed 2.000 in. (50,80 mm) (Ref.72-33-01, Repair No.2).

OVERHAUL

- (4) Compressor case front (except B925023, B925024, B925032 and B925036) (Ref.Fig.502).

- (a) Remove the stage 5 vanes from their container/platform (Tool 1373 and 1390), and with the trailing edge (shorter length) of the vane towards the rear (uppermost) end of the case, engage the vanes in the groove loading slot at the top left-hand side of the case and ease them round in either direction. Assemble 86 vanes (2-220), six probe vanes (2-240) and four bolted vanes (2-230) to the groove in the position shown in Fig.502.

NOTE: Each of the two sets of three probe vanes is positioned to make two inspection ports.

- (b) Apply lubricant 'C' to the eight bolts (2-200), then secure each of the four bolted vanes with two sleeves (2-210) and two bolts (2-200), inserting the bolts through the cutaways in the outer skin at the top and bottom of the case. Torque-tighten the bolts to 210 lbf in. (24 Nm), then wire-lock the bolts together at each vane.

- (5) Compressor case front B925032 and B925036 (Ref.Fig.502A).

- (a) Remove the stage 5 vanes from their container/platform (Tool 1373 and 1390), and with the trailing edge (shorter length) of the vane towards the rear (uppermost) end of the case, engage the vanes in the groove of the loading slot at the top of the case and ease them round in either direction. Assemble 85 vanes (2-220), six probe vanes (2-240), four bolted vanes (2-230) and one bolted vane (2-231, at vane loading slot position) to the groove in the position shown in Fig.502A.

NOTE 1: Each of the two sets of three probe vanes is positioned to make two inspection ports.

NOTE 2: Compressor case front B925032 and B925036 may incorporate up to qty 4 off handed probe vanes (2-241 and 2-242), in lieu of standard probe vanes (2-240). These vanes should be assembled in the order shown in Fig.502A, to make two inspection ports.

SNECMA

- (b) Apply lubricant 'C' to the eight bolts (2-200), then secure each of the four bolted vanes (2-230) with two sleeves (2-210) and two bolts (2-200), inserting the bolts through the cutaways in the outer skin at the top and bottom of the case. Apply lubricant 'C' to the two bolts (2-201), then secure the bolted vane (2-231) at the vane loading slot position with two sleeves (2-211) and two bolts (2-201). Torque-tighten all bolts (2-200) to 210 lbf in. (24 Nm) and bolts (2-201) to 100 lbf in. (11,5 N.m). Then wire-lock the bolts together at each vane.
- (6) Compressor case front B925023 and B925024 with single probe access (Ref.Fig.502B).
- (a) Remove the stage 5 vanes from their container/platform (Tool 1373 and 1390), and with the trailing edge (shorter length) of the vane towards the rear (uppermost) end of the case, engage the vanes in the groove loading slot at the top of the case and ease them round in either direction. Assemble 87 vanes (2-220), four probe vanes (2-240), four bolted vanes (2-230) and one bolted vane (2-231, at vane loading slot position) to the groove in the position shown in Fig.502B.
- NOTE: Compressor case front B925023 and B926024 may incorporate up to qty 4 off handed probe vanes (2-241 and 2-242), in lieu of standard vanes (2-240). These vanes should be assembled in the order shown in Fig.502B, to make single inspection ports.
- (b) Apply lubricant 'C' to the eight bolts (2-200), then secure each of the four bolted vanes (2-230) with two sleeves (2-210) and two bolts (2-200), inserting the bolts through the cutaways in the outer skin at the top and bottom of the case. Apply lubricant 'C' to the two bolts (2-201), then secure the bolted vane (2-231) at the vane loading slot position with two sleeves (2-211) and two bolts (2-201). Torque tighten all bolts (2-200) to 210 lbf in. (24 Nm) and bolts (2-201) to 100 lbf in. (11,5 N.m). Then wire-lock the bolts together at each vane.

B. Assemble Stage 5 Probe Blank Plugs to Front Case.

- (1) Ensure that the probe vanes are correctly installed by inserting the probe checking pin (Tool 289) through the outer and inner skins and the holes in the vanes at both the left and right-hand sides of the case.
- (2) Assemble blanking plugs.
  - (a) Compressor case front with twin probe access. Apply lubricant 'A' to the four blanking plugs (4-300, 5-410), assemble a washer (4-310, 5-420) to each plug, then screw the plugs into the outer skin at the left-hand and right-hand sides of the case above the probe vanes. Torque-tighten the plugs to 65 lbf in. (7,3 Nm), then wire-lock each pair of plugs together.
  - (b) Compressor case front with single probe access. Apply lubricant 'A' to the two blanking plugs (4-300, 5-410), assemble a washer (4-310, 5-420) to each plug, then screw the plugs into the outer skin at the left-hand and right-hand sides of the case above the probe vanes. Torque-tighten the plugs to 65 lbf in. (7,3 Nm). Wire-locking of single probe access stage 5 blanking plugs to the stage 6 blanking plugs is carried out during HP compressor assembly. (72-33-00 Assembly).
- (3) Check that a shouldered pin (5-430) is assembled to the TOP position in both the front and rear flange of the compressor case. If the pins are not assembled, assemble as described in para.6.
- (4) Check that two pins are assembled to the left-hand side of the compressor case, below the engine horizontal centre line, at the stage 3 stator vane location. If the pins are not assembled, on engines to pre SB.72-10 assemble the retaining rings (4-80) to the pins (4-90), and on engines embodying SB.72-10 assemble the retaining rings to the pins (4-90B). Assemble the pins to the case as described in para.6.
- (5) On engines embodying Mod.7848 (part 2) check that a shouldered pin (5A-190) is assembled to the right-hand side of the compressor case, below the engine horizontal centre line, at the stage 3 stator vane location. If the pin is not assembled, assemble as described in para.6.

- (6) Place the pins described in paras.3, 4 and 5 in a freezing agent (Cardice) for approximately 20 minutes. Wearing protective gloves, remove each pin in turn from the freezing agent and assemble to its location in the case. Ensure the shoulders or retaining rings of pins do not protrude above the surface of the case.

#### 4. Assemble Items to Inner Fixing Rings (Ref.Fig.502)

##### A. Assemble Items to Stage 1 Rings.

- (1) Remove the assembled labyrinth ring/fixing ring (1-80/90) from its container (Tool 1441) and place on to a flat protected surface with the labyrinth extending upwards.
- (2) Identify the cutaway in the fixing ring and insert a bolt (1-40) into one of the holes from underneath, then using the sleeve (Tool 1321), assemble a retaining ring (1-20) to the groove in the bolt securing it in position. Assemble and secure a bolt to the remaining hole in the same manner.
- (3) Apply lubricant 'C' to two bolts (1-70), then insert the bolts into one of the pairs of holes in the rings from underneath. Assemble a retaining plate (1-60) to the bolts so that the flange of the plate locates on the labyrinth, then screw a nut (1-50) onto each bolt. Ensure that the minimum locking (run-down) torque of the nuts is 10 lbf in. (1,1 N.m), then torque-tighten the nuts to 100 lbf in. (11,5 N.m). After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 2.5 thread pitches beyond nut chamfer, the bolt must be renewed (Ref. SB.72-8259-153).
- (4) Assemble and secure a retaining plate to the two remaining two holed positions in the rings in the same manner (Ref.para.(3)). Place the rings in the appropriate part of container (Tool 1441).
- (5) On engines to SB.72-8694-297 standard, install anti-fret liners (Ref.Fig.503).
- (a) Assemble the front and rear anti-fret liners (1-94 and 1-96) to the inner fixing ring and clamp in position for peening using two restraining tools (Tool 3134).

OLYMPUS 593

MK.610-14-28  
OVERHAUL

sneema

- (b) Peen the ends of the liners with a soft metal drift, radiused at the end, then assemble the retaining protector (Tool 3136) to the fixing ring.

## B. Assemble Items to Stage 2 Rings.

- (1) Remove the assembled labyrinth ring/fixing ring (1-370/360) from its container (Tool 1441) and place on to a flat protected surface with the labyrinth extending upwards.
- (2) Identify the cutaway in the fixing ring and insert a bolt (1-320) into one of the holes from underneath, then using a sleeve (Tool 1321), assemble a retaining ring (1-300) to the groove in the bolt securing it in position. Assemble and secure a bolt to the remaining hole in the same manner.
- (3) Apply lubricant 'C' to two bolts (1-350), then insert the bolts into one of the pairs of holes in the rings from underneath. Assemble a retaining plate (1-340) to the bolts so that the flange of the plate locates on the labyrinth, then screw a nut (1-330) onto each bolt. Ensure that the minimum locking (run-down) torque of the nuts is 10 lbf in. (1,1 N.m), then torque-tighten the nuts to 100 lbf in. (11,5 N.m). After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 2.5 thread pitches beyond nut chamfer, the bolt must be renewed (Ref.SB.72-8259-153).
- (4) Assemble and secure a retaining plate to the two remaining two holed positions in the rings in the same manner (Ref.para.(3)). Place the ring in the appropriate part of container (Tool 1441).
- (5) On engines to SB.72-8694-297 standard, install anti-fret liners (Ref.Fig.503).
  - (a) Assemble the front and rear anti-fret liners (1-374 and 1-376) to the inner fixing ring and clamp in position for peening using two restraining tools (Tool 3134).

HP COMPRESSOR ROTOR - SUB-ASSEMBLY

1. General

- A. Prior to commencing the balancing, refer to 72-09-00 Assembly for general information on assembly.
- B. Two methods of balancing are described within this chapter, para.5 to 11 detail the procedures necessary for horizontal balancing using Avery equipment (72N 17) and para.12 to 18 detail the procedures necessary for vertical balancing using Schenck equipment (ZE 40). It is assumed that all adapters and retaining plates quoted in the vertical balance procedure have been balanced at manufacture.
- C. During the balancing procedure, reference will be made to the Illustrated Parts Catalogue (I.P.C.) to identify those items where the nomenclature does not positively identify them, due to the duplication of the titles e.g. blades, disks, spacer rings etc. When an item is a part of the breakdown of the text concerned, the item will be identified e.g. blade (1-180) the 1 referring to the I.P.C. Fig.No., and the 180 referring to the Item No. Where items from a different breakdown are introduced, the breakdown numbers will be quoted in addition e.g. blade (72-31-00/1-180).
- D. Throughout the text special tools are quoted by their Ref.No. e.g. (Tool 1234). For a complete list of tooling required for the mass moment weighing of blades, horizontal and vertical balancing procedures, and for the Manufacturers Part No., refer to Special Tools, Fixtures and Equipment Table 1002, 1003 and 1004 respectively.
- E. This chapter details the work necessary to static balance the individual stages of the rotor, to a degree of balance, that will ensure that the assembled rotor (within the HP compressor assembly), will be within an out of balance state that can be corrected to within the limits required for the complete HP compressor rotor.

OVERHAUL

- F. During the datum alignment check and balancing (as required), the spacer rings are allied to the disks attached to their rear faces i.e. stage 3-4 spacer ring to stage 4 disk, stage 4-5 spacer ring to stage 5 disk etc.
- G. All stages of disks are balanced with the blades assembled, and in addition, stages 3 to 7 require the spacer rings to be assembled. Balance on all stages is achieved by the interchange of blades.
- H. On completion of the balancing, all spacer rings; except the stage 2-3 spacer ring, will be removed from their respective disks, adhesive labels and adhesive residue removed from the blades with a suitable solvent. Disks 1 to 6 will have their blades assembled, though only disks 1 and 2 will have their blades locked in position. When the balancing is completed the disks/blades and spacer rings must be despatched to the HP compressor assembly (72-33-00 Assembly) for inclusion in the assembly.

## 2. Mass Moment Weigh the HP Compressor Rotor Blades

NOTE: The following procedure need not be carried out on the blades of any stage if all the original blades are undamaged and are to be assembled to the original disk of stages 1 and 2, or to the original disk/spacer assembly of stages 3 to 7.

- A. Prepare the (Avery 62N5) Scales for Mass Moment Weigh of Rotor Blades (Ref.Fig.501).
  - (1) Ensure that the scale is level.
  - (2) Position the locator (Tool 1273) on the end of the adapter arm (Tool 1272) slide, align the holes, then insert the two adapter arm cap screws into the holes in the locator and screw them into the slide.
  - (3) Position the adapter arm on the right-hand end of the scale arm and secure with the knurled nut of the scale.

OVERHAUL

- (4) Release the knurled screw of the slide and position the left-hand edge of the slide at the 10 in. (254 mm) mark. All blades of each stage are to be mass moment weighed with the slide set at this position.

NOTE: Fig.501 does not illustrate the slide in its correct position.

- (5) Select a blade from the stage to be weighed, then position the blade root fir-tree on the locator and adjust the slide arm to engage on the top of the blade root with the bottom edge of the blade parallel with the (scale) arm. Secure the slide arm, then adjust the locator screw to form a stop for the blade when it is centrally positioned over the scale arm. Secure the locator screw with its thumbnut, then remove the blade.
- (6) Balance out the weight of the adapter arm/locator so that the scale reads zero, by placing weight(s) on the (top) scale pan, and adjusting the position of the balancing weight of the scale.
- (7) Select a (known) weight to counter-balance the weight of the blade and place the weight on the (bottom) scale pan.

B. Carry Out Mass Moment Weigh of Rotor Blades.

- (1) Assemble a blade (of the stage to be weighed) to the locator/arm.
- (2) Calculate the mass moment weight of the blade to the nearest tenth oz in. (72 grm mm), by adding the weight indicated on the scale dial to the (known) weight on the (bottom) scale pan.
- (3) Record the weight of the blade on an adhesive label, remove the blade from the locator/arm and attach the label to the (tip) end of the blade. Mass moment weigh each blade in turn in the same manner.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (4) Remove the stage 5 vanes from their container/platform (Tool 1373 and 1390), and with the trailing edge (shorter length) of the blade towards the rear (uppermost) end of the case, engage the vanes in the groove loading slot at the top left-hand side of the case and ease them round in either direction. Assemble 86 vanes (2-220), six probe vanes (2-240) and four bolted vanes (2-230) to the groove in the position shown on Fig.502.

NOTE: Each of the two sets of three probe vanes are positioned to make two inspection holes.

- (5) Apply lubricant 'B' to the eight bolts (2-200), then secure each of the four bolted vanes with two sleeves (2-210) and two bolts (2-200), inserting the bolts through the cutaways in the outer skin at the top and bottom of the case. Torque-tighten the bolts between 60 and 65 lbf in. (6,78 and 7,34 N.m), then wire-lock the bolts together at each vane.

B. Assemble Stage 5 Probe Blank Plugs to Front Case.

- (1) Ensure that the probe vanes are correctly installed by inserting the probe checking pin (Tool 289) through the outer and inner skins and the holes in the vanes at both the left and right-hand sides of the case.
- (2) Apply lubricant 'B' to the four blanking plugs (4-300 and 5-410), assemble a washer (4-310 and 5-420) to each plug, then screw the plugs into the outer skin at the left and right-hand sides of the case above the probe vanes. Torque-tighten the plugs between 30 and 40 lbf in. (3,4 and 4,5 N.m), then wire-lock each pair of plugs together.
- (3) Check that a shouldered pin (5-430) is assembled to the TOP position in both the front and rear flange of the compressor case. If the pins are not assembled, assemble as described in para.6.

SUB-ASSEMBLY

72-33-01

Page 505

Nov 1/76

MK.610-14-28  
OVERHAUL

- (4) Check that two pins are assembled to the left-hand side of the compressor case, below the engine horizontal centre line, at the stage 3 stator vane location. If the pins are not assembled, on engines to pre SB.72-10 assemble the retaining rings (4-80) to the pins (4-90), and on engines embodying SB.72-10 assemble the retaining rings to the pins (4-90B). Assemble the pins to the case as described in para.6.
- (5) On engines embodying Mod.7848 (part 2) check that a shouldered pin (5A-190) is assembled to the right-hand side of the compressor case, below the engine horizontal centre line, at the stage 3 stator vane location. If the pin is not assembled, assemble as described in para.6.
- (6) Place the pins described in paras.3, 4 and 5 in a freezing agent (Cardice) for approximately 20 minutes. Wearing protective gloves, remove each pin in turn from the freezing agent and assemble to its location in the case. Ensure the shoulders or retaining rings of pins do not protrude above the surface of the case.

#### 4. Assemble Items to Inner Fixing Rings (Ref.Fig.501)

##### A. Assemble Items to Stage 1 Rings.

- (1) Remove the assembled labyrinth ring/fixing ring (1-80/90) from its container (Tool 1441) and place on to a flat protected surface with the labyrinth extending upwards.
- (2) Identify the single hole in the rings and insert a bolt (1-40) into the hole from underneath, then using the sleeve (Tool 1321), assemble a retaining ring (1-40) to the groove in the bolt securing it in position.
- (3) Apply lubricant 'B' to two bolts (1-70), then insert the bolts into one of the pairs of holes in the rings from underneath. Assemble a retaining plate (1-60) to the bolts so that the flange of the plate locates on the labyrinth, then screw a nut (1-50) onto each bolt. Ensure that the minimum locking (run-down) torque of the nuts is 3.5 lbf in. (0,4 N.m), then torque-tighten the nuts between 85 and 95 lbf in. (9,6 and 10,7 N.m).

OVERHAUL

- (2) If any of the remaining spacer rings are new they must be checked as follows:

NOTE: The spacer rings (stage 3-4, 4-5, 5-6 and 6-7) (and their disks) have 36 holes, 27 spaced as for 36 and the remaining 9 (evenly spaced) holes are offset. The spacers will be marked with a manufacture datum mark on the edge of each flange which can be ignored.

- (a) Examine the edge of the small dia. flange of the new spacer for a light spot 'L', then examine the edge of the disk that is assembled to the spacer (rear) larger dia. flange for a light spot 'L'. Place the spacer on the (correct) disk and position the light spot on the spacer as near diametrically opposite the light spot on the disk as the nine offset holes will allow.
- (b) Etch the datum marks on the edge of the large and small flange of the spacer in line with the datum mark on the disk (if the manufacture datum mark is incorrect), then obliterate the original datum marks (if incorrect).
- (3) If any disk is a new item, the datum hole and the datum No.1 blade will be marked on the disk edge at manufacture (Ref.Fig.502). Ensure that the datum hole of each disk is marked, and is in correct relationship with the No.1 blade slot.
- (4) Trace through the datum holes (of the old and/or new disks and spacer) from the stage 7 disk, stage 6-7 spacer ring etc. to the stage 1 disk and ensure that the No.1 blades of the disks are in line.

4. Check Balance of Balancing Mandrels used for Horizontal Balance

A. General.

- (1) The tolerances of the manufacture of the balancing mandrels are such that concentricity checks etc. are not required on the mandrels, but each mandrel must be dynamically balanced to within 1 dram in. (45 grm mm) prior to being used as a balancing mandrel. On the first occasion, and on any occasion it is deemed necessary, the mandrels listed in Table 501 must be balanced in accordance with the following procedure.

STAGE OF DISK	1	2	3	4	5	6	7
TOOL REF.NO. OF BALANCING MANDREL	371	546	1151	1115	1116	1114	552

Disk Balancing Mandrels  
Table 501

B. Prepare the Balancing Machine (Avery 7210) (Ref.Fig.503).

NOTE: With the Avery 7210 balancing machine, the bearings assembled to the cradles will be the correct size for the balancing mandrels, therefore no further bearing, spacers etc. will be required.

- (1) Position the left or right-hand edges of the bearings in the machine cradles (approx.) 11 or 14 in. (280 or 355 mm) apart to suit the mandrel to be balanced, by adjusting the position of the cradles. Lock the cradles and ensure that the cradle retaining arms are swung open.
- (2) Position the bottom half of the protection guard (Tool 1500) in between the cradles so that the left-hand side of the guard is approx. 0.5 in. (12 mm) from the left-hand cradle. Secure the guard to the bed of the balancing machine.

C. Assemble a Balancing Mandrel to the Balancing Machine  
(Ref.Fig.504).

- (1) Attach a hoist to the lifting fixture (Tool 1171), then position the fixture over the balancing mandrel and assemble the mandrel to the lifting fixture.
- (2) Position the hoist over the balancing machine with the studded end of the mandrel towards the balancing machine drive. Lower the mandrel into the bottom half of the protection guard, lift the balancing machine drive and engage the mandrel studs in it. Adjust the position of the cradles (if required) to align with the bearing journals of the mandrel, with the mandrel correctly engaged with the drive. Adjust the position of the guard (if required) to give running clearance of the mandrel, then secure the cradles and guard (if required). Lower the mandrel on to the cradles, then disengage the lifting fixture from the mandrel and the hoist.
- (3) Assemble washers and nuts to the mandrel studs and fully tighten the nuts. Pivot the retaining arms of the cradles over the mandrel and engage them around the pillars, then secure them with thumbnuts. Using a hoist lower the top half of the guard (Tool 1500) on to the bottom half, then pivot the bottom guard swing bolts into the top guard and secure with the thumbnuts.

D. Balance the Balancing Mandrel.

- (1) Apply lubricant 'A' to the spindles of the adjustable bearings and the journals of the mandrel, and ensure that they remain well lubricated throughout the balancing operation.

- PRINTED IN ENGLAND
- (2) Carry out dynamic balancing of the mandrel, operating the balancing machine in accordance with the manufacturers instructions. The mandrel should be rotated at (approx.) 450 rpm and run for (approx.) two to three min for the temperature to stabilise. The balance of the mandrel must be within 1 dram in. (45 grm mm). If the balance of the mandrel is outside the limits, balance out the right-hand end of the mandrel by slackening the axial grub screws in the end face of the mandrel and removing and/or re-positioning the radial grub screws in the right-hand flange (Ref.Fig.504 view 'C'). Re-secure the locking screws after adjustment. Balance out the left-hand end by adding plugs (1/4 UNF 28 T.P.I. x 1/4 in. long) and lockwashers to the studded flange at the left-hand end of the mandrel (Ref.Fig.504 view 'A').

NOTE: If a new mandrel is seriously out of balance it may be necessary to correct its static balance first, by grinding the bore of one or more of the lightening holes in the web of the mandrel.

E. Remove the Balance Mandrel from the Balancing Machine.

- (1) Release the retaining arm of each cradle and pivot the arms out of the way. Release and pivot down the swing bolts securing the top half of the guard, then using a hoist, raise the guard until clear of the mandrel and lower on to a suitable surface. Remove the hoist from the guard.
- (2) Attach a hoist to the lifting fixture (Tool 1171), then position and lower the hoist over the mandrel and engage the two hooks of the fixture around the mandrel. Remove the nuts and washers securing the mandrel to the balancing machine drive. Raise the hoist and guide the mandrel out of the guard, and when possible, disengage the drive from the mandrel studs and lower the drive.
- (3) Position and lower the mandrel into its storage stand, then remove the fixture from the mandrel and the hoist.

5. Balance the Stage 1 Rotor

NOTE: If all the original blades are available and undamaged and are to be assembled to the original disk, the bladed disk does not require balancing, but the blades must be assembled to the disk with serviceable retaining plates (1-220) as detailed in para.B and F.

A. Apply Dry Film Lubricant (Engines to SB 72-8879-338 standard only) (Ref.Fig.504A).

- (1) Apply one coat of dry film lubricant to the loaded flanks of the stage 1 rotor blades as instructed in Chapter 72-09-18 Repair.
- (2) Apply two coats of dry film lubricant to the stage 1 disk root serrations, with a minimum drying time of 10 minutes between coats, as instructed in Chapter 72-09-18 Repair.

B. Assemble Blades to Stage 1 Disk and Prepare for Balance (Ref.Fig.505).

- (1) Ensure that a Hydraclamp (Tool 1673) is bolted to a pedestal (Tool 1674), then position the mounting plate (Tool 1163) on the Hydraclamp and secure with its slave bolts. Position the mounting plate so that its axis is horizontal, then lock the Hydraclamp.
- (2) Connect a hoist to the lifting eye of the lifting fixture (Tool 1171), then position the hoist over the static balance mandrel (Tool 371) and assemble the mandrel to the lifting fixture.
- (3) Position the hoist alongside the mounting plate, then traverse the hoist and engage the balancing mandrel over the mounting plate, ensuring that the mandrel studs locate in the holes in the mounting plate. Assemble washers and nuts to the mandrel studs and fully tighten the nuts.
- (4) Position and adjust the support stand (Tool 1667) to support the end of the balancing mandrel. Disconnect the lifting fixture from the mandrel, and the fixture from the hoist. Insert the retaining bolt (Tool 547) into the end of the mandrel and when it contacts the mounting plate, screw it into the plate. Attach a hoist to the ring of the bolt, then release the Hydraclamp and raise/traverse the hoist to bring the mandrel to the vertical position. Lock the Hydraclamp, then release the hoist.

- (5) Assemble the lifting fixture (Tool 369) to the stage 1 disk (1-230) (Ref.Fig.506).
- (a) Attach a hoist to the lifting ring of the fixture, then position the hoist over the disk.
  - (b) Raise the disk by positioning three suitable support blocks under the disk, ensuring that the blocks are evenly positioned.
  - (c) Ensure that the hand knobs are engaged in the holes at the 'FREE' position. Lower the hoist and engage the plate in the disk, then withdraw each hand knob from its locking hole, turn the knobs to the 'LOCK' position engaging the claws under the disk, and release the knobs engaging them in the lock holes.
- (6) Assemble the disk to the balancing mandrel (Ref. Fig.506).
- (a) Raise the hoist and position the disk over the balancing mandrel. Align the bolt holes of the disk with the mandrel locating/securing studs, ensuring that the offset datum hole of the disk is not aligned with the studs.
  - (b) Lower the disk on to the studs, ensuring that it is lowered squarely and does not get jammed. Lightly tap with a suitable (soft faced) mallet if necessary. When the disk abuts the mandrel, screw the special nuts onto the studs and fully tighten the nuts.
  - (c) Withdraw each hand knob from its locking hole, turn the knobs to the 'FREE' position and engage them in the locking holes. Raise the fixture from the disk, then remove the the fixture from the hoist.

OVERHAUL

- (7) Attach a hoist to the ring of the retaining bolt, then release the Hydraclamp and lower the mandrel to the horizontal position. Position the support stand (Tool 1667) under the end of the mandrel to take the weight, then remove the hoist and unscrew and remove the retaining bolt.
- (8) Assemble the blades to the stage 1 disk (Ref.Fig.507).

NOTE: If the disk is to SB.72-34 standard, only blade positions No.1 and 34 will be marked on the edge of the disk.

- (a) Ensure that the two handles of the mandrel are withdrawn from engagement in the retaining plate and the plate is turned to the unlocked position allowing the blades to be assembled to the disk.

NOTE: If all the original blades are available and undamaged, then assemble the blades as detailed in para.(b). If the blades include four repaired and/or new blades, then the blades must be assembled as detailed in para.(c). If the blades include more than four repaired and/or new blades, then the blades must be assembled as detailed in para.(d). Ensure that the aggregate depth of blending of repaired blades does not exceed 0.90 in. (22,86 mm) (Ref.72-33-02 Repair No.6).

- (b) Identify the stage 1 blades (1-210), then examine the blade roots for their positional No. (Ref.Fig.502) and lay the blades out in numerical sequence. Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades, then insert the blades in numerical sequence into the disk, starting at No.1 position and working in a clockwise direction when viewing the mandrel side of the disk.

PRINTED IN ENGLAND

TN11270

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (c) Identify the stage 1 blades (1-210), then examine the roots of the original blades for their positional No. (Ref.Fig.502) and lay the blades out in numerical sequence, leaving spaces where new blades are to be positioned. Noting the mass moment weight of the new blades, place the lightest new blades in vacant positions next to the heaviest original blades, and position the heaviest new blades in vacant positions next to the lightest original blades. Assemble the blades to the disk as detailed in para.(b).
- (d) Identify the stage 1 blades (1-210), then according to the mass moment weight of the blades (quoted on the labels), lay the blades out in sequence of weight, starting with the heaviest blade at one end and ending with the lightest blade at the other end. Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades (Ref.Fig.502). Assemble the blades to the disk positioning the heaviest blade at No.1 position and the next heaviest blade diametrically opposite, then assemble the two lightest blades diametrically opposite each other and next to the heaviest blades. Assemble the remainder of the blades to the disk in sequence of weight, assembling alternate heavy and light blades and where possible, positioning equal weight blades diametrically opposite each other.
- (e) Turn the retaining plate to lock the blades in position and ensure that the two handle plungers engage in the plate locking it in position.

C. Assemble the Stage 1 Bladed Disk to the Balancing Machine.

- (1) Attach a hoist to the lifting eye of the lifting fixture (Tool 1171), then position the hoist over the balancing mandrel and engage the two hooks of the fixture around the mandrel.
- (2) Remove the nuts and washers securing the mandrel to the mounting plate, then remove the support stand and traverse the hoist to disengage the mandrel from the mounting plate. If the mandrel/disk cannot be assembled direct to the balancing machine, lower it into the mobile stand (Tool 1165) engaging the mandrel journals in the stand support brackets (Ref. Fig.508). Disconnect the lifting fixture, then position the stand near the balancing machine. With the lifting fixture (Tool 1171) attached to a hoist, position the hooks of the fixture around the mandrel and raise it out of the stand.
- (3) Position the hoist over the balancing machine with the studded end of the mandrel towards the balancing machine drive. Lower the disk into the bottom half of the protection guard (Tool 1500), lift the balancing machine drive and engage the mandrel studs in it, then adjust the position of the cradles (if necessary) to align with the bearing journals of the mandrel, with the mandrel correctly engaged with the drive. Adjust the guard position (if necessary) to give running clearance of the mandrel/bladed disk, then secure the cradles and guard (if required). Lower the mandrel on to the cradles, then disengage the lifting fixture from the mandrel and the hoist.
- (4) Assemble washers and nuts to the mandrel studs and fully tighten the nuts. Pivot the retaining arms of the cradles over the mandrel and engage them around the pillars, then secure them with thumbnuts. Using a hoist, lower the top half of the guard (Tool 1500) onto the bottom half ensuring that the access cover of the guard is towards the balancing machine operator. Pivot the bottom guard swing bolts into the top guard and secure with the thumbnuts.

**D. Balance the Stage 1 Bladed Disk.**

- (1) Apply Lubricant 'A' to the spindles of the adjustable bearings and the journals of the mandrel, and ensure that they remain well lubricated throughout the balancing operation.
- (2) Carry out a static balance of the bladed disk, operating the balancing machine in accordance with the manufacturers instructions. The disk should be rotated at (approx.) 450 rpm and run for (approx.) two to three min. for the temperature to stabilise. The balance of the disk must be within 4 drn in. (180 grm mm). If the balance of the disk is outside the limit, rectify by the interchange of heavy and light-weight blades (Ref. para.(3)) from the out of balance angular position, until the disk is within limits.
- (3) To exchange the blades, release the swing bolts securing the top half of the guard and using a hoist, remove the guard. Withdraw the two handle plungers locking the mandrel retaining plate, then turn the plate to release the blades. Withdraw a heavy blade from as near the out of balance position as possible and exchange it for a light blade as near diametrically opposite as possible. Turn the retaining plate to lock the blades in position and ensure that the two handle plungers engage in the plate locking holes. Lower the top half of the guard on to the bottom half and secure the top with the swing bolts. Release the hoist. Recheck the balance of the bladed disk.

**E. Remove the Bladed Disk from the Balancing Machine.**

- (1) Release the retaining arm of each cradle and pivot the arms out of the way. Release and pivot down the swing bolts securing the top half of the guard, then using a hoist, raise the guard until clear of the disk and lower on to a suitable surface. Remove the hoist from the guard.

- (2) Attach a hoist to the lifting fixture (Tool 1171), then position and lower the hoist over the disk and engage the two hooks of the fixture around the mandrel. Remove the nuts and washers securing the mandrel to the balancing machine drive. Raise the hoist and guide the disk out of the machine, and when possible, disengage the drive from the mandrel studs and lower the drive.
- (3) If the mandrel/disk cannot be assembled direct to the Hydraclamp, lower it into the mobile stand (Tool 1165) engaging the mandrel journals in the stand support brackets (Ref.Fig.508). Disconnect the lifting fixture, then position the stand by the Hydraclamp. With the lifting fixture (Tool 1171) attached to a hoist, position the hooks of the fixture around the mandrel and raise it out of the stand.
- (4) Position the hoist alongside the Hydraclamp, then engage the mandrel over the mounting plate and insert the studs through the plate. Assemble the mandrel washers and nuts on to the studs and fully tighten the nuts.
- (5) Position the support stand (Tool 1667) under the end of the mandrel, then disconnect the lifting fixture from the mandrel and the fixture from the hoist. Insert the retaining bolt (Tool 547) into the end of the mandrel and screw it into the mounting plate.
- (6) Attach a hoist to the ring of the retaining bolt, then release the Hydraclamp and raise/traverse the hoist to position the mandrel vertically. Lock the Hydraclamp, then release the hoist.

**F. Secure the Blades to the Stage 1 Disk.**

- (1) Assemble the lifting fixture (Tool 369) to the disk (Ref.Fig.506).
  - (a) Attach a hoist to the lifting ring of the fixture, then position the hoist over the disk.

OVERHAUL

- (b) Ensure that the hand knobs are engaged in the holes of the 'FREE' position. Lower the hoist and engage the plate in the disk, then withdraw each hand knob from its locking hole, turn the knobs to the 'LOCK' position engaging the claws under the disk, and release the knobs engaging them in the lock holes.
- (2) Remove the disk from the balancing mandrel and assemble it to the blading mandrel (Tool 370).
- (a) Remove the special nuts securing the disk to the mandrel, then assemble a protection/retaining band (Tool 1130) to the tips of the blades.
- (b) Raise the hoist and withdraw the disk from the mandrel studs, lightly tapping the disk with a (soft faced) hammer (if required). Position and lower the disk on to a suitable surface, then disconnect the hoist and lower the fixture on to the disk.
- (c) Attach a hoist to the ring of the retaining bolt, then release the Hydraclamp and lower the mandrel to the horizontal position. Position the support stand (Tool 1667) under the end of the mandrel to take the weight, then remove the hoist and unscrew and remove the retaining bolt.
- (d) Attach a hoist to the lifting eye of the lifting fixture (Tool 1171), then position the hoist over the balancing mandrel and engage the two hooks of the fixture around the mandrel. Remove the nuts and washers securing the mandrel to the mounting plate, then remove the support stand and traverse the hoist to disengage the mandrel from the mounting plate. Position and lower the mandrel into its storage stand, then remove the lifting fixture from the mandrel.

OVERHAUL

- (3) Remove the protection/retaining band from the blade tips. Examine the edge of the disk for the No.1 blade datum mark  $\rightarrow 0$ , then examine the blade roots for their numbering (Ref.Fig.502) and ensure that all the blades are numbered correctly in numerical sequence in a clockwise direction as viewed from the mandrel side, with No.1 blade in the datum slot. Etch all new blades with their position No., and renumber any blades that have been re-positioned, ensuring that old position No. are obliterated.
- (4) Remove No.1 blade from its slot, assemble a retaining plate (1-220) to the groove in the end face, then refit the blade/plate to the disk (Ref.Fig.509). Ensure that the blade is fully in, then using the hammer (Tool 1655), bend the protruding end of the retaining plate against the disk. Ensure that the retaining plate is bent over the edge of the disk, but care must be taken that the bend of the plate is not too acute causing a fracture of the plate. Assemble a retaining plate to each of the blades, and lock each plate against the disk. Using feeler gauges, check each blade to ensure that the maximum end-float of the blade root in the disk does not exceed 0.015 in. (0,38 mm). Assemble the protection/retaining band (Tool 1130) to the tips of the blades.
- (5) Attach a hoist to the ring of the retaining bolt, then release the Hydraclamp and raise/traverse the hoist to position the mandrel vertically. Lock the Hydraclamp, then release the hoist.
- (6) Assemble the lifting fixture (Tool 369) to the disk (Ref.Fig.506).
  - (a) Attach a hoist to the lifting ring of the fixture, then position the hoist over the disk.

This Temporary Revision complies with BCAR's Chapter A6-2 and TSS No.0-2

*David Handell*

For Chief Technical and Industrial Services Engineer CAA Design Approval No.DA1/8566/78

TEMPORARY REVISION NO.72-572

Insert in 72-33-02 after page 528

REASON FOR ISSUE

BEOL NOTE added

ACTION

Read the following NOTE after paragraph E (3)

BEOL NOTE: To avoid re-etching, note on a blade card the original position number (as etched on the blade root against the position assembled to in the disc after balancing). This will enable the reassembly of the blades to their correct positions should they come out of the disc after balancing. Applicable to H.P. stage 1-7 rotor assemblies.

OVERHAUL

- (b) Ensure that the hand knobs are engaged in the holes at the 'FREE' position. Lower the hoist and engage the plate in the disk, then withdraw each hand knob from its locking hole, turn the knobs to the 'LOCK' position engaging the claws under the disk, and release the knobs engaging them in the lock holes.
- (7) Remove the nuts and washers securing the disk to the mandrel, then raise the hoist and position and lower the disk on to a suitable pallet or container. Withdraw each hand knob of the fixture from its locking hole, turn the knobs to the 'FREE' position and engage them in the locking holes. Raise the fixture from the disk, then remove the fixture from the hoist.

NOTE: The stage 1 bladed disk is now ready to be passed to the HP Compressor Assembly (72-33-00 Assembly).

- (8) Remove the blading mandrel from the Hydraclamp.
- (a) Attach a hoist to the ring of the retaining bolt, release the Hydraclamp, then lower the mandrel on to the support stand. Release the hoist, then remove the retaining bolt.
- (b) Attach a hoist to the lifting eye of the lifting fixture (Tool 1171), then position the hoist over the blading mandrel and engage the two hooks of the fixture around the mandrel.
- (c) Remove the nuts and washers securing the mandrel to the mounting plate, then remove the support stand and traverse the hoist to disengage the mandrel from the mounting plate. Position and lower the mandrel into its storage stand, then remove the lifting fixture from the mandrel and the hoist. Assemble the washers and nuts to the mandrel and the hoist. Assemble the washers and nuts to the mandrel studs, and the special nuts to the mandrel locating/securing studs.

## 6. Balance the Stage 2 Rotor

NOTE: If all the original blades are available and undamaged and are to be assembled to the original disk, the bladed disk does not require balancing, but the blades must be assembled to the disk with serviceable retaining plates (1-220) as detailed in para.A.and E.(4) to (8).

### A. Assemble Blades to Stage 2 Disk and Prepare for Balancing.

- (1) Ensure that a Hydraclamp (Tool 1673) is bolted to a pedestal (Tool 1674), and the mounting plate (Tool 1163) is bolted to the Hydraclamp. Position the mounting plate in the horizontal position, then lock the Hydraclamp.
- (2) Connect a hoist to the lifting eye of the lifting fixture (Tool 1171), then position the hoist over the static balance mandrel (Tool 546) and assemble the mandrel to the lifting fixture.
- (3) Position the hoist alongside the mounting plate (Ref.Fig.505), then traverse the hoist and engage the balancing mandrel over the mounting plate, ensuring that the mandrel studs locate in the holes in the mounting plate. Assemble washers and nuts to the mandrel studs and fully tighten the nuts.
- (4) Position and adjust the support stand (Tool 1667) to support the end of the balancing mandrel. Disconnect the lifting fixture from the mandrel, and the fixture from the hoist. Insert the retaining bolt (Tool 547) into the end of the mandrel and when it contacts the mounting plate, screw it into the plate. Attach a hoist to the ring of the bolt, then release the Hydraclamp and raise/traverse the hoist to bring the mandrel to the vertical position. Lock the Hydraclamp, then release the hoist.

OVERHAUL

- (5) Assemble the multiple leg sling (Tool 1173) to the stage 2 disk (1-300) (Ref.Fig.510).
  - (a) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.
  - (b) Ensure that the knurled nuts are unscrewed and the claws turned to align them with the plate. Lower the hoist and engage the plate in the disk, then turn the claws outwards to engage them under the disk. Tighten the knurled nuts to lock the claws in position.
- (6) Assemble the disk to the balancing mandrel (Ref. Fig.510).
  - (a) Raise the hoist and position the disk over the balancing mandrel. Align the bolt hole at the datum blade slot with one of the two mandrel locating/securing studs aligned with 'SLOT NO.1' in the mandrel edge.
  - (b) Lower the disk over the studs, ensuring that it is lowered squarely and does not get jammed. Lightly tap with a suitable (soft faced) mallet if necessary. When the disk abuts the mandrel, screw the special nuts on to the studs and fully tighten the nuts.
  - (c) Release the knurled nuts of the sling, turn the claws sideways, then raise the sling from the disk. Remove the sling from the hoist.
- (7) Attach a hoist to the ring of the retaining bolt, then release the Hydraclamp and lower the mandrel to the horizontal position. Position the support stand (Tool 1667) under the end of the mandrel to take the weight, then remove the hoist and unscrew and remove the retaining bolt.

OVERHAUL

- (8) Assemble the blades to the stage 2 disk (Ref.Fig.511).

NOTE: If the disk is to SB.72-34 standard, only blade positions No.1 and 54 will be marked on the edge of the disk.

- (a) Ensure that the two handles of the mandrel are withdrawn from engagement in the retaining plate and the plate is turned to the unlocked position allowing the blades to be assembled to the disk.

NOTE: If all the original blades are available and undamaged, then assemble the blades as detailed in para.(b). If the blades include six repaired and/or new blades, then the blades must be assembled as detailed in para.(c). If the blades include more than six repaired and/or new blades then the blades must be assembled as detailed in para.(d). Ensure that the aggregate depth of blending of repaired blades does not exceed 1.50 in. (38,10 mm) (Ref.72-33-02 Repair No.6).

- (b) Identify the stage 2 blades (1-280), then examine the blade roots for their positional No. (Ref.Fig.502) and lay the blades out in numerical sequence. Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades, then insert the blades in numerical sequence into the disk, starting at No.1 position and working in a clockwise direction when viewing the mandrel side of the disk.
- (c) Identify the stage 2 blades (1-280), then examine the roots of the original blades for their positional No. (Ref.Fig.502) and lay the blades out in numerical sequence, leaving spaces where new blades are to be positioned. Noting the mass moment weight of the new blades, place the lightest new blades in vacant positions next to the heaviest original blades, and position the heaviest new blades in vacant positions next to the lightest original blades. Assemble the blades to the disk as detailed in para.(b).

MK.610-14-28

OVERHAUL

PRINTED IN ENGLAND

- (d) Identify the stage 2 blades (1-280), then according to the mass moment weight of the blades (quoted on the labels), lay the blades out in sequence of weight, starting with the heaviest blade at one end and ending with the lightest blade at the other end. Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades (Ref.Fig.502). Assemble the blades to the disk positioning the heaviest blade at No.1 position and the next heaviest blade diametrically opposite, then assemble the two lightest blades diametrically opposite each other and next to the heaviest blades. Assemble the remainder of the blades to the disk in sequence of weight, assembling alternate heavy and light blades and where possible, positioning equal weight blades diametrically opposite each other.
- (e) If the disk is to SB 72-8925-358 standard, check that there is at least 0.010 in. (0,25 mm) side-ways movement at the tip of each blade, to ensure adequate clearance in disk slots coated with Sermetel 709.
- (f) Turn the retaining plate to lock the blades in position and ensure that the two handle plungers engage in the plate locking the blades.

**B. Assemble the Stage 2 Bladed Disk to the Balancing Machine.**

- (1) Attach a hoist to the lifting eye of the lifting fixture (Tool 1171), then position the hoist over the balancing mandrel and engage the two hooks of the fixture around the mandrel.
- (2) Remove the nuts and washers securing the mandrel to the mounting plate, then remove the support stand and traverse the hoist to disengage the mandrel from the mounting plate. If the mandrel/disk cannot be assembled direct to the balancing machine, lower it into the mobile stand (Tool 1165) engaging the mandrel journals in the stand support brackets (Ref.Fig.508). Disconnect the lifting fixture, then position the stand near the balancing machine. With the lifting fixture (Tool 1171) attached to a hoist, position the hooks of the fixture around the mandrel and raise it out of the stand.

SUB-ASSEMBLY  
**72-33-02**

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (3) Position the hoist over the balancing machine with the studded end of the mandrel towards the balancing machine drive. Lower the disk into the bottom half of the protection guard (Tool 1500), lift the balancing machine drive and engage the mandrel studs in it, then adjust the position of the cradles (if required) to align with the bearing journals of the mandrel, with the mandrel correctly engaged with the drive. Adjust the guard position (if required) to give running clearance of the mandrel/bladed disk, then secure the cradles and guard (if necessary). Lower the mandrel on to the cradles, then disengage the lifting fixture from the mandrel and hoist.
- (4) Assemble washers and nuts to the mandrel studs and fully tighten the nuts. Pivot the retaining arms of the cradles over the mandrel and engage them around the pillars, then secure them with thumbnuts. Using a hoist, lower the top half of the guard (Tool 1500) on to the bottom half ensuring that the access cover of the guard is towards the balancing machine operator. Pivot the bottom guard swing bolts into the top guard and secure with the thumbnuts.

C. Balance the Stage 2 Bladed Disk.

- (1) Apply lubricant 'A' to the spindles of the adjustable bearings and the journals of the mandrel, and ensure they remain well lubricated throughout the balancing operations.
- (2) Carry out a static balance of the bladed disk, operating the balancing machine in accordance with the manufacturers instructions. The disk should be rotated at (approx.) 450 rpm and run for (approx.) two to three min for the temperature to stabilise. The balance of the disk must be within 4 grm in. (180 grm mm). If the balance of the disk is outside the limit, rectify by the interchange of heavy and light-weight blades (Ref. para. (3) to (5)) from the out of balance angular position, until the disk is within limits.

SUB-ASSEMBLY

**72-33-02**

Page 536

Jun 1/90

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (3) To exchange the blades, release the swing bolts securing the top half of the guard and using a hoist, remove the guard. Withdraw the two handle plungers locking the mandrel retaining plate, then turn the plate to release the blades. Withdraw a heavy blade from as near the out of balance position as possible and exchange it for a light blade from as near diametrically opposite as possible.
- (4) If the disk is to SB 72-8925-358 standard, check that there is at least 0.010 in. (0,25 mm) sideways movement at the tip of each blade.
- (5) Turn the retaining plate to lock the blades in position and ensure that the two handle plungers engage in the plate locking holes. Lower the top half of the guard on to the bottom half and secure the top with the swing bolts. Release the hoist. Recheck the balance of the bladed disk.

D. Remove the Bladed Disk from the Balancing Machine.

- (1) Release the retaining arm of each cradle and pivot the arms out of the way. Release and pivot down the swing bolts securing the top half of the guard, then using a hoist, raise the guard until clear of the disk and lower on to a suitable surface. Remove the hoist from the guard.
- (2) Attach a hoist to the lifting fixture (Tool 1171), then position and lower the hoist over the disk and engage the two hooks of the fixture around the mandrel. Remove the nuts and washers securing the mandrel to the balancing machine drive. Raise the hoist and guide the disk out of the machine, and when possible, disengage the drive from the mandrel studs and lower the drive.
- (3) If the mandrel/disk cannot be assembled direct to the Hydraclamp, lower it into the mobile stand (Tool 1165) engaging the mandrel journals in the stand support brackets (Ref.Fig.508). Disconnect the lifting fixture, then position the stand by the Hydraclamp. With the lifting fixture (Tool 1171) attached to a hoist, position the hooks of the fixture around the mandrel and raise it out of the stand.

SUB-ASSEMBLY  
**72-33-02**

Page 537

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (4) Position the hoist alongside the Hydraclamp, then engage the mandrel over the mounting plate and insert the studs through the plate. Assemble the mandrel washers and nuts on to the studs and fully tighten the nuts.
- (5) Position the support stand (Tool 1667) under the end of the mandrel, then disconnect the lifting fixture from the mandrel and the fixture from the hoist. Insert the retaining bolt (Tool 547) into the end of the mandrel and screw it into the mounting plate.
- (6) Attach a hoist to the ring of the retaining bolt, then release the Hydraclamp and raise/traverse the hoist to position the mandrel vertically. Lock the Hydraclamp, then release the hoist.

E. Secure the Blades to the Stage 2 Disk.

- (1) Assemble the multiple leg sling (Tool 1173) to the stage 2 disk (Ref.Fig.510).
  - (a) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.
  - (b) Ensure that the knurled nuts are unscrewed and the claws turned to align with the plate. Lower the hoist and engage the plate in the disk, then turn the claws outwards to engage them under the disk. Tighten the knurled nuts to lock the claws in position.
- (2) Remove the disk from the balancing mandrel and assemble it to the blading mandrel (Tool 545).
  - (a) Remove the special nuts securing the disk to the mandrel, then assemble a protection/retaining band (Tool 1130) to the tips of the blades.

SUB-ASSEMBLY

72-33-02

Page 538

Nov 1/76

OLYMPUS 593

OVERHAUL

- (b) Raise the hoist and withdraw the disk from the mandrel studs, lightly tapping the disk with a (soft faced) hammer (if required). Position and lower the disk onto a suitable surface, then disconnect the hoist and lower the sling on to the disk.
- (c) Attach a hoist to the ring of the retaining bolt, then release the Hydraclamp and lower the mandrel to the horizontal position. Position the support stand (Tool 1667) under the end of the mandrel to take the weight, then remove the hoist and unscrew and remove the retaining bolt.
- (d) Attach a hoist to the lifting eye of the lifting fixture (Tool 1171), then position the hoist over the balancing mandrel and engage the two hooks of the fixture around the mandrel. Remove the nuts and washers securing the mandrel to the mounting plate, then remove the support stand and traverse the hoist to disengage the mandrel from the mounting plate. Position and lower the mandrel into its storage stand, then remove the lifting fixture from the mandrel.
- (e) Position the hoist over the blading mandrel (Tool 545) and assemble the mandrel to the lifting fixture. Position the hoist alongside the mounting plate, then traverse the hoist and engage the blading mandrel over the mounting plate, ensuring that the mandrel studs locate in the holes in the mounting plate. Assemble the washers and nuts to the mandrel studs and fully tighten the nuts (Ref.Fig.512).
- (f) Position and adjust the support stand (Tool 1667) to support the end of the blading mandrel. Disconnect the lifting fixture from the mandrel, and the fixture from the hoist. Insert the retaining bolt (Tool 547) into the end of the mandrel and when it contacts the mounting plate, screw it into the plate. Attach a hoist to the ring of the bolt, then release the Hydraclamp and raise/traverse the hoist to bring the mandrel to the vertical position. Lock the Hydraclamp, then release the hoist.

SUB-ASSEMBLY

MK.610-14-28

OVERHAUL

- (g) Attach a hoist to the ring of the multiple lug sling (Tool 1173), then raise the disk and position it over the mandrel. Align the disk bolt holes with the mandrel studs, then lower the disk into the mandrel. Assemble washers and nuts to the studs and fully tighten the nuts. Release the knurled nuts of the sling, turn the claws sideways, then raise the sling from the disk. Remove the sling from the hoist.
- (h) Attach a hoist to the ring of the retaining bolt, then release the Hydraclamp and lower the mandrel to the horizontal position. Position the support stand (Tool 1667) under the end of the mandrel to take the weight, then remove the hoist.
- (3) Remove the protection/retaining band from the blade tips. Examine the edge of the disk for the No.1 blade datum mark  $\rightarrow 0$ , then examine the blade roots for their numbering (Ref.Fig.502) and ensure that all the blades are numbered correctly in numerical sequence in a clockwise direction as viewed from the mandrel side, with No.1 blade in the datum slot. Etch all new blades with their position No., and renumber any blades that have been re-positioned, ensuring that all old numbers are obliterated.
- (4) Remove No.1 blade from its slot, assemble a retaining plate (1-290) to the groove in the end face, then refit the blade/plate to the disk (Ref.Fig.512). Ensure that the blade is fully in, then using the hammer (Tool 1655), bend the protruding end of the retaining plate against the disk. Ensure that the retaining plate is bent over the edge of the disk, but care must be taken that the bend of the plate is not too acute causing a fracture of the plate. Assemble a retaining plate to each of the blades, and lock each plate against the disk. Using feeler gauges, check each blade to ensure that the maximum end-float of the blade root in the disk does not exceed 0.015 in. (0,38 mm). Assemble the protection/retaining band (Tool 1130) to the tips of the blades.

- (5) Attach a hoist to the ring of the bolt, then release the Hydraclamp and raise/traverse the hoist to bring the mandrel to the vertical position. Lock the Hydraclamp, then release the hoist.
  - (6) Assemble the multiple leg sling (Tool 1173) to the disk (Ref.Fig.510).
    - (a) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.
    - (b) Ensure that the knurled nuts are unscrewed and the claws turned to align them with the plate. Lower the hoist and engage the plate in the disk, then turn the claws outwards to engage them under the disk. Tighten the knurled nuts to lock the claws in position.
  - (7) Remove the nuts and washers securing the disk to the mandrel, then raise the hoist and position and lower the disk on to a suitable pallet or container. Release the knurled nuts of the sling, turn the claws sideways, then raise the sling from the disk. Remove the sling from the hoist.
- NOTE: The stage 2 bladed disk is now ready to be passed to the HP Compressor Assembly (72-33-00 Assembly).
- (8) Remove the blading mandrel from the Hydraclamp.
    - (a) Attach a hoist to the ring of the retaining bolt, release the Hydraclamp, then lower the mandrel on to the support stand. Release the hoist, then remove the retaining bolt.
    - (b) Attach a hoist to the lifting eye of the lifting fixture (Tool 1171), then position the hoist over the blading mandrel and engage the two hooks of the fixture around the mandrel.

TN11274

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (c) Remove the nuts and washers securing the mandrel to the mounting plate, then remove the support stand and traverse the hoist to disengage the mandrel from the mounting plate. Position and lower the mandrel into its storage stand, then remove the lifting fixture from the mandrel and the hoist. Assemble the washers and nuts to the mandrel studs, and the special nuts to the mandrel locating/securing studs.

7. Balance the Stage 3 Rotor and Stage 2-3 Spacer Ring

NOTE: If all the original blades are available and undamaged and are to be assembled to the original disk/spacer, the bladed disk/spacer does not require balancing, but the spacer and blades must be assembled to the disk as detailed in para.A, B and F.

A. Assemble the Stage 2-3 Spacer Ring to the Stage 3 Disk.

- (1) Assemble a locating pin (Tool 607) to each of the three supports (Tool 608) and space the supports on a suitable clean flat surface.
- (2) Assemble the multiple leg sling (Tool 1173) to the stage 3 disk (1-350) (Ref.Fig.513).
  - (a) Raise the disk by positioning three suitable support blocks under the disk, ensuring that the blocks are evenly positioned.
  - (b) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.
  - (c) Ensure that the knurled nuts are unscrewed, and the claws are turned to align them with the plate. Lower the hoist and engage the plate in the disk, then turn the claws outwards to engage them under the disk. Tighten the knurled nuts to lock the claws.

OVERHAUL

- (3) Raise the hoist and position the disk over the three supports (Tool 608). Evenly dispose the supports under the disk and align the pins with the bolt holes. Lower the disk over the pins and rest it on the supports.
- (4) Release the knurled nuts of the sling, turn the claws sideways, then raise the sling from the disk. Remove the sling from the hoist.
- (5) Ensure that the heater (Tool 757) (Ref.Fig.514) is positioned on its mobile stand (Tool 759) with its handles uppermost, then attach the multiple leg sling (Tool 1645) to the holes in the three handles with the sling shackle pins. Attach a hoist to the lifting eye of the sling, then position and lower the heater over the stage 3 disk ensuring that it is concentric with the disk.
- (6) Heat the disk to 70 deg.C by operating the heater control (Tool 758) (Ref.Fig.514).

NOTE: If the heater, control or stand are not available, use suitable units based on the wiring diagram (Ref.Fig.514).

- (a) Connect the heater control input supply plug to a suitable mains supply connection and turn the mains switch 'ON'.
- (b) Turn the three 'HEATER CONTROLS' band switches to 'FULL'.
- (c) Turn the heater time controller to nine minutes.
- (d) Switch the 'HEATERS' toggle switch to 'ON', then press the 'TIMER START' pushbutton to start the heating cycle. During the period the heater is on, the 'ON' indicator light will be remain illuminated and at the completion of nine minutes the heaters and light will automatically be switched off.

- (e) When the timer switch cuts out, switch the 'HEATERS' toggle switch to 'OFF', the 'HEATER CONTROLS' switches to 'OFF' and the mains supply switch to 'OFF'.
- (f) Remove the heater from the disk and position and lower it on to its stand. Release the hoist and lower the sling on to the heater, taking care not to touch the heater unless protective gloves are worn.

NOTE: The multiple leg sling (Tool 1645) is also used for lifting mechanical pullers in addition to the heater. If only one sling is available, the operator must assemble and remove the sling from the heater each time it is used.

- (7) Note the position of the datum hole in line with the datum mark→O on the edge of the blade roots at the No.1 blade position of the stage 3 disk, and the datum mark→O on the edge of the flange of the stage 2-3 spacer ring (1-330) (Ref.Fig.502). Position the spacer ring over the disk, align the datum marks on both items and lower the spacer over the locating pins and on to the disk. Ensure that the spacer abuts the disk, then allow the disk to cool.

B. Assemble Blades to Stage 3 Disk and Prepare for Balance (Ref.Fig.515 and 516).

- (1) Ensure that a Hydraclamp (Tool 1673) is bolted to a pedestal (Tool 1674), and the mounting plate (Tool 1163) is bolted to the Hydraclamp (Ref.Fig.505). Position the mounting plate so that its axis is horizontal, then lock the Hydraclamp.
- (2) Connect a hoist to the lifting eye of the lifting fixture (Tool 1171), then position the hoist over the static balance mandrel (Tool 1151) and assemble the mandrel to the lifting fixture.

SUB-ASSEMBLY

- (3) Position the hoist alongside the mounting plate, then traverse the hoist and engage the balancing mandrel over the mounting plate, ensuring that the mandrel studs locate in the holes in the mounting plate. Assemble washers and nuts to the mandrel studs and fully tighten the nuts.
- (4) Position and adjust the support stand (Tool 1667) to support the end of the balancing mandrel. Disconnect the lifting fixture from the mandrel and the fixture from the hoist. Insert the retaining bolt (Tool 547) into the end of the mandrel and when it contacts the mounting plate, screw it into the plate. Attach a hoist to the ring of the bolt, then release the Hydraclamp and raise/traverse the hoist to bring the mandrel to the vertical position. Lock the Hydraclamp, then release the hoist.
- (5) Assemble the multiple leg sling (Tool 1173) to the stage 3 disk (Ref.Fig.513).
  - (a) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.
  - (b) Ensure that the knurled nuts are unscrewed and the claws turned to align them with the plate. Lower the hoist and engage the plate in the disk, then turn the claws outwards to engage them under the disk. Tighten the knurled nuts to lock the claws in position.
- (6) Assemble the stage 3 disk/spacer to the balancing mandrel.
  - (a) Raise the hoist and ensure that the locating pins are disengaged from the disk, then position the hoist over the balancing mandrel.
  - (b) Correctly position the disk relative to the mandrel locating/securing studs, then lower the disk over the studs, ensuring that it is lowered squarely and does not get jammed. Lightly tap with a suitable (soft faced) mallet if necessary. When the disk abuts the mandrel, screw the special nuts on to the studs and fully tighten the nuts.

TN9943

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (c) Release the knurled nuts of the sling, turn the claws sideways, then raise the sling from the disk. Remove the sling from the hoist.
- (7) Attach a hoist to the ring of the retaining bolt, then release the Hydraclamp and lower the mandrel to the horizontal position. Position the support stand (Tool 1667) under the end of the mandrel to take the weight, then remove the hoist and unscrew and remove the retaining bolt.
- (8) Assemble the blades to the stage 3 disk.

NOTE: If all the original blades are available and undamaged, then assemble the blades as detailed in para.(a). If the blades include six repaired and/or new blades, then the blades must be assembled as detailed in para.(b). If the blades include more than six repaired and/or new blades then the blades must be assembled as detailed in para.(c). Ensure that the aggregate depth of blending of repaired blades does not exceed 1.20 in. (30,48 mm) (Ref.72-33-02 Repair No.6).

- (a) Identify the stage 3 blades (1-340), then examine the blade roots for their positional No. (Ref.Fig.502) and lay the blades out in numerical sequence. Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades, then insert the blades in numerical sequence into the disk, starting at No.1 position and working in a clockwise direction when viewing the mandrel side of the disk.

OLYMPUS 593

- (2) Remove the nuts securing the mandrel to the mounting plate, then remove the support stand and traverse the hoist to disengage the mandrel from the mounting plate. If the mandrel/disk cannot be assembled direct to the balancing machine, lower it into the mobile stand (Tool 1165) engaging the mandrel journals in the stand support brackets (Ref.Fig.508). Disconnect the lifting fixture, then position the stand near the balancing machine. With the lifting fixture (Tool 1171) attached to a hoist, position the hooks of the fixture around the mandrel and raise it out of the stand.
- (3) Position the hoist over the balancing machine with the studded end of the mandrel towards the balancing machine drive. Lower the disk into the bottom half of the protection guard (Tool 1500). Lift the balancing machine drive and engage the mandrel studs in it, then adjust the position of the cradles (if necessary) to align with the bearing journals of the mandrel, with the mandrel correctly engaged with the drive. Adjust the guard position (if necessary) to give running clearance of the mandrel/bladed disk, then secure the cradles and guard (if required). Lower the mandrel on to the cradles, then disengage the lifting fixture from the mandrel and the hoist.
- (4) Assemble washers and nuts to the mandrel studs and fully tighten the nuts. Pivot the retaining arms of the cradles over the mandrel and engage them around the pillars, then secure them with thumbnuts. Using a hoist, lower the top half of the guard (Tool 1500) on to the bottom half ensuring that the access cover of the guard is towards the balancing machine operator. Pivot the bottom guard swing bolts into the top guard and secure with the thumbnuts.

OVERHAUL

D. Balance the Stage 3 Bladed Disk/Spacer Ring.

- (1) Apply lubricant 'A' to the spindles of the adjustable bearings and the journals of the mandrel, and ensure that they remain well lubricated throughout the balancing operation.
- (2) Carry out a static balance of the bladed disk, operating the balancing machine in accordance with the manufacturers' instructions. The disk should be rotated at (approx.) 450 rpm and run for (approx.) two to three min for the temperature to stabilise. The balance of the disk must be within 4 drn in. (180 grm mm). If the balance of the disk is outside the limits, rectify by the interchange of heavy and light weight blades (Ref. para.(3)) from the out of balance angular position, until the disk is within limits.
- (3) To exchange the blades, hinge open the access cover, release the masking tape then withdraw a heavy blade from as near the out of balance position as possible and exchange it for a light blade from as near diametrically opposite as possible. If the disk is to SB 72-8925-358 standard, check that there is at least 0.010 in. (0,25 mm) sideways movement at the tip of each blade. Replace the masking tape and close the access cover. Recheck the balance of the bladed disk/spacer ring.

E. Remove the Bladed Disk/Spacer Ring from the Balancing Machine and Number the Blades.

- (1) Release the retaining arm of each cradle and pivot the arms out of the way. Release and pivot down the/swing bolts securing the top half of the guard, then using a hoist, raise the guard until clear of the disk and lower on to a suitable surface. Remove the hoist from the guard.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (2) Attach a hoist to the lifting fixture (Tool 1171), then position and lower the hoist over the disk and engage the two hooks of the fixture around the mandrel. Remove the nuts and washers securing the mandrel to the balancing machine drive. Raise the hoist and guide the disk out of the machine, and when possible, disengage the drive from the mandrel studs and lower the drive.
- (3) If the mandrel/disk cannot be assembled direct to the Hydraclamp, lower it into the mobile stand (Tool 1165) engaging the mandrel journals in the stand support brackets (Ref.Fig.508). Disconnect the lifting fixture, then position the stand by the Hydraclamp. With the lifting fixture (Tool 1171) attached to a hoist, position the hooks of the fixture around the mandrel and raise it out of the stand.
- (4) Position the hoist alongside the Hydraclamp, then engage the mandrel over the mounting plate and insert the studs through the plate. Assemble the mandrel washers and nuts to the studs and fully tighten the nuts.
- (5) Position the support stand (Tool 1667) under the end of the mandrel, then disconnect the lifting fixture from the mandrel and the fixture from the hoist. Insert the retaining bolt (Tool 547) into the end of the mandrel and screw it into the mounting plate.
- (6) Remove the masking tape from the blade roots. Examine the edge of the disk for the No.1 blade datum mark→0, then examine the blade roots for their numbering (Ref.Fig.502) and ensure that all the blades are numbered correctly in numerical sequence in a clockwise direction as viewed from the mandrel side, with No.1 blade in the datum slot. Etch all new blades with their position No., and renumber any blades that have been re-positioned, ensuring that all old position No. are obliterated. Replace the masking tape over the blade roots.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

F. Remove the Bladed Disk/Spacer Ring from the Balancing Mandrel (Ref.Fig.515).

NOTE: The stage 2-3 spacer ring is not normally removed from the stage 3 disk. If for some reason it is desired to separate the two, remove the spacer whilst the disk is still attached to the balancing mandrel. Use the mechanical puller (Tool 457), thrust bolts (Tool 458) and slave bolts (Tool 460) to remove the spacer, and stow the spacer in its container (Tool 1441). Refer to para.A. for the assembly of the spacer ring to the disk.

- (1) Attach a hoist to the ring of the retaining bolt, then release the Hydraclamp and raise/traverse the hoist to position the mandrel vertically. Lock the Hydraclamp, then release the hoist.
- (2) Unscrew and remove the mandrel nuts from the spacer ring.
- (3) Assemble the multiple leg sling (Tool 1173) to the disk.
  - (a) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk/spacer.
  - (b) Ensure that the knurled nuts are unscrewed, and the claws are turned to align them with the plate. Lower the hoist and engage the plate in the disk, then turn the claws outwards to engage them under the disk. Tighten the knurled nuts to lock the claws.
- (4) Raise the hoist and withdraw the disk/spacer from the mandrel studs, lightly tapping the disk with a (soft faced) mallet (if required). Position and lower the disk/spacer on to a suitable pallet or container. Release the knurled nuts of the sling, turn the claws sideways, then raise the sling from the disk and remove the sling from the hoist. Assemble the protection/retaining band (Tool 1130) to the tips of the blades.

NOTE: The stage 3 bladed disk/spacer assembly is now ready to be passed to the HP Compressor Assembly (72-33-00 Assembly).

- (5) Remove the balancing mandrel from the Hydraclamp.
- (a) Attach a hoist to the ring of the retaining bolt, release the Hydraclamp, then lower the mandrel on to the support stand. Release the hoist, then remove the retaining bolt.
  - (b) Attach a hoist to the lifting eye of the lifting fixture (Tool 1171), then position the hoist over the balancing mandrel and engage the two hooks of the fixture around the mandrel.
  - (c) Remove the nuts and washers securing the mandrel to the mounting plate, then remove the support stand and traverse the hoist to disengage the mandrel from the mounting plate. Position and lower the mandrel into its storage stand, then remove the lifting fixture from the mandrel and the hoist. Assemble the washers and nuts to the mandrel studs, and the special nuts to the mandrel locating/securing studs.

8. Balance the Stage 4 Rotor and Stage 3-4 Spacer Ring

NOTE: If all the original blades are available and undamaged and are to be assembled to the original disk/spacer, the bladed disk/spacer does not require balancing, but the blades must be assembled to the disk as detailed in para.B and G.

A. Assemble the Stage 3-4 Spacer Ring to the Stage 4 Disk.

- (1) Assemble the spacer ring (1-380) to the disk (2-20) as detailed in para.7.A with the difference that the locating pin (Tool 606) must be used instead of (Tool 607) (Ref.para.(1)).

B. Assemble Blades to Stage 4 Disk and Prepare for Balance.

- (1) Assemble the disk to the balancing mandrel and the blades (2-10) to the disk as detailed in para.7.B, with the difference that the balancing mandrel (Tool 1115) must be used instead of (Tool 1151) (Ref.para.(2)), and the 'NOTE' (Ref.para.(8)) reads as follows:

NOTE: If all the original blades are available and undamaged, then assemble the blades as detailed in para.(a). If the blades include eight repaired and/or new blades, then the blades must be assembled as detailed in para.(b). If the blades include more than eight repaired and/or new blades, then the blades must be assembled as detailed in para.(c). Ensure that the aggregate depth of blending of repaired blades does not exceed 1.68 in. (42,67 mm) (Ref.72-33-02 Repair No.6).

C. Assemble the Stage 4 Bladed Disk/Spacer Ring to the Balancing Machine.

- (1) Assemble the bladed disk to the balancing machine as detailed in para.7.C.

D. Balance the Stage 4 Bladed Disk/Spacer Ring.

- (1) Balance the bladed disk/spacer as detailed in para.7.D. to within 4 grm in. (180 grm mm) by the interchange of blades.

E. Remove the Bladed Disk/Spacer Ring from the Balancing Machine and Number the Blades.

- (1) Remove the bladed disk/spacer from the balancing machine and number the blades as detailed in para.7.E.

F. Remove the Stage 3-4 Spacer Ring from the Stage 4 Disk  
(Ref.Fig.517).

- (1) Attach a hoist to the ring of the retaining bolt, then release the Hydraclamp and raise/traverse the hoist to position the mandrel vertically. Lock the Hydraclamp, then release the hoist.
- (2) Attach a hoist to the multiple leg sling (Tool 1645), then position the hoist over the mechanical puller (Tool 471) and secure the sling to the puller eye bolts with shackles. Ensure that the puller thrust bolts are unscrewed.
- (3) Unscrew and remove the mandrel nuts from the spacer ring. Position and lower the puller, guiding the thrust pins through the bolt holes in the spacer, and rest the pins on the disk. Insert the nine securing pins (Tool 474), into the holes in the puller plate, then insert the nine slave bolts (Tool 475) into the front flange of the spacer and screw the securing pins on to them. Ensure that the flats on the slave bolts locate correctly, and that the pins are tightened.
- (4) Screw in on the thrust bolts until the play on the top plate is taken up, then separate the spacer from the disk by screwing in the thrust bolts in equal progressive increments until the items are separated.
- (5) Raise the hoist and position and lower the spacer ring on to a suitable clean flat surface. Unscrew the securing pins and remove the slave bolts. Raise the hoist and position and lower the puller on to a suitable surface, then release and remove the sling from the puller and hoist. Stow the spacer ring into its correct slot in the container (Tool 1441).

G. Remove the Bladed Disk from the Balancing Mandrel.

- (1) Remove the bladed disk from the balancing mandrel as detailed in para.7.F.(3) and (4).

NOTE: The stage 4 bladed disk and stage 3-4 spacer ring are now ready to be passed to the HP Compressor Assembly (72-33-00 Assembly).

9. Balance the Stage 5 Rotor and Stage 4-5 Spacer Ring

NOTE: If all the original blades are available and undamaged and are to be assembled to the original disk/spacer, the bladed disk/spacer does not require balancing, but the blades must be assembled to the disk as detailed in para.B and G.

A. Assemble the Stage 4-5 Spacer Ring to the Stage 5 Disk.

- (1) Assemble the spacer ring (2-50) to the disk (2-70) as detailed in para.7.A. with the difference that the locating pin (Tool 606) must be used instead of (Tool 607) (Ref.para.(1)).

B. Assemble Blades to Stage 5 Disk and Prepare for Balance.

- (1) Assemble the disk to the balancing mandrel and the blades (2-60) to the disk as detailed in para.7.B., with the difference that the balancing mandrel (Tool 1116) must be used instead of (Tool 1151) (Ref.para.(2)), and the 'NOTE' (Ref.para.(8)) reads as follows:

NOTE: If all the original blades are available and undamaged, then assemble the blades as detailed in para.(a). If the blades include nine repaired and/or new blades, then the blades must be assembled as detailed in para.(b). If the blades include more than nine repaired and/or new blades, then the blades must be assembled as detailed in para.(c). Ensure that the aggregate depth of blending of repaired blades does not exceed 1.92 in. (48,76 mm) (Ref.72-33-02 Repair No.6).

D. Balance the Stage 6 Bladed Disk/Spacer Ring.

- (1) Balance the bladed disk/spacer as detailed in para.7.D. to within 4 drmm in. (180 grmm mm) by the interchange of blades.

E. Remove the Bladed Disk/Spacer Ring from the Balancing Machine and Number the Blades.

- (1) Remove the bladed disk/spacer from the balancing machine and number the blades as detailed in para.7.E.

F. Remove the Stage 5-6 Spacer Ring from the Stage 6 Disk.

- (1) Remove the spacer ring from the disk as detailed in para.8.F. with the difference that the mechanical puller (Tool 473) must be used instead of (Tool 471) (Ref.para.(2)).

G. Remove the Bladed Disk from the Balancing Mandrel.

- (1) Remove the bladed disk from the balancing mandrel as detailed in para.7.F.(3) and (4).

NOTE: The stage 6 bladed disk and stage 5-6 spacer ring are now ready to be passed to the HP Compressor Assembly (72-33-00 Assembly).

11. Balance the Stage 7 Rotor and Stage 6-7 Spacer Ring

NOTE: If all the original blades are available and undamaged and are to be assembled to the original disk/spacer, the balancing of the bladed disk/spacer is not required and para.11. need not be carried out.

A. Assemble the Stage 6-7 Spacer Ring to the Stage 7 Disk.

- (1) Assemble a locating pin (Tool 604) to each of the three supports (Tool 608) and place the supports on a suitable clean, flat surface.

TN25500

- (2) Assemble the multiple leg sling (Tool 1173) to the stage 7 disk (3-370).
- (a) Raise the disk by positioning three suitable support blocks under the disk, ensuring the blocks are evenly positioned.
  - (b) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.
  - (c) Ensure that the knurled nuts are unscrewed, and the claws turned to align them with the plate. Lower the hoist and engage the plate in the disk, then turn the claws outwards to engage them under the disk. Tighten the knurled nuts to lock the claws in position.
- (3) Raise the hoist and position the disk over the three supports (Tool 608). Evenly dispose the supports under the disk and align the pins with the inner ring of holes. Lower the disk over the pins and rest it on the supports.
- (4) Release the knurled nuts of the sling, turn the claws sideways, then raise the sling from the disk. Remove the sling from the hoist.
- (5) Ensure that the heater (Tool 757) (Ref.Fig.514) is positioned on its mobile stand (Tool 759) with its handles uppermost and the multiple leg sling (Tool 1645) is assembled to the holes in the three handles with the sling shackle pins. Attach a hoist to the lifting eye of the sling, then position and lower the heater over stage 7 disk ensuring that it is concentric with the disk.
- (6) Heat the disk to 70 deg.C by operating the heater control (Tool 758) in accordance with para.7.A.(6). On completion of its heating cycle, remove the heater from the disk and position and lower it on to its stand. Release the hoist and lower the sling on to the heater, taking care not to touch the heater unless protective gloves are worn.

- (7) Note the position of the datum hole in line with the datum mark → 00 ← on the edge of the outer (inward facing) flange of the stage 6-7 spacer ring (3-390), and the datum hole in line with the datum mark → 0 on the blade roots at the No.1 blade position (Ref.Fig.502). Position the spacer ring over the disk, then align the datum marks on both items and lower the spacer ring over the locating pins and on to the disk. Ensure that the spacer abuts the disk, then allow the disk to cool.

B. Preparation for Balancing the Stage 7 Disk/Stage 6-7 Spacer Ring.

- (1) Ensure that a Hydraclamp (Tool 1673) is bolted to a pedestal (Tool 1674), and the mounting plate (Tool 1163) is bolted to the Hydraclamp. Position the mounting plate so that its axis is horizontal, then lock the Hydraclamp.
- (2) Connect a hoist to the lifting eye of the lifting fixture (Tool 1171), then position the hoist over the static balance mandrel (Tool 552) and assemble the mandrel to the lifting fixture.
- (3) Position the hoist alongside the mounting plate, then traverse the hoist and engage the balancing mandrel over the mounting plate, ensuring that the mandrel studs locate in the holes in the mounting plate. Assemble washers and nuts to the mandrel studs and fully tighten the nuts.
- (4) Position and adjust the support stand (Tool 1667) to support the end of the balancing mandrel. Disconnect the lifting fixture from the mandrel, and the fixture from the hoist. Insert the retaining bolt (Tool 547) into the end of the mandrel and when it contacts the mounting plate, screw it into the plate. Attach a hoist to the ring of the bolt, then release the Hydraclamp and raise/traverse the hoist to bring the mandrel to the vertical position. Lock the Hydraclamp, then release the hoist.

- (5) Assemble the multiple leg sling (Tool 1173) to the stage 7 disk.
- (a) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.
  - (b) Ensure that the knurled nuts are unscrewed, and the claws turned to align them with the plate. Lower the hoist and engage the plate in the disk, then turn the claws outwards to engage them under the disk. Tighten the knurled nuts to lock the claws in position.
- (6) Assemble the stage 7 disk/stage 6-7 spacer to the balancing mandrel (Ref.Fig.518).
- (a) Raise the hoist and ensure that the locating pins are disengaged from the disk, then position the hoist over the balancing mandrel.
- NOTE: Due to the nine (equally spaced) offset bolt holes, the disk can only be assembled to the mandrel in a certain position.
- (b) Correctly position the disk relative to the mandrel locating/securing studs, then lower the disk over the studs, ensuring that it is lowered squarely and does not get jammed. Lightly tap with a suitable (soft faced) mallet (if necessary). When the disk abuts the mandrel, screw the special nuts on to the studs and fully tighten the nuts.
  - (c) Release the knurled nuts of the sling, turn the claws sideways, then raise the sling from the disk. Remove the sling from the hoist.
- (7) Attach a hoist to the ring of the retaining bolt, then release the Hydraclamp and lower the mandrel so that its axis is horizontal (Ref.Fig.519). Position the support stand (Tool 1667) under the end of the mandrel to take the weight, then remove the hoist and unscrew and remove the retaining bolt.

- (8) Attach a hoist to the lifting eye of the lifting fixture (Tool 1171), then position the hoist over the balancing mandrel and engage the two hooks of the fixture around the mandrel.
- (9) Remove the nuts and washers securing the mandrel to the mounting plate, then remove the support stand and traverse the hoist to disengage the mandrel from the mounting plate. If the mandrel/disk assembly cannot be assembled to the balancing machine direct, lower it into the mobile stand (Tool 1165) engaging the mandrel journals in the stand support brackets. Disconnect the lifting fixture, then position the stand adjacent to the balancing machine. With the lifting fixture (Tool 1171) attached to a hoist, position the hooks of the fixture around the mandrel and raise it out of the stand.
- (10) Position the hoist over the balancing machine with the studded end of the mandrel towards the balancing machine drive. Lower the disk into the bottom half of the protection guard (Tool 1500), lift the balancing machine drive and engage the mandrel studs in it, then adjust the position of the cradles (if necessary) to align with the bearing journals of the mandrel, with the mandrel correctly engaged with the drive. Adjust the guard position (if necessary) to give running clearance of the mandrel/disk, then secure the cradles and guard. Lower the mandrel on to the cradles, then disengage the lifting fixture from the mandrel and the hoist.
- (11) Assemble washers and nuts to the mandrel studs and fully tighten the nuts. Pivot the retaining arms of the cradles over the mandrel and engage them around the pillars, then secure them with thumbnuts. Using a hoist, lower the top half of the guard (Tool 1500) on to the bottom half ensuring that the access cover of the guard is towards the balancing machine operator. Pivot the bottom guard swing bolts into the top guard and secure with the thumbnuts.

C. Balance the Stage 7 Disk/Stage 6-7 Spacer Ring.

- (1) Apply lubricant 'A' to the spindles of the adjustable bearings and the journals of the mandrel, and ensure that they remain well lubricated throughout the balancing operation.
- (2) Carry out a static balance of the disk/spacer, operating the balancing machine in accordance with the manufacturers instructions. The disk/spacer should be rotated at (approx.) 450 rpm and run for (approx.) two to three min for the temperature to stabilise. The balance of the disk/spacer must be within 2 drmm in. (90 grm mm). If the balance is outside the limit, rectify by adding plasticine to the disk face at the outer ring bolt hole location, in line with the out of balance angular position. Gain access to the disk face by hinging open the access cover. Identify the plasticine as balance No.1.

D. Remove the Disk/Spacer Ring from the Balancing Machine.

- (1) Release the retaining arm of each cradle and pivot the arms out of the way. Release and pivot down the swing bolts securing the top half of the guard, then using a hoist, raise the guard until clear of the disk and lower on to a suitable surface. Remove the hoist from the guard.
- (2) Attach a hoist to the lifting fixture (Tool 1171), then position and lower the fixture over the disk and engage the two hooks of the fixture around the mandrel. Remove the nuts and washers securing the mandrel to the balancing machine drive. Raise the hoist and guide the disk out of the machine, and when possible, disengage the drive from the mandrel studs and lower the drive.
- (3) If the mandrel/disk cannot be assembled to the Hydraclamp direct, lower it into the mobile stand (Tool 1165) engaging the mandrel journals in the stand support brackets. Disconnect the lifting fixture, then position the stand adjacent to the Hydraclamp. With the lifting fixture (Tool 1171) attached to a hoist, position the hooks of the fixture around the mandrel and raise it out of the stand.

- (4) Position the hoist alongside the Hydraclamp, then engage the mandrel over the mounting plate and insert the studs through the plate. Assemble the washers and nuts to the mandrel studs and fully tighten the nuts.
- (5) Position the support stand (Tool 1667) under the end of the mandrel, then disconnect the lifting fixture from the mandrel and the fixture from the hoist.
- (6) Insert the retaining bolt (Tool 547) into the end of the mandrel and screw it into the mounting plate. Attach a hoist to the ring of the retaining bolt, then release the Hydraclamp and raise/traverse the hoist to position the mandrel vertically. Lock the Hydraclamp then release the hoist.

E. Remove the Stage 6-7 Spacer Ring from the Stage 7 Disk (Ref.Fig.520).

- (1) Attach a hoist to the multiple leg sling (Tool 1645), then position the hoist over the mechanical puller (Tool 976) and secure the sling to the puller eye bolts with shackles.
- (2) Unscrew and remove the mandrel nuts from the spacer ring. Position and lower the mechanical puller over the spacer ring and align the puller extractor pins with the bolt holes in the spacer. Ensure that the pawls of the extractor pins spring out from the pins, and that the knurled nuts are unscrewed. Lower the puller on to the spacer ensuring that the pins enter the spacer bolt holes. Push the pins into the spacer until the pawls spring out and engage behind the spacer, then pull up on the pins and tighten the knurled locknuts, ensuring that the pawls of all the pins are located and locked underneath the spacer ring.

OVERHAUL

- (3) Screw in on the six jacking screws until they contact the disk, then separate the spacer from the disk by screwing in the jacking screws in equal progressive increments until the items are separated.
- (4) Raise the hoist and position and lower the spacer ring on to a suitable clean flat surface. Release the mechanical puller extractor pin knurled locknuts, press the pawls into the pins, then withdraw the pins from the spacer ring. Raise the mechanical puller and lower on to a suitable surface, then release and remove the multiple leg sling from the puller, and the sling from the hoist.
- (5) Screw the nuts on to the mandrel studs to secure the disk to the mandrel.

F. Assemble the Stage 7 Disk to the Balancing Machine.

- (1) Attach a hoist to the ring of the retaining bolt, then release the Hydraclamp and lower/traverse the hoist and rest the end of the mandrel on the support stand (Tool 1667). Release the hoist, then unscrew and remove the retaining bolt.
- (2) Attach a hoist to the lifting fixture (Tool 1171), then position the hoist above the disk and engage the two hooks of the fixture around the mandrel.
- (3) Remove the nuts and washers securing the mandrel to the mounting plate, then remove the support stand and traverse the hoist to disengage the mandrel from the mounting plate. Position the disk above the balancing machine. If the hoist cannot move direct to the balancing machine, lower the mandrel/disk into the mobile stand (Tool 1165), transport it to the area concerned, then using the lifting equipment, lift the mandrel/disk from the stand.

OVERHAUL

- (4) Lower the disk into the bottom half of the protection guard (Tool 1500), lift the balancing machine drive and engage the mandrel studs in it. Check that the cradles and guard are correctly aligned with the journals of the mandrel and the disk (adjust if necessary), then lower the mandrel on to the cradles. Disengage the lifting fixture from the mandrel, then remove the fixture from the hoist.
- (5) Assemble washers and nuts to the mandrel studs and fully tighten the nuts. Pivot the retaining arms of the cradles over the mandrel and engage them around the pillars, then secure them with thumbnuts. Using a hoist, lower the top half of the guard (Tool 1500) on to the bottom half ensuring that the access cover of the guard is towards the balancing machine operator. Pivot the bottom guard swing bolts into the top guard and secure with the thumbnuts.

G. Balance the Stage 7 Disk.

- (1) Apply lubricant 'A' to the spindles of the adjustable bearings and the journals of the mandrel, and ensure that they remain well lubricated throughout the balancing operation.
- (2) Carry out a static balance of the disk, operating the balancing machine in accordance with the manufacturers instructions. The disk should be rotated at (approx.) 450 rpm and run for (approx.) two to three min for the temperature to stabilise. The balance of the disk must be within 2 drn in. (90 grm mm). If the balance is outside the limit, rectify by adding plasticine to the disk face at the outer ring bolt hole location, in line with the out of balance angular position. Do not touch the balance No.1 plasticine, and identify the second lump of plasticine as balance No.2. Gain access to the disk face by hinging open the access cover.

OVERHAUL

H. Remove the Stage 7 Disk from the Balancing Machine and Assemble Blades to the Disk.

- (1) Remove the stage 7 disk from the balancing machine and assemble to the Hydraclamp as detailed in para.D.(1) to (5).
- (2) Assemble blades to the stage 7 disk.

NOTE: If all the original blades are available and undamaged, then assemble the blades as detailed in para.(a). If the blades include 12 repaired and/or new blades, then the blades must be assembled as detailed in para.(b). If the blades include more than 12 repaired and/or new blades then the blades must be assembled as detailed in para.(c). Ensure that the aggregate depth of blending of repaired blades does not exceed 2.40 in. (60,96 mm) (Ref.72-33-02 Repair No.6).

- (a) Identify the stage 7 blades (3-360), then examine the blade roots for their positional No. (Ref.Fig.502) and lay the blades out in numerical sequence. Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades, then insert the blades in numerical sequence into the front face of the disk, starting at No.1 position and working in a clockwise direction when viewing the rear (mandrel) side of the disk. Attach masking tape to the front face of the disk over the blade roots.
- (b) Identify the stage 7 blades (3-360), then examine the roots of the original blades for their positional No. (Ref.Fig.502) and lay the blades out in numerical sequence, leaving spaces where new blades are to be positioned. Noting the mass moment weight of the new blades, place the lightest new blades in vacant positions next to the heaviest original blades, and position the heaviest new blades in vacant positions next to the lightest original blades. Assemble the blades to the disk as detailed in para.(a).

- (c) Identify the stage 7 blades (3-360), then according to the mass moment weight of the blades (quoted on the labels), lay the blades out in sequence of weight, starting with the heaviest blade at one end and ending with the lightest blade at the other end. Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades (Ref. Fig.502). Assemble the blades into the front face of the disk positioning the heaviest blade at No.1 position and the next heaviest blade diametrically opposite, then assemble the two lightest blades diametrically opposite each other and next to the heaviest blades. Assemble the remainder of the blades to the disk in sequence of weight, assembling alternate heavy and light blades and where possible, positioning equal weight blades diametrically opposite each other. Attach masking tape to the front face of the disk over the blade roots.

J. Assemble the Stage 7 Bladed Disk to the Balancing Machine and Balance the Disk.

- (1) Assemble the stage 7 bladed disk to the balancing machine as detailed in para.F.(2) to (5).
- (2) Apply lubricant 'A' to the spindles of the adjustable bearings and the journals of the mandrel, and ensure that they remain well lubricated throughout the balancing operation.
- (3) Remove the balance No.1 lump of plasticine, then carry out a static balance of the bladed disk, operating the balancing machine in accordance with the manufacturers instructions. The disk should be rotated at (approx.) 450 rpm and run for (approx.) two to three min for the temperature to stabilise. The balance of the disk must be within 2 drn in. (90 grm mm). If the balance of the disk is outside the limit, rectify by the interchange of heavy and light weight blades (Ref. para.(4)) from the out of balance angular position, until the disk is within limits.

- (4) To exchange the blades, hinge open the access cover, release the masking tape then withdraw a heavy blade from as near the out of balance position as possible and exchange it for a light blade from as near diametrically opposite as possible. Replace the masking tape and close the access cover.
- K. Remove the Stage 7 Bladed Disk from the Balancing Machine and Assemble the Stage 6-7 Spacer Ring to the Disk.
- (1) Remove the stage 7 bladed disk from the balancing machine and assemble to the Hydraclamp as detailed in para.D.(1) to (6).
  - (2) Assemble a locating pin (Tool 604) to each of the three supports (Tool 608) and place the supports on a suitable clean flat surface.
  - (3) Assemble the multiple leg sling (Tool 1173) to the disk.
    - (a) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.
    - (b) Ensure that the knurled nuts are unscrewed, and the claws are turned to align them with the plate. Lower the hoist and engage the plate in the disk, then turn the claws outwards to engage them under the disk. Tighten the knurled nuts to lock the claws.
  - (4) Unscrew and remove the mandrel nuts securing the disk. Raise the hoist and withdraw the disk from the mandrel studs, lightly tapping the disk with a (soft faced) mallet (if required). Position the disk over the three supports (Tool 608), evenly dispose the three supports under the disk to align the pins with the inner ring of holes. Lower the disk over the pins and rest it on the supports.

- (5) Release the knurled nuts of the sling, turn the claws sideways, then raise the sling from the disk. Remove the sling from the hoist. Remove the masking tape from the front (top) face of the disk and ensure that the disk and blade roots are perfectly clean.
- (6) Ensure that the heater (Tool 757) is positioned on its mobile stand (Tool 759) with its handles uppermost and the multiple leg sling (Tool 1645) is assembled to the holes in the three handles with the sling shackle pins. Attach a hoist to the lifting eye of the sling, then position and lower the heater over stage 7 disk ensuring that it is concentric with the disk.
- (7) Heat the disk to 70 deg.C by operating the heater control (Tool 758) in accordance with para.7.A.(6). On completion of its heating cycle, remove the heater from the disk and position and lower it on to its stand. Release the hoist and lower the sling on to the heater, taking care not to touch the heater unless protective gloves are worn. When the heater is cool release and remove the sling from the heater.
- (8) Note the position of the datum hole in line with the datum mark → OO ← on the edge of the outer (inward facing) flange of the stage 6-7 spacer ring, and the datum hole in line with the datum mark → O on the blade roots at the No.1 blade position (Ref.Fig.502). Position the spacer ring over the disk, then align the datum marks on both items and lower the spacer ring over the locating pins and on to the disk. Ensure that the spacer abuts the disk, then allow the disk to cool.
- L. Assemble the Stage 7 Bladed Disk/Spacer Ring to the Balancing Machine and Check Balance the Disk.
- (1) Assemble the disk/spacer to the balancing mandrel, then assemble the mandrel/disk/spacer to the balancing machine as detailed in para.B.(5) to (11).

SUB-ASSEMBLY

72-33-02

Page 579

- (2) Apply lubricant 'A' to the spindles of the adjustable bearings and the journals of the mandrel, and ensure that they remain well lubricated throughout the balancing operation.
  - (3) Remove the balance No.2 lump of plasticine, then carry out a static balance of the bladed disk/spacer, operating the balancing machine in accordance with the manufacturers instructions. The disk should be rotated at (approx.) 450 rpm and run for (approx.) two to three min for the temperature to stabilise. The balance of the disk must be within 8 drmm in. (360 grm mm). If the balance of the disk is outside the limits, no form of rectification is possible at this stage. The spacer ring and blades must be removed from the disk and the complete procedure repeated, ensuring that it is strictly adhered to, and that the balancing No.1 and 2 lumps of plasticine are not mistaken.
- M. Remove the Stage 7 Bladed Disk from the Balancing Machine and Remove the Spacer Ring from the Disk.
- (1) Remove the stage 7 bladed disk/spacer ring from the balancing machine and assemble to the Hydraclamp as detailed in para.D.(1) to (6).
  - (2) Remove the stage 6-7 spacer ring from the stage 7 disk as detailed in para.E.(1) to (4).
- N. Number and Remove the Blades from the Stage 7 Disk.
- (1) Examine the edge of the disk for the No.1 blade datum mark → O , then examine the blade roots for their numbering (Ref.Fig.502) and ensure that all the blades are numbered correctly in numerical sequence in a clockwise direction as viewed from the mandrel side, with No.1 blade in the datum slot. Etch all new blades with their position No., and renumber any blades that have been re-positioned, ensuring that all old position No. are obliterated.

- (2) With the platform (Tool 1390) assembled to the container (Tool 1373), withdraw the blades from the disk and insert them in the container platform.

P. Remove the Stage 7 Disk from the Balancing Mandrel.

- (1) Assemble the multiple leg sling (Tool 1173) to the disk.
  - (a) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.
  - (b) Ensure that the knurled nuts are unscrewed and the claws turned to align them with the plate. Lower the hoist and engage the plate in the disk, then turn the claws outwards to engage them under the disk. Tighten the knurled nuts to lock the claws in position.
- (2) Remove the hand nut and clamp plate from the container (Tool 1419). Raise the hoist and withdraw the disk from the mandrel studs, lightly tapping the disk with a (soft faced) mallet (if required). Position the disk over its container (Tool 1419), then lower the hoist and locate the disk on the containers locating plate. Release the knurled nuts of the sling, turn the claws sideways and lower the disk on to the locating plate. Remove the sling from the hoist and the disk. Assemble the clamp plate to the centre screw and secure it with the hand nut.

NOTE: The stage 7 disk, spacer ring and blades are now ready to be passed to the HP Compressor Assembly (72-33-00 Assembly).

- (3) Remove the balancing mandrel from the Hydraclamp.
  - (a) Attach a hoist to the ring of the retaining bolt, release the Hydraclamp, then lower the mandrel on to the support stand. Release the hoist, then remove the retaining bolt.

SUB-ASSEMBLY

- (b) Attach a hoist to the lifting eye of the lifting fixture (Tool 1171), then position the hoist over the balancing mandrel and engage the two hooks of the fixture around the mandrel.
- (c) Remove the nuts and washers securing the mandrel to the mounting plate, then remove the support stand and traverse the hoist to disengage the mandrel from the mounting plate. Position and lower the mandrel into its storage stand, then remove the lifting fixture from the mandrel and the hoist. Assemble the washers and nuts to the mandrel studs and the special nuts to the mandrel locating/securing studs.

## 12. Balance the Stage 1 Rotor

NOTE: If all the original blades are available and undamaged and are to be assembled to the original disk, the bladed disk does not require balancing, but the blades must be assembled to the disk with serviceable retaining plates (1-220) as detailed in para.B and F.

A. Apply Dry Film Lubricant (Engines to SB 72-8879-338 standard only) (Ref.Fig.520A).

- (1) Apply one coat of dry film lubricant to the loaded flanks of the stage 1 rotor blades as instructed in Chapter 72-09-18 Repair.
- (2) Apply two coats of dry film lubricant to the stage 1 disk root serrations, with a minimum drying time of 10 minutes between coats, as instructed in Chapter 72-09-18 Repair.

B. Assemble Blades to Stage 1 Disk and Prepare for Balancing.

NOTE: If the disk is to SB.72-34 standard, only blade positions No.1 and 34 will be marked on the edge of the disk.

- (1) Screw a suitable lifting eye-bolt (Ref.Fig.522) in to the balancing adapter (Tool 1825).
- (2) Attach a hoist to the lifting eye, then raise the hoist and position and lower the adapter onto a work surface.
- (3) Disengage and remove the hoist, then unscrew and remove the nuts and washers from the adapter location pins (Tool 1841).
- (4) Assemble the lifting fixture (Tool 369) to the stage 1 disk (1-230) (Ref.Fig.521).

NOTE: The lifting fixture should be offered to the front face of the disk, denoted by the smaller outside diameter.

- (a) Attach a hoist to the lifting ring of the fixture, then position the hoist over the disk.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (b) Raise the disk from its container (Tool 1418) and position three equi-spaced support blocks beneath it.
- (c) Ensure that the fixture hand knobs are engaged at the 'FREE' position. Lower the hoist and engage the plate in the disk. Withdraw each hand knob from its locking hole, turn the knobs to the 'LOCK' position engaging the claws under the disk, then depress the knobs to engage them in their lock holes.
- (d) Raise the hoist and position the disk over the balancing adapter. Align the holes in the disk with the location pins, then lower the disk on to the adapter.
- (e) Withdraw each lifting fixture hand knob from its locking hole, turn the knobs to the 'FREE' position, then depress the knobs to engage the locking holes. Raise the fixture from the disk, then remove the fixture from the hoist.
- (5) Reassemble the nuts and washers to the location pins to secure the disk to the adapter.
- (6) Assemble the blades to the stage 1 disk.

NOTE: Blades are assembled from the rear face of the disk.

NOTE: If all the original blades are available and undamaged, then assemble the blades as detailed in para.(a). If the blades include four repaired and/or new blades, then the blades must be assembled as detailed in para.(b). If the blades include more than four repaired and/or new blades, then the blades must be assembled as detailed in para.(c). Ensure that the aggregate depth of blending of repaired blades does not exceed 0.90 in. (22,86 mm) (Ref.72-33-02 Repair No.6).

heavy and light blades and where possible, positioning equal weight blades diametrically opposite each other. Bend each retaining plate inward, across the face of the disk, sufficient to lock each blade in position.

(d) Assemble a blade protector (Tool 1130) to the blade tips.

C. Assemble the Stage 1 Bladed Disk and Adapter to the (Schenck ZE.40) Balancing Machine.

- (1) Attach a hoist to the lifting eye of the adapter (Ref.Fig.522).
- (2) Raise the hoist and position the adapter/disk above the spindle head of the balancing machine. Align the holes in the adapter hub with those of the spindle head, then lower the adapter on to the machine.
- (3) Secure the adapter to the machine with the six retaining screws (Tool 1826).
- (4) Disengage and remove the hoist, then unscrew and remove the lifting eye from the adapter and the protector from the blade tips.

D. Balance the Stage 1 Bladed Disk.

- (1) Carry out a static balance of the bladed disk, operating the balancing machine in accordance with the manufacturers instructions. The disk should be rotated as for engine rotation, (counter-clockwise viewed from the rear). Balance must be within 4 drn in. (180 grm mm) and is achieved by the interchange of heavy and light blades. Before any blades are interchanged, check the out of balance readings by rotating the disk 180 degrees relative to the adapter and repeating the balancing procedure.

E. Remove the Bladed Disk/Adapter form the Balancing Machine.

- (1) Screw a lifting eye into the adapter hub and assemble the protector (Tool 1130) to the blade tips.
- (2) Attach a hoist to the adapter lifting eye, then unscrew and remove the six retaining screws which secure the adapter to the balancing machine.
- (3) Raise the hoist and remove the adapter/disk from the machine. Position the assembly on a work surface, then disengage and remove the hoist.
- (4) Examine the edge of the disk for the No.1 blade datum mark  $\rightarrow 0$ , then examine the blade roots for their numbering (Ref.Fig.502). Ensure that all the blades are numbered correctly in numerical sequence in a clockwise direction (viewed from the rear), with No.1 blade in the datum slot. Etch all new blades with their position No. and renumber any blades that have been re-positioned. Ensure that old position No. are obliterated.

F. Secure the Blades to the Stage 1 Disk.

- (1) Remove the protector from the blade tips. Bend the slave retaining plate of the No.1 blade upward, away from the disk face, and slide the blade down out of its slot. Remove the slave retaining plate from the blade and assemble a serviceable plate (1-220), then assemble the blade/plate to the disk (Ref.Fig.523). Ensure that the blade is fully in, then using the hammer (Tool 1655), bend the protruding end of the retaining plate against the disk. Ensure that the bend of the plate is not too acute causing a fracture of the plate. Assemble a retaining plate to each of the blades, and lock each plate against the disk. Using feeler gauges, check each blade to ensure that the maximum end-float of the blade root in the disk does not exceed 0.015 in. (0,38 mm). Assemble the protection/retaining band (Tool 1130) to the tips of the blades.

- (2) Attach a hoist to the lifting eye, raise the hoist and position the adapter on a work surface.
- (3) Disengage and remove the hoist, then unscrew and remove the nuts and washers from the adapter location pins.
- (4) Assemble the multiple leg sling (Tool 1173) to the stage 2 disk (1-300) (Ref.Fig.524).

NOTE: The lifting fixture should be offered to the front face of the disk, denoted by the smaller outside diameter.

- (a) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.
  - (b) Ensure that the knurled nuts are unscrewed and the claws turned to align them with the plate.
  - (c) Raise the disk from its container (Tool 1419) and position three equi-spaced supports blocks beneath it.
  - (d) Lower the hoist and engage the plate in the disk, then turn the claws outwards to engage them under the disk. Tighten the knurled nuts to lock the claws in position.
- (5) Raise the hoist and position the disk above the balancing adapter. Align the holes in the disk with the adapter location pins then lower the disk on to the adapter (Ref.Fig.525).
  - (6) Reassemble the nuts and washers to the location pins to secure the disk to the adapter.

OVERHAUL

- (7) Assemble the blades to the stage 2 disk.

NOTE: If the disk is to SB 72-34 standard, only blade positions No.1 and 54 will be marked on the edge of the disk.

NOTE: Blades are assembled from the rear face of the disk.

NOTE: If all the original blades are available and undamaged, then assemble the blades as detailed in para.(a). If the blades include six repaired and/or new blade, then the blades must be assembled as detailed in para.(b). If the blades include more than six repaired and/or new blades, then the blades must be assembled as detailed in para.(c). Ensure that the aggregate depth of blending of repaired blades does not exceed 1.50 in. (38,10 mm) (Ref.72-33-02 Repair No.6).

- (a) Identify the stage 2 blades (1-280), then examine the blade roots for their positional No. (Ref.Fig.502) and lay the blades out in numerical sequence. Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades. Assemble a slave retaining plate 1-220) to the groove in each blade root (Ref.Fig.525), then insert the blades in numerical sequence into the disk, starting at No.1 position and working in a counter-clockwise direction when viewed from above.
- (b) Identify the stage 2 blades (1-280), then examine the roots of the original blades for their positional No. (Ref.Fig.502) and lay the blades out in numerical sequence, leaving spaces where new blades are to be positioned. Noting the mass moment weight of the new blades, place the lightest new blades in vacant positions next to the heaviest original blades, and position the heaviest new blades in vacant positions next to the lightest original blades. Assemble the slave retaining plates and blades to the disk as detailed in para.(a).

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (c) Identify the stage 2 blades (1-280), then according to the mass moment weight of the blades (quoted on the labels), lay the blades out in sequence of weight, starting with the heaviest blade and ending with the lightest. Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades (Ref.Fig.502). Assemble a slave retaining plate (1-290) to the groove in each blade root (Ref. Fig.525), then assemble the blades to the disk positioning the heaviest blade at No.1 position and the next heaviest blade diametrically opposite, then assemble the two lightest blades diametrically opposite each other and next to the heaviest blades. Assemble the remainder of the blades to the disk in sequence of weight, assembling alternate heavy and light blades and where possible, positioning equal weight blades diametrically opposite each other.
  - (d) If the disk is at SB 72-8925-358 standard, check that there is at least 0.010 in. (0,25 mm) side-ways movement at the tip of each blade, to ensure adequate clearance in disk slots coated with Sermetel 709.
  - (e) Bend each retaining plate inward across the face of the disk, sufficient to lock each blade in position.
  - (f) Assemble a blade protector (Tool 1130) to the blade tips.
- B. Assemble the Stage 2 Bladed Disk and Adapter to the (Schenck ZE.40) Balancing Machine.
- (1) Attach a hoist to the lifting eye of the adapter.
  - (2) Raise the hoist and position the adapter/disk above the spindle head of the balancing machine. Align the holes in the adapter hub with those of the spindle head, then lower the adapter on to the machine (Ref.Fig.525).
  - (3) Secure the adapter to the machine with the six retaining screws (Tool 1826).
  - (4) Disengage and remove the hoist, then unscrew and remove the lifting eye from the adapter and the protector from the blade tips.

C. Balance the Stage 2 Bladed Disk.

- (1) Carry out a static balance of the bladed disk, operating the balancing machine in accordance with the manufacturers instructions. The disk should be rotated as for engine rotation (counter-clockwise viewed from the rear). Balance must be within 4 drn in. (180 grm mm) and is achieved by the interchange of heavy and light blades. Before any blades are interchanged, check the out of balance readings by rotating the disk 180 degrees, relative to the adapter, and repeating the balancing procedure.
- (2) If the disk is to SB 72-8925-358 standard, check that there is at least 0.010 in. (0,25 mm) sideways movement at the tip of each blade.

D. Remove the Bladed Disk/Adapter from the Balancing Machine.

- (1) Screw the lifting eye into the adapter hub and assemble the protector (Tool 1130) to the blade tips.
- (2) Attach a hoist to the adapter lifting eye, then unscrew and remove the six retaining screws which secure the adapter to the balancing machine.
- (3) Raise the hoist and remove the adapter/disk from the machine. Position the assembly on a work surface, then disengage and remove the hoist.
- (4) Examine the edge of the disk for the No.1 blade datum mark 0, then examine the blade roots for their numbering (Ref.Fig.502). Ensure that all the blades are numbered correctly in numerical sequence in a clockwise direction (viewed from the rear), with No.1 blade in the datum slot. Etch all new blades with their position No. and renumber any blades that have been re-positioned. Ensure that old position No. are obliterated.

E. Secure the Blades to the Stage 2 Disk.

- (1) Remove the protector from the blade tips. Bend the retaining plate of the No.1 blade upward, away from the disk face, and slide the blade down out of its slot. Remove the slave retaining plate, and assemble a serviceable plate (1-290), then assemble the blade/plate to the disk (Ref.Fig.526). Ensure that the blade is fully in, then using the hammer (Tool 1655), bend the protruding end of the retaining plate against the disk. Ensure that the bend of the plate is not too acute causing a fracture of the plate. Assemble a retaining plate to each of the blades, and lock each plate against the disk. Using feeler gauges, check each blade to ensure that the maximum end-float of the blade root in the disk does not exceed 0.015 in. (0,38 mm). Assemble the protection/retaining band (Tool 1130) to the tips of the blades.
- (2) Assemble the multiple leg sling (Tool 1173) to the disk (Ref.Fig.524).
  - (a) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.
  - (b) Ensure that the knurled nuts are unscrewed and the claws turned to align them with the plate. Lower the hoist and engage the plate in the disk, then turn the claws outwards to engage them under the disk. Tighten the knurled nuts to lock the claws in position.
- (3) Raise the hoist and position and lower the disk on to a suitable pallet or container. Release the knurled nuts of the sling, turn the claws sideways, then raise the sling from the disk. Remove the sling from the hoist.

NOTE: The stage 2 bladed disk is now ready to be passed to the HP Compressor Assembly (72-33-00 Assembly).

#### 14. Balance the Stage 3 Rotor and Stage 2-3 Spacer Ring

NOTE: If all the original blades are available and undamaged and are to be assembled to the original disk/spacer, the bladed disk/spacer does not require balancing, but the spacer and blades must be assembled to the disk as detailed in para.A, B and G.

##### A. Assemble the Stage 2-3 Spacer Ring to the Stage 3 Disk.

- (1) Assemble a locating pin (Tool 607) to each of the three supports (Tool 608) and space the supports on a suitable clean flat surface.
- (2) Assemble the multiple leg sling (Tool 1173) to the stage 3 disk (1-350) (Ref.Fig.527).

NOTE: The sling should be assembled to the front face of the disk, denoted by the smaller outside diameter.

- (a) Raise the disk and position three equi-spaced support blocks beneath it.
  - (b) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.
  - (c) Ensure that the knurled nuts are unscrewed, and the claws are turned to align them with the plate. Lower the hoist and engage the plate in the disk, then turn the claws outward to engage them under the disk. Tighten the knurled nuts to lock the claws.
- (3) Raise the hoist and position the disk over the three supports (Tool 608). Evenly dispose the supports under the disk and align the pins with the bolt holes. Lower the disk over the pins and rest it on the supports.

OVERHAUL

- (4) Release the knurled nuts of the sling, turn the claws sideways, then raise the sling from the disk. Remove the sling from the hoist.
- (5) With the heater (Tool 757) handles uppermost (Ref. Fig.528) and positioned on its mobile stand (Tool 759), attach the multiple leg sling (Tool 1645) to the holes in the three handles with the sling shackles. Attach a hoist to the lifting eye of the sling, then position and lower the heater over the stage 3 disk ensuring that it is concentric with the disk.
- (6) Heat the disk to 70 deg.C by operating the heater control (Tool 758) (Ref.Fig.528).

NOTE: If the heater, control or stand are not available, use suitable units based on the wiring diagram (Ref.Fig.528).

- (a) Connect the heater control input supply plug to a suitable mains supply connection and turn the mains switch 'ON'.
- (b) Turn the three 'HEATER CONTROLS' band switches to 'FULL'.
- (c) Turn the heater time controller to nine minutes.
- (d) Switch the 'HEATERS' toggle switch to 'ON', then press the 'TIMER START' pushbutton to start the heating cycle. During the period the heater is on, the 'ON' indicator light will be remain illuminated and at the completion of nine minutes the heaters and light will automatically be switched off.
- (e) When the timer switch cuts out, switch the 'HEATERS' toggle switch to 'OFF', the 'HEATER CONTROLS' switches to 'OFF' and the mains supply switch to 'OFF'.

- (f) Remove the heater from the disk and position and lower it on to its stand. Release the hoist and lower the sling on to the heater, do not touch the heater unless protective gloves are worn.

NOTE: The multiple leg sling (Tool 1645) is also used for lifting mechanical pullers in addition to the heater. If only one sling is available, the operator must assemble and remove the sling from the heater each time it is used.

- (7) Note the position of the datum hole in line with the datum mark → 0 on the edge of the blade roots at the No.1 blade position of the stage 3 disk, and the datum mark 0 on the edge of the flange of the stage 2-3 spacer ring (1-330) (Ref.Fig.502). Position the spacer ring over the disk, align the datum marks on both items and lower the spacer over the locating pins and on to the disk. Ensure that the spacer abuts the disk, then allow the disk to cool.
- (8) Secure the disk to the spacer using six equi-spaced slave bolts and nuts (Tool 1828) (Ref.Fig.530).

B. Assemble Blades to Stage 3 Disk and Prepare for Balance.

- (1) Remove the disk/spacer from the supports, then reposition the supports to suit the holes in the front face of the spacer.
- (2) Invert the disk/spacer and reposition the assembly on the supports.

- G. Position the Stage 3 Disk/Spacer on a Suitable Pallet (Ref.Fig.513).

NOTE: The disk/spacer should now be repositioned with the spacer uppermost.

- (1) Unscrew and remove the slave nuts and bolts which secure the spacer to the disk.
- (2) Assemble the multiple leg sling (Tool 1173) to the disk.
  - (a) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk/spacer.
  - (b) Ensure that the knurled nuts are unscrewed, and the claws are turned to align them with the plate. Lower the hoist and engage the plate in the disk, then turn the claws outwards to engage them under the disk. Tighten the knurled nuts to lock the claws.
- (3) Raise the hoist and position and lower the disk/spacer on to a suitable pallet or container. Release the knurled nuts of the sling, turn the claws sideways, then raise the sling from the disk and remove the sling from the hoist.

NOTE: The stage 2-3 spacer ring is not normally removed from the stage 3 disk. If for some reason it is desired to separate the two, remove the spacer using mechanical puller (Tool 457), thrust bolts (Tool 458) and slave bolts (Tool 460). Stow the spacer in its container (Tool 1441). Refer to para.A. for the assembly of the spacer ring to the disk.

NOTE: The stage 3 bladed disk/spacer assembly is now ready to be passed to the HP Compressor Assembly (72-33-00 Assembly).

- H. Remove the Balancing Adapter from the Balancing Machine.

NOTE: The adapter is used to balance stages 3 to 7 of the HP Compressor and may be left assembled to the machine.

- (1) Screw the three lifting eye-bolts into the appropriate holes in the adapter (Ref.Fig.529).

- (2) Attach the sling (Tool 1645) to a hoist and position the sling above the adapter. Secure each leg of the sling to the eye-bolts with shackles.
- (3) Unscrew and remove the six retaining screws which secure the adapter to the adapter hub, then raise the hoist and remove the adapter.
- (4) Lower the adapter on to a suitable pallet and disconnect the hoist from the sling.
- (5) Unscrew and remove the six screws securing the adapter hub to the spindle head of the balancing machine, then remove the hub.

15. Balance the Stage 4 Rotor and Stage 3-4 Spacer Ring

NOTE: If all the original blades are available and undamaged, and are to be assembled to the original disk/spacer, the bladed disk/spacer does not require balancing, but the blades must be assembled to the disk as detailed in para.B., and relevant parts of para.A and F for lifting the disk and protecting/retaining the blades.

A. Assemble the Stage 3-4 Spacer Ring to the Stage 4 Disk.

- (1) Assemble the spacer ring (1-380) to the disk (2-20) as detailed in para.14.A. (1) to (7) with the difference that the locating pin (Tool 606) must be used instead of (Tool 607) (Ref.para.(1)).
- (2) Secure the disk to the spacer using six slave bolts and nuts (Tool 1832).

B. Assemble Blades to Stage 4 Disk and Prepare for Balance.

- (1) Assemble the blades (2-10) to the disk as detailed in para.14.B, with the difference that 'NOTE' (Ref.para.(3)) reads as follows:

NOTE: If all the original blades are available and undamaged, then assemble the blades as detailed in para.(a). If the blades include eight repaired and/or new blades, then the blades must be assembled as detailed in para.(b). If the blades include more than eight repaired and/or new blades, then the blades must be assembled as detailed in para.(c). Ensure that the aggregate depth of blending of repaired blades does not exceed 1.68 in. (42,67 mm) (Ref.72-33-02 Repair No.6).

C. Prepare the Balancing Machine (Schenck ZE.40) to Balance the Stage 4 Bladed Disk/Spacer Ring.

- (1) Assemble the hub and adapter as detailed in para.14.C (1) to (4).
- (2) Screw the six location pins (Tool 1833) into the appropriate holes in the adapter (Ref.Fig.529).

D. Assemble the Stage 4 Bladed Disk/Spacer Ring to the Balancing Machine.

- (1) Assemble the disk/spacer to the machine as detailed in para.14.D (1) to (4) and (6) to (7).

E. Balance the Stage 4 Bladed Disk/Spacer Ring.

- (1) Balance the bladed disk/spacer ring as detailed in para.14.E.

F. Remove the Bladed Disk/Spacer Ring from the Balancing Machine and Number the Blades.

- (1) Remove the disk/spacer from the machine and number the blades as detailed in para.14.F.

G. Remove the Stage 3-4 Spacer Ring from the Stage 4 Disk (Ref.Fig.531).

- (1) Attach a hoist to the multiple leg sling (Tool 1645), then position the hoist over the mechanical puller (Tool 471) and secure the sling to the puller eye bolts with shackles. Ensure that the puller thrust bolts are unscrewed.
- (2) Unscrew and remove the slave bolts and nuts securing the spacer ring to the disk. Raise and position the puller above the spacer/disk. Lower the hoist and guide the puller thrust pins through the bolt holes in the spacer, until the pins abut the disk. Insert the nine securing pins (Tool 474) into the holes in the puller plate, then insert the nine slave bolts (Tool 475) into the front flange of the spacer and screw the securing pins on to them. Ensure that the flats on the slave bolts locate correctly, then tighten the pins.
- (3) Screw in on the thrust bolts until the play on the top plate is taken up, then separate the spacer from the disk by screwing in the thrust bolts in equal progressive increments until the items are separated.
- (4) Raise the hoist and position and lower the spacer ring on to a suitable clean flat surface. Unscrew the securing pins and remove the slave bolts. Raise the hoist and position and lower the puller on to a suitable surface, then release and remove the sling from the puller and hoist. Stow the spacer ring into its correct slot in the container (Tool 1441).

NOTE: The stage 4 bladed disk and stage 3-4 spacer ring are now ready to be passed to the HP Compressor Assembly (72-33-00 Assembly).

OVERHAUL

H. Remove the Balancing Adapter from the Balancing Machine.

NOTE: The adapter is used to balance stages 3 to 7 of the HP compressor and may be left assembled to the machine.

- (1) Remove the balancing adapter from the machine as detailed in para.14.H.

16. Balance the Stage 5 Rotor and Stage 4-5 Spacer Ring

NOTE: If all the original blades are available and undamaged and are to be assembled to the original disk/spacer, the bladed disk/spacer does not require balancing, but the blades must be assembled to the disk as detailed in para.B., and the relevant parts of para.A and F for lifting the disk and protecting/retaining the blades.

A. Assemble the Stage 4-5 Spacer Ring to the Stage 5 Disk.

- (1) Assemble the spacer ring (2-50) to the disk (2-70) as detailed in para.14.A. with the difference that the locating pin (Tool 606) must be used instead of (Tool 607) (Ref.para.(1)).
- (2) Secure the disk to the spacer using slave bolts and nuts (Tool 1832).

B. Assemble Blades to Stage 5 Disk and Prepare for Balance.

- (1) Assemble the blades (2-60) to the disk as detailed in para.14.B., with the difference that 'NOTE' (Ref.para.(3)) reads as follows:

NOTE: If all the original blades are available and undamaged, then assemble the blades as detailed in para.(a). If the blades include nine repaired and/or new blades, then the blades must be assembled as detailed in para.(b). If the blades include more than nine repaired and/or new blades, then the blades must be assembled as detailed in para.(c). Ensure that the aggregate depth of blending of repaired blades does not exceed 1.92 in. (48,76 mm) (Ref. 72-33-02 Repair No.6).

OVERHAUL

18. Balance the Stage 7 Rotor and Stage 6-7 Spacer Ring

NOTE: If all the original blades are available and undamaged and are to be assembled to the original disk/spacer, the balancing of the bladed disk/spacer is not required and para.18 need not be carried out.

A. Assemble the Stage 6-7 Spacer Ring to the Stage 7 Disk.

- (1) Assemble a locating pin (Tool 604) to each of the three supports (Tool 608) and place the supports on a suitable clean flat surface.
- (2) Assemble the multiple leg sling (Tool 1173) to the stage 7 disk (3-370) (Ref.Fig.527).

NOTE: The sling is attached to the front face of the disk, denoted by the smaller outside diameter.

- (a) Raise the disk and position three equi-spaced support blocks beneath it.
  - (b) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.
  - (c) Ensure that the knurled nuts are unscrewed, and the claws turned to align with the plate. Lower the hoist and engage the plate in the disk, then turn the claws outward to engage them under the disk. Tighten the knurled nuts to lock the claws in position.
- (3) Raise the hoist and position the disk over the three supports (Tool 608). Evenly dispose the supports under the disk and align the pins with the inner ring of holes. Lower the disk over the pins and rest it on the supports.
  - (4) Release the knurled nuts of the sling, turn the claws sideways, then raise the sling from the disk. Remove the sling from the hoist.

- (5) With the heater (Tool 757) handles uppermost (Ref. Fig.528) and positioned on its mobile stand (Tool 759), attach the multiple leg sling (Tool 1645) to the holes in the three handles with the sling shackles. Attach a hoist to the lifting eye of the sling, then position and lower the heater over stage 7 disk ensuring that it is concentric with the disk.
- (6) Heat the disk to 70 deg.C by operating the heater control (Tool 758) in accordance with para.14.A.(6). On completion of its heating cycle, remove the heater from the disk and position and lower it on to its stand. Release the hoist and lower the sling on to the heater, do not touch the heater unless protective gloves are worn.
- (7) Note the position of the datum hole in line with the datum mark  $\rightarrow 00 \leftarrow$  on the edge of the outer (inward facing) flange of the stage 6-7 spacer ring (3-390), and the datum hole in line with the datum mark  $\rightarrow 0$  on the blade roots at the No.1 blade position (Ref.Fig.502). Position the spacer ring over the disk, align the datum marks on both items and lower the spacer ring over the locating pins and on to the disk. Ensure that the spacer abuts the disk, then allow the disk to cool.
- B. Prepare the Balancing Machine (Schenck ZE.40) to Balance the Stage 7 Disk and Spacer Ring.
- (1) Assemble the hub and balancing adapter to the balancing machine as detailed in para.14.C.(1) to (4).
- (2) Assemble to the adapter the six location pins (Tool 1838) (Ref.Fig.529).
- C. Assemble the Stage 7 Disk/Spacer Ring to the Balancing Machine (Ref.Fig.518).
- (1) Assemble the multiple leg sling (Tool 1173) to the stage 7 disk/spacer (Ref.Fig.532).

OVERHAUL

- (a) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.
- (b) Ensure that the knurled nuts are unscrewed, and the claws turned to align with the plate. Lower the hoist and engage the plate in the disk, then turn the claws outward to engage them under the disk. Tighten the knurled nuts to lock the claws in position.
- (c) Raise the hoist and ensure that the support locating pins are disengaged from the disk, then position the hoist over the balancing machine.
- (d) Correctly position the disk relative to the adapter location pins, then lower the disk on to the pins, ensuring that it is lowered squarely and does not get jammed. When the disk abuts the pins, screw the nuts and washers on to the pins and fully tighten the nuts.
- (e) Release the knurled nuts of the sling, turn the claws sideways, then raise the sling from the disk. Remove the sling from the hoist.

D. Balance the Stage 7 Disk/Spacer Ring.

- (1) Carry out a static balance of the disk/spacer, operating the balancing machine in accordance with the manufacturers instructions. The balance of the disk/spacer must be within 2 drmm in. (90 grmm mm). If the balance is outside the limit, rectify by adding plasticine to the disk face at the outer ring bolt hole location, in line with the out of balance angular position. The plasticine will be identified as balance No.1.

E. Remove the Stage 7 Disk/Spacer Ring from the Balancing Machine.

- (1) Assemble the multiple leg sling (Tool 1173) to the stage 7 disk/spacer (Ref.Fig.532).
  - (a) Attach a hoist to the lifting ring of the sling, then position the hoist over the disk.

- (b) Ensure the knurled nuts are unscrewed and the claws turned to align with the plate. Lower the hoist and engage the plate in the disk, then turn the claws outward to engage them under the disk. Tighten the knurled nuts to lock the claws in position.
- (c) Unscrew and remove the six nuts and washers which secure the disk/spacer to the adapter location pins.
- (d) Raise the hoist and remove the disk/spacer from the balancing machine, then position the disk/spacer onto the three supports (Tool 608).
- (e) Unscrew the knurled nuts and turn the claws to align with the plate. Tighten the knurled nuts then raise the hoist and remove the sling.

F. Remove the Stage 6-7 Spacer Ring from the Stage 7 Disk (Ref.Fig.533).

- (1) Attach a hoist to the multiple leg sling (Tool 1645), then position the hoist over the mechanical puller (Tool 976) and secure the sling to the puller eye-bolts with shackles.
- (2) Position and lower the mechanical puller over the spacer ring and align the puller extractor pins with the bolt holes in the spacer. Ensure that the pawls of the extractor pins spring out from the pins, and that the knurled nuts are unscrewed. Lower the puller on to the spacer ensuring that the pins enter the spacer bolt holes. Push the pins into the spacer until the pawls spring out and engage behind the spacer, then pull up on the pins and tighten the knurled locknuts, ensuring that the pawls of all the pins are located and locked underneath the spacer ring.
- (3) Screw in on the six jacking screws until they contact the disk, then separate the spacer from the disk by screwing in the jacking screws in equal progressive increments until the items are separated.

SUB-ASSEMBLY

72-33-02

- (4) Raise the hoist and position and lower the spacer ring on to a suitable clean flat surface. Release the mechanical puller extractor pin knurled locknuts, press the pawls into the pins, then withdraw the pins from the spacer ring. Raise the mechanical puller and lower on to a suitable surface, then release and remove the multiple leg sling from the puller, and the sling from the hoist.

G. Assemble the Stage 7 Disk to the Balancing Machine.

- (1) Assemble the multiple leg sling (Tool 1173) to the disk and the disk to the balancing machine as detailed in para.C.

H. Balance the Stage 7 Disk.

- (1) Carry out a static balance of the disk, operating the balancing machine in accordance with the manufacturers instructions. The balance of the disk must be within 2 drmm in. (90 grm mm). If the balance is outside the limit, rectify by adding plasticine to the disk face at the outer ring bolt hole location, in line with the out of balance angular position. Do not touch the balance No.1 plasticine, and identify the second lump of plasticine as balance No.2.

J. Remove the Stage 7 Disk from the Balancing Machine and Assemble the Blades.

- (1) Remove the stage 7 disk from the balancing machine as detailed in para.E.(1) (a) to (e).

JN1958

SUB-ASSEMBLY

OVERHAUL

(2) Assemble blades to the stage 7 disk.

NOTE: If all the original blades are available and undamaged, then assemble the blades as detailed in para.(a). If the blades include 12 repaired and/or new blades, then the blades must be assembled as detailed in para.(b). If the blades include more than 12 repaired and/or new blades, then the blades must be assembled as detailed in para.(c). Ensure that the aggregate depth of blending of repaired blades does not exceed 2.40 in. (60,96 mm) (Ref.72-33-02 Repair No.6).

- (a) Identify the stage 7 blades (3-360), then examine the blade roots for their positional No. (Ref.Fig.502) and lay the blades out in numerical sequence. Examine the edge of the disk at the blade root position and identify the position of No.1, 2 and 3 blades, then insert the blades in numerical sequence into the front face of the disk, starting at No.1 position and working in a counter-clockwise direction when viewed from above.
- (b) Identify the stage 7 blades (3-360), then examine the roots of the original blades for their positional No. (Ref.Fig.502) and lay the blades out in numerical sequence, leaving spaces where new blades are to be positioned. Noting the mass moment weight of the new blades, place the lightest new blades in vacant positions next to the heaviest original blades, and position the heaviest new blades in vacant positions next to the lightest original blades. Assemble the blades to the disk as detailed in para.(a).

PRINTED IN ENGLAND

TN3690

OLYMPUS 598  
MK.610-14-28  
OVERHAUL

- (c) Identify the stage 7 blades (3-360), then according to the mass moment weight of the blades (quoted on the labels), lay the blades out in sequence of weight, starting with the heaviest blade and ending with the lightest. Examine the edge of the disk at the blade root position and identify the position of No.1; 2 and 3 blades (Ref.Fig.502). Assemble the blades into the front face of the disk positioning the heaviest blade at No.1 position and the next heaviest blade diametrically opposite, then assemble the two lightest blades diametrically opposite each other and next to the heaviest blades. Assemble the remainder of the blades to the disk in sequence of weight, assembling alternate heavy and light blades and where possible, positioning equal weight blades diametrically opposite each other.
- K. Assemble the Stage 7 Bladed Disk to the Balancing Machine and Balance the Disk.
- (1) Assemble the stage 7 bladed disk to the balancing machine as detailed in para.C.(1) (a) to (e).
  - (2) Assemble two lifting eye-bolts to the retaining plate (Tool 1839). Attach a sling to a hoist and position the sling above the plate. Assemble and secure the sling to the eye-bolts with shackles.
  - (3) Raise the hoist and position the retaining plate above the balancing machine. Align the retaining plate key, bridging the aperture in the top of the plate, with the slot in the pillar of the adapter.
  - (4) Lower the plate on to the adapter and secure with the knurled nut.

SUB-ASSEMBLY

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (5) Remove the plasticine balance No.1, then carry out a static balance of the bladed disk, operating the balancing machine in accordance with the manufacturers instructions. The disk should be rotated as for engine rotation (counter-clockwise from the rear). The balance of the disk must be within 2 drn in. (90 grm mm). If the balance of the disk is outside the limit, rectify by the interchange of heavy and light weight blades from the out of balance angular position, until the disk is within limits. Before any blades are interchanged check the out of balance readings by rotating the disk 180 degrees, relative to the adapter and retaining plate, and repeating the balancing procedure.

L. Remove the Stage 7 Bladed Disk from the Balancing Machine and Assemble the Stage 6-7 Spacer Ring to the Disk.

- (1) Attach the sling to a hoist and position the sling above the balancing machine.
- (2) Unscrew and remove the knurled nut from the pillar of the adapter, then screw the two lifting eye-bolts into the retaining plate.
- (3) Secure the sling to the plate with shackles then raise the hoist and remove the plate. Position the plate on a suitable surface or pallet then remove the sling from the plate and hoist.
- (4) Remove the stage 7 bladed disk from the balancing machine as detailed in para.E.(1) (a) to (c).

SUB-ASSEMBLY

72-33-02

Page 598.31

- (5) Raise the hoist and withdraw the disk from the pins. Position the disk over the three supports (Tool 608), evenly dispose the three supports under the disk to align the pins with the inner ring of holes. Lower the disk over the pins and rest it on the supports.
- (6) Release the knurled nuts of the sling, turn the claws sideways, then raise the sling from the disk. Remove the sling from the hoist. Ensure that the disk and blade roots are perfectly clean.
- (7) With the heater (Tool 757) positioned on its mobile stand (Tool 759), handles uppermost, assemble the multiple leg sling (Tool 1645) to the holes in the three handles with the sling shackles. Attach a hoist to the lifting eye of the sling, then position and lower the heater over stage 7 disk ensuring that it is concentric with the disk.
- (8) Heat the disk to 70 deg.C. operating the heater control (Tool 758) in accordance with para.6.A.(6). On completion of its heating cycle, remove the heater from the disk and position and lower it on to its stand. Release the hoist and lower the sling on to the heater, do not touch the heater unless protective gloves are worn. When the heater is cool, release and remove the sling from the heater.
- (9) Note the position of the datum hole in line with the datum mark  $\Rightarrow 00 \Leftarrow$  on the edge of the outer (inward facing) flange of the stage 6-7 spacer ring, and the datum hole in line with the datum mark  $\Rightarrow 0$  on the blade roots at the No.1 blade position (Ref.Fig.502). Position the spacer ring over the disk, align the datum marks on both items and lower the spacer ring over the locating pins and on to the disk. Ensure that the spacer abuts the disk, then allow the disk to cool.

M. Assemble the Stage 7 Bladed Disk/Spacer Ring to the Balancing Machine and Check Balance the Disk.

- (1) Assemble the disk/spacer to the balancing machine as detailed in para.C.(1) (a) to (e).

TN276

SUB-ASSEMBLY

PRINTED IN ENGLAND

- (2) Remove the balance No.2 lump of plasticine, then carry out a static balance of the bladed disk/spacer, operating the balancing machine in accordance with the manufacturers instructions. The balance of the disk must be within 8 drmm in. (360 grm mm). If the balance of the disk is outside the limits, no form of rectification is possible at this stage. The spacer ring and blades must be removed from the disk and the complete procedure repeated, ensure that it is strictly adhered to, and that the balancing No.1 and 2 lumps of plasticine are not mistaken.

N. Remove the Stage 7 Bladed Disk/Spacer Ring from the Balancing Machine and Remove the Spacer from the Disk.

- (1) Remove the stage 7 bladed disk/spacer ring from the balancing machine as detailed in para.E.(1) (a) to (e).
- (2) Remove the stage 6-7 spacer ring from the stage 7 disk as detailed in para.F.(1) to (4).

P. Number and Remove the Blades from the Stage 7 Disk.

- (1) Examine the edge of the disk for the No.1 blade datum mark  $\rightarrow 00 \leftarrow$ , then examine the blade roots for their numbering (Ref.Fig.502) and ensure that all the blades are numbered correctly in numerical sequence in a clockwise direction, viewed from the rear, with No.1 blade in the datum slot. Etch all new blades with their position No., and renumber any blades that have been re-positioned, ensure that all old position No. are obliterated.
- (2) With the platform (Tool 1390) assembled to the container (Tool 1373), withdraw the blades from the disk and insert them in the container platform.
- (3) Assemble the stage 7 disk to its container (Tool 1419).

NOTE: The stage 7 disk, spacer ring and blades are now ready to be passed to the HP Compressor Assembly (72-33-00 Assembly).

HP TURBINE ROTOR - SUB-ASSEMBLY

1. General

- A. Prior to commencing assembly, refer to 72-09-00 Assembly for general information.
- B. During the sub-assembly procedure reference will be made to the Illustrated Parts Catalogue (I.P.C.) to identify those items where the nomenclature does not positively identify them due to duplication of the title e.g. nuts, bolts, washers etc. Where the item is part of this text it will be identified as e.g. bolt (1-10), the 1 referring to the I.P.C. Fig.No. and the 10 referring to the Item No. Where items from a different breakdown (module) are introduced, then the breakdown number will be quoted in addition e.g. bolt (72-51-04/1-180).
- C. Throughout the text special tools are quoted by their Ref.No. e.g. (Tool 1234). For a complete list of tooling required for the assembly and for the Manufacturers Part No., refer to Special Tools, Fixtures and Equipment Table 1002.
- D. This chapter details the work necessary for preparing the HP Turbine Rotor for a further engine or module life. The assembly comprises the washing and mass moment weighing of the blades, the assembly of the blades to the disk and the static balance of the assembly (Ref.para.1 to 8).
- E. On engines to Pre SB.72-8305-154 Part 2 standard, the HP Turbine Rotor and Hub and Labyrinth Assemblies (72-51-04) are dynamically balanced in conjunction with the HP Compressor Assembly (72-33-00). On engines or modules overhauled or repaired with the tooling introduced by SB.72-8305-154 Part 2, the HP Compressor Assembly can be dynamically balanced using a HP Turbine simulator, providing that the HP Turbine Hub and Labyrinths are the original, or are statically balanced with either a balanced bladed HP Turbine Rotor, or a slave turbine rotor as detailed in this chapter (Ref.para.9 onwards).

CAUTION: TURBINE BLADES (72-51-03/1-30A) SB.72-43 PART 1 MUST NOT BE MIXED WITH TURBINE BLADES (72-51-03/1-30B) SB.72-43 PART 2 OR WITH BLADES TO PRE-SB.72-43 STANDARD.

2. Pressure Wash HP Turbine Blades (Ref.Fig.501)

A. Assemble HP Turbine Blades to Pressure Wash Fixture (Tool 390).

- (1) Open the fixture by operating the lever, then remove the lid. Place the turbine blade in the fixture. Place the fixture lid in position and close the fixture.

B. Install Support Bracket.

- (1) Position the support bracket (Tool 754) on the wash tank and secure with the handnut.
- (2) Assemble the pressure wash fixture to the support bracket and secure it with the nut, bolt and washer on the underside of the fixture.

C. Pressure Wash Procedure.

NOTE: The following procedure is a non-calibrated witness check requiring equipment capable of delivering a low pressure flow of filtered paraffin through an outlet hose capable of connecting to the pressure wash fixture (Tool 390).

- (1) Securely connect the oil hose union nut to the union on the pressure wash fixture. Place an anti-splash screen around the assembly.
- (2) Adjust the pressure wash equipment to obtain a flow pressure of 5 psig and thoroughly wash out each turbine blade. Ensure that oil flows freely through each cooling hole.
- (3) Investigate and rectify obstruction of any cooling hole.
- (4) Switch off the pressure wash equipment and remove the turbine blade from the pressure wash fixture. Remove residual paraffin oil from the turbine blade.

WARNING: ENSURE THAT SAFETY PRECAUTIONS ARE APPLIED IF COMPRESSED AIR IS USED TO REMOVE PARAFFIN.

- (5) Place the turbine blades into container (Tool 1425).

OVERHAUL

(6) Disconnect the oil hose from the pressure wash fixture and remove the fixture from the support bracket.

(7) Remove the support bracket from the wash tank.

3. Mass Moment Weigh Turbine Blades (Schenk Vertical Spindle Machine)

NOTE: Operate the machine in accordance with the manufacturers instructions. Set the machine to operate in a clockwise direction.

A. Prepare Equipment (Ref.Fig.502).

- (1) Assemble moment weighing adapter (Tool 15) to the drive shaft.
  - (a) Remove the adapter from container (Tool 267).
  - (b) Ensure thorough cleanliness of the adapter and the drive shaft.
  - (c) Rotate the drive shaft to achieve 0 setting on the illuminated indicator situated on the front of the drive shaft cabinet.
  - (d) Place the adapter in position on the drive shaft studs. Ensure that the turbine blade location end of the adapter is positioned on the marked plate on the table section. The setting in (c) must also be maintained during this procedure.
  - (e) Secure the adapter to the drive shaft with six nuts and washers.
- (2) Assemble adapter arm (Tool 11) to the weighing adapter.
  - (a) Remove the adapter arm from container (Tool 169) and ensure thorough cleanliness of the unit.
  - (b) Place the adapter arm in position on the adapter and secure with the nut and washer.
  - (c) Set the sliding weight on the adapter arm to 0 oz in.

NOTE: The sliding weight is moved by depressing the flat section before setting to the required scale setting.

SUB-ASSEMBLY

72-51-03

Page 505

Jan 1/78

OLYMPUS 593

MK. 610-14-28

OVERHAUL

- (3) Assemble the squared graticule (Tool 33) to the vectometer screen location.
  - (a) Hold the existing screen in position whilst lifting the hinged retaining clips and releasing the retaining screw at the top of the screen.
  - (b) Carefully withdraw the screen and place in a protective container.
  - (c) Place the squared graticule in position ensuring that the slot engages with the pin at bottom position.
  - (d) Secure the graticule with the hinged clips and retaining screw.

B. Calibrate Equipment (Ref.Fig.502).

- (1) Operate the weighing machine and adjust to obtain 0 horizontal/vertical setting.
- (2) If the vectometer light spot is horizontally outside of the graticule squares, adjust as follows.
  - (a) Unscrew and remove the tangential adjustment weight locking pin on the mass moment weighing adapter (Tool 15).
  - (b) Rotate the weight in order to adjust to the right or left in accordance with the graduated plate and marks on the side of the weight.
  - (c) On completion of the adjustment, screw the adjustment weight locking pin into position and tighten. Repeat the procedure detailed in (1).
- (3) Check sliding weight on the adapter arm.
  - (a) Set the sliding weight to 2 oz in. (56.699 g) on the adapter arm.
  - (b) Operate the machine to check the sliding weight setting.
  - (c) Set the sliding weight to each position on the adapter arm and check each setting by operating the machine.

OVERHAUL

- (d) In the event of unsatisfactory calibration results, check the assembly of the tools and security of the sliding weight before investigation of balancing machine malfunction.

C. Mass Moment Weigh Each Blade (Ref.Fig.502).

- (1) Insert the turbine blade into the blade root location in the end of the moment weighing adapter.
- (2) Secure the blade with the retaining plate and bolt on the adapter.
- (3) Place balance weight (Tool 27) on the weighing adapter and secure with the locknut. Set the sliding weight on the adapter arm to 20 oz in. (566.990 g).

NOTE: The 20 oz in. setting is an approximation for the first blade, final adjustment of the sliding weight will be made to suit each blade.

- (4) Check the security of the assembly then operate the machine to mass moment weigh.
- (5) Remove each blade from the adapter on completion of weighing.
- (6) Attach an adhesive label to each blade and inscribe with the weight and engine serial number.
- (7) Place the blades into the containers and convey to the appropriate sub-assembly area.

4. Mass Moment Weigh Blades (Avery Scales TYPE 62N/5)

NOTE: This is an alternative method to that detailed in para.3.

A. Prepare Equipment (Ref.Fig.503).

- (1) Assemble the adapter arm locator (Tool 1274) to the adapter arm (Tool 1272).
- (2) Adjust the setting on the adapter arm to 13.405 in. (340.487 mm).
- (3) Attach the adapter arm to the weighing scale arm and secure firmly.
- (4) Ensure that the scale pans suspension piece is correctly positioned.

OVERHAUL

- (5) Carefully add weights to the upper scale pan to achieve 0 reading on the scale. Fine adjustment can be effected by moving the screwed adjustment weights on the front of the scale.
- (6) Ensure that the screwed adjustment weights are locked together when 0 setting is achieved.
- (7) Check the scale reading progressively by adding weights 1 oz (28.35 g) increments to the upper scale pan.
- (8) On completion of the checks return to 0 reading on the scale as detailed in (5).

B. Mass Moment Weigh Each Blade (Ref.Fig.503).

CAUTION: EXERCISE CARE DURING ASSEMBLY OF BLADES TO ADAPTER ARM. AVOID EXCESSIVE VIBRATION AS DAMAGE TO SCALE OR DISPLACEMENT OF PANS COULD RESULT.

- (1) Carefully place the blade in position on the adapter arm locator and simultaneously engage the blade root with the setting piece on the adapter arm.
- (2) Adjust the setting piece in order to achieve a parallel setting between the blade and adapter arm. Ensure that the setting piece is secure after adjustment.
- (3) Carefully add weights to the lower scale pan until the scale indicator moves.
- (4) Add the total weight value in the lower scale pan to the scale indicator reading.
- (5) Remove the blade from the adapter arm and attach an adhesive label inscribed with the weight and engine serial number.
- (6) Place the blades into the containers and convey the set to the appropriate sub-assembly area on completion of weighing.

5. Assemble HP Turbine Blades to Disk

A. Prepare to Install Turbine Blades (Ref.Fig.504).

- (1) Secure the lifting fixture (Tool 1113) to the end of balancing mandrel (Tool 139) and tighten the securing bolt.

SUB-ASSEMBLY

OVERHAUL

- (2) Prepare the mobile stand (Tool 1111) to accept the mandrel.
- (a) Check that the clamp support tubes are securely held in the vertical position by the pins located on the angled support tubes.
- (b) Open the clamps in readiness for the mandrel and lower the mandrel horizontally on to the clamps.
- (3) Place the lifting ring (Tool 1121) in position on the studs in the end of the mandrel and secure with four nuts and washers.
- (4) Close and secure the clamp positioned near the lifting ring. Swivel the mandrel to the vertical position so that the serrations in the mandrel disk are uppermost. Remove the nuts from the disk studs.
- NOTE: Each clamp is secured vertically or horizontally by a plunger type pin which must be released or engaged by hand.
- (5) Assemble the lifting fixture (Tool 1120) to the HP turbine disk.
- (a) With the turbine disk on a pallet (Tool 1082) and serrations on underside, carefully lower the lifting fixture into the centre bore of the disk. Engage the support feet by turning the knurled nuts to the locked position.
- (6) Attach a crane hoist to the lifting fixture and carefully lower the turbine disk over the vertical mandrel ensuring that the serrations in the turbine disk and datum mark O align with those of the mandrel.
- (7) Carefully lower the disk over the studs in the mandrel disk and finally secure the assembly with nuts previously removed.
- (8) Remove the lifting fixture from the turbine disk.
- (9) Attach a crane hoist to the lifting fixture on the end of the mandrel. Carefully lower the assembly into the horizontal position on the mobile stand and secure the clamp.
- (10) Remove the lifting fixture from the mandrel.

OVERHAUL

- (11) Attach the crane hoist to the lifting ring (Tool 1121) on the opposite end of the mandrel and swivel the assembly to the vertical position.

B. Install Turbine Blades (Ref.Fig.505).

- (1) Assemble the mandrel and disk to the turbine disk blading fixture (Tool 1122).
  - (a) Examine the bottom surface of the turbine disk at the blade root locations to identify positions 21, 42, 63, 84 and the light spot marked 'D/L'.
  - (b) Use a suitable non-permanent marking substance to transfer the identified locations to the top surface of the disk. Ensure that the weight value at position 'D/L' is noted.
  - (c) Release the clamp securing the mandrel and transfer the assembly to the turbine disk blading fixture.
  - (d) Lower the mandrel and disk into the blading fixture and adjust the hand wheel until the top edge of the turbine disk is slightly above the top of the protective rubber on the blading fixture surface.
  - (e) Remove the crane hoist.
- (2) Place the blades in descending weight order on a suitable flat surface.
- (3) Select four blades of equal weight and enter them into the disk at positions 21, 42, 63 and 84.
- (4) Select the heaviest blade from those to be assembled and enter it into the disk at the identified 'D/L' mark.
- (5) Select a blade of weight value to counter-balance that assembled to the 'D/L' position. Insert the blade into the position opposite to the 'D/L' location.

SUB-ASSEMBLY

72-51-03

Page 513  
Dec 1/95

OLYMPUS 593

MK.610-14-28 SNECMA  
OVERHAUL

- (6) Select two blades nearest in weight value to that assembled to the 'D/L' location. Assemble each one to the turbine disk at 90 deg each side of 'D/L'.
- (7) Repeat the selection of blades in descending weight order and insert into the disk at opposite positions in order to achieve a balanced assembly.
- (8) Assemble the blades to the disc as follows:

NOTE: The HP turbine blade root to turbine disc design is such that the tolerances on manufacture are extremely tight to ensure long and satisfactory service of the turbine. However, it has been found by both practical experience and design assessment that in exceptional circumstances where the blade root and disc slots are on extremes of tolerances with regard to maximum material conditions and blade root stagger that a foul can exist on assembly. Although very few engines will experience this condition, the possibility of a foul does exist which cannot be corrected by re-machining.

- (a) When all the blades are located into their appropriate disc slots, use a suitable non-permanent marker to number the blades in accordance with its location in the disc.
- (b) Remove each blade in sequence and again place on a suitable work surface.
- (c) Adjust the hand wheel on the blading fixture so that blades can be fitted to the disc over the complete root slot width.
- (d) Apply lubricant "A" to the blade roots.
- (e) Again in sequence try each blade in its corresponding disc slot. The blade root should enter the disc slot over its complete width using hand-pressure only. Mechanical force (eg. hide mallet) should not be used.

SUB-ASSEMBLY

OVERHAUL

- (f) Should a blade not fit the disc slot using this method the blade should be replaced with one of identical weight from serviceable stores stock that will, fit the root slot. The rejected blade being returned to stock.
  - (g) Lower the mandrel and disc into the blading fixture by adjusting the hand wheel until the top edge of the turbine disc is slightly above the top of the protective rubber on the blading fixture surface.
- NOTE:** Do not insert the blade roots fully into the turbine disc in one operation as the last blade will not engage by this method. Enter the blade roots into the turbine disc in small increments.
- (h) Locate each blade in its appropriate disc slot when all the blades are entered into the disc root slots, use drive (Tool 907) and a light weight hammer to install the blades. Ensure that the point of contact with the driver is confined to the solid section of the blade root.
- (9) Adjust the hand wheel on the blading fixture to raise the turbine disk assembly slightly, then continue to insert the blades until contact with the rubber protector is made.
  - (10) Repeat the hand wheel and blade assembly procedure in gradual stages until all of the blades are fully and evenly engaged with the turbine disk.

SUB-ASSEMBLY

MK.610-14-28 *sneema*  
OVERHAUL

(11) Check the turbine blades for slackness.

- (a) Carefully check each blade for movement at the shroud interlocking joint. If movement is evident and clearance occurs at the centre section of the interlocking joints measure the gaps as follows:
  - (i) Evenly and progressively shim the gaps around the total circumference of the interlocking shroud assembly. Initially use one shim only of no more than 0.0015 in. (0,0381 mm) thickness at each gap position. If the gap is less than the shim thickness, shim alternate gaps. Progressively increase the shim thickness at each gap until the maximum thickness is achieved.

SUB-ASSEMBLY

**72-51-03**

Page 514B

Dec 1/95

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (ii) Record the mean thickness of the final shimming, this must be no greater than 0.001 in. (0,0254 mm). If the mean gap exceeds the given limit the blades are unacceptable for further engine running and must be rejected.
- (12) Carefully raise the turbine assembly out of the blading fixture. With the assembly in the vertical position secure the mandrel to the clamp on the mobile stand then carefully swivel the assembly to the horizontal position on the mobile stand and secure the clamp. Remove the lifting equipment from the end of the mandrel.
- (13) If the turbine blades slackness checks are satisfactory convey the assembly to the appropriate area for static balance checks (Ref. para.6).
- (14) If the turbine blades are rejected because of excess slackness invert the turbine assembly, remove it from the mobile stand and transfer it to the blading fixture for de-blading.
- (a) Place the blade platform stand (Tool 954) on top of the blading fixture.
- (b) Assemble the lifting fixture (Tool 1113) to the end of the mandrel. Ensure that the securing bolt is tightened. Secure the mandrel extension (Tool 1135) to the opposite end of the mandrel.
- (c) Attach a crane hoist to the lifting fixture and carefully transfer the turbine and mandrel to the blading fixture.
- (d) Lower the assembly into the blading fixture and adjust the hand wheel so that the underside of the blades are slightly above the blade platform stand.

NOTE: Owing to the interlocking turbine blade shrouds, the blades cannot be removed from the turbine disk singly in one operation.

SUB-ASSEMBLY

OVERHAUL

- (e) Using a driver (Tool 907) and a light weight hammer to remove the blades, carefully tap each blade at the solid section of the blade root to effect a gradual and even removal of the blades from the turbine disk. Adjust the hand wheel on the blading fixture to regulate the progressive disassembly of the blades.
  - (f) Identify each blade with the reason for rejection following removal from the disk. Place the blades in containers (Tool 1425). On completion of disassembly remove the rejected blades from the sub-assembly area.
- (15) Prepare the turbine disk for the assembly of replacement turbine blades.
- (a) Attach a crane hoist to the lifting fixture secured to the end of the mandrel. Carefully transfer the assembly to the mobile stand, secure the mandrel to the clamp on the mobile stand, swivel the assembly to the horizontal position and secure the clamps.
  - (b) Remove the extension (Tool 1135) from the mandrel and assemble the lifting ring (Tool 1121) to the mandrel. Remove the lifting fixture from the opposite end of the mandrel.
  - (c) Attach a crane hoist to the lifting ring and transfer the assembly to the blading fixture. Remove the blade platform stand (Tool 954) from the top of the blading fixture and carefully lower the assembly into the fixture.
- (16) Install replacement turbine blades (Ref.para.2.3.4.5).

6. Statically Balance HP Turbine Rotor

WARNING: ISOLATE BALANCING MACHINE FROM ELECTRICITY SUPPLY BEFORE COMMENCING PREPARATION, INSTALLATION, UNBALANCE RECTIFICATION OR TURBINE REMOVAL PROCEDURES.

A. Prepare Balancing Equipment.

- (1) Place the adjustable bearing (Tool 1637) in the bearing support positioned at the greater distance from the balancing machine drive shaft. Secure the adjustable bearing to the bearing support with two clamp plates and bolts (Ref.Fig.506).
- (2) Set the adjustable bearing to the mandrel diameter (Ref.Fig.506).
  - (a) Attach a crane hoist to lifting fixture (Tool 1131) and position the lifting fixture on the mandrel.
  - (b) Release the mobile stand clamps and carefully lift the turbine assembly.
  - (c) Measure the bearing location of the mandrel with adjustable bearing gauge (Tool 1641).
  - (d) Carefully lock the gauge and check that the setting has not been disturbed.
  - (e) Place the gauge on the adjustable bearing housing. Slacken the bolt securing the support arm connected to the bearing roller positioned nearest the adjustment point on the gauge.
  - (f) Carefully move the roller until it is in contact with the adjustment point on the gauge.
  - (g) Tighten the roller support arm securing bolt and check to ensure that the roller remains in contact with the gauge.
  - (h) Remove the gauge and re-position it for adjustment of the opposite roller.
  - (j) Set and lock the roller in accordance with the previously described procedure. Remove the gauge.
- (3) Assemble bearing housing and bearing to balancing machine (Ref.Fig.507).
  - (a) Place the lower half of the bearing housing (Tool 1652) in the bearing location positioned near the drive shaft on the balancing machine.
  - (b) Secure the bearing housing with two clamp plates and bolts.

- (c) Place the lower half of the slave bearing (Tool 363) into the bearing housing and secure with the retaining bolt in the bearing housing.

NOTE: The lower half of the slave bearing is identified by the oil drain hole at the bottom position.

- (4) Position the lower half of shroud (Tool 1642) between the balancing machine bearing supports in preparation to accept the turbine rotor.

B. Install HP Turbine Rotor on Balancing Machine.

- (1) Attach the lifting fixture (Tool 1131) and crane hoist to the mandrel and carefully raise the turbine assembly out of the mobile stand.
- (2) Transfer the assembly to the balancing machine.
  - (a) Carefully lower the assembly into position over the balancing machine with the mandrel disk positioned near the balancing machine shaft coupling.
  - (b) Refer to the balancing machine manufacturers instructions for information regarding the adjustment of the bearing supports and adjust the bearing supports to accommodate the installation of the HP turbine assembly. Lock the supports.
  - (c) Finally lower the turbine assembly into the bearing support. Engage the drive shaft coupling with the mandrel and secure with nuts.
  - (d) Check to ensure that the mandrel is correctly located on the slave bearing and adjustable rollers.
  - (e) Finally position the shroud half to ensure adequate clearance for the turbine rotor.
  - (f) Secure the shroud half to the balancing machine.
  - (g) Assemble upper half of slave bearing (Tool 363) to the upper half of the bearing housing (Tool 1652) and secure it with the retaining bolt in the bearing housing section.

MK.610-14-28

OVERHAUL

(h) Place the slave bearing and bearing housing upper half over the mandrel and the lower half of the assembly. Secure it with the two securing bolts.

(3) Remove the lifting fixture from the mandrel.

(4) Lubricate the slave bearing assembly with lubricant 'A' and ensure that the assembly rotates freely by hand.

(5) Install the upper half of shroud (Tool 1642).

(a) Carefully lower the shroud section into position over the turbine wheel and secure the sections together, with the hinge bolts.

#### C. Check Unbalance of HP Turbine Rotor.

(1) Operate the balancing machine in accordance with the manufacturers instructions. Maintain lubrication of bearings.

(2) Record the amount of unbalance, also the angular position of unbalance with reference to the blade position numbers.

#### D. Acceptance Limits.

(1) Provided the unbalance does not exceed 4 drn in. the disk is acceptable. Install 29 locking plates (1-40) as detailed in para.E.(4).

(2) If the unbalance is between 4 and 150 drn in., make corrections by assembling locking plates of varying weights as detailed in para.E.(1) to (5).

(3) If the unbalance is greater than 150 drn in., carry out blade position change as detailed in para.G.

#### E. Locking Plates Installation Procedure to Rectify Unbalance.

(1) Gain access to the turbine blades by raising the access panel in the top half of the shroud. If necessary remove the shroud half. Identify the angular position on the turbine disk at which the unbalance occurs.

(2) Select locking plates as given in Table 501 and calculate the approximate unbalance correction weight. The distance from the centre of the turbine disk to the locking plate positions is 13.330 in. (338.58 mm).

SUB-ASSEMBLY

72-51-03

Page 521

MK.610-15-28

OVERHAUL

- (a) Refer to SB.72-8568-163 Revision 1 before proceeding. If necessary, examine each locking plate for the hardness identification letter 'H'. Replace any unidentified plate with an identified plate of the same part number.

IPC REF. NO.	APPROX. WEIGHT (DRM IN.)	MAXIMUM NUMBER PER ASSEMBLY
(1-60)	8	4
(1-50)	5	8
(1-40)	4.5	29*

HP Turbine Blades Locking Plates Identification  
Table 501

- \* This is the total number of standard locking plates. Deduct from this the heavier plates used for balancing correction.
- (3) Use plasticine to prove the calculated unbalance correction weight as the locking plates must be finally locked in position when assembled.
- (4) Assemble locking plates to the turbine disk and blades (Ref.Fig.508).
- (a) Fully insert each locking plate under the blades securing lugs.
- (b) Use locking tools (Tool 1080 and 1081) and secure the locking plates by bending the locking legs into contact with the turbine disk locking pillars.
- (5) Secure the turbine shroud and re-check the balance of the assembly.

F. Numerically Identify Turbine Blades.

- (1) On satisfactory completion of the balance check, disconnect the mandrel from the drive shaft coupling and remove items as necessary to allow removal of the turbine assembly from the balancing machine.
- (2) Use lifting fixture (Tool 1131) to transfer the turbine assembly to the mobile stand. Secure it in the horizontal position.

OVERHAUL

- (3) Commencing at No.1 position on the turbine disk blade root, lightly vibro-etch each turbine blade root with its position number to correspond with the number on the disk.

G. Blade Re-positioning Procedure to Rectify Unbalance.

- (1) Remove the assembly from the balancing machine.
  - (a) Disconnect the mandrel from the drive shaft coupling and remove items as necessary to allow removal of the turbine assembly from the balancing machine.
  - (b) Use lifting fixture (Tool 1131) to transfer the turbine assembly to the mobile stand. Secure it in the horizontal position.
- (2) Install turbine assembly in blading fixture.
  - (a) Place blade platform stand (Tool 954) on the top of the blading fixture.
  - (b) Assemble lifting fixture (Tool 1113) to the end of the mandrel. Ensure that the securing bolt is tightened. Secure mandrel extension (Tool 1135) to the opposite end of the mandrel.
  - (c) Attach a crane hoist to the lifting fixture and carefully transfer the turbine and mandrel to the blading fixture.
  - (d) Lower the assembly into the blading fixture and adjust the hand wheel so that the underside of the blades are slightly above the blade platform stand.
- (3) Remove the blades from the turbine disk.

NOTE: Owing to the interlocking turbine blade shrouds, the blades cannot be removed from the turbine disk singly in one operation.

- (a) Use the driver (Tool 907) and a light-weight hammer to remove the blades. Carefully tap each blade at the solid section of the blade root to effect a gradual and even removal of the blades from the turbine disk. Adjust the hand wheel on the blading fixture to regulate the progressive disassembly of the blades.

- (b) On completion of the blades removal, place the blades in descending weight order on a suitable flat surface.
- (4) Remove the turbine assembly from the blading fixture, secure the lower end of the mandrel to the mobile stand clamp then carefully swivel the assembly horizontally into the stand.
- (5) Remove the mandrel extension from the end of the mandrel and assemble lifting ring (Tool 1121) to that location.
- (6) Remove the lifting fixture from the opposite end of the mandrel.
- (7) Attach a crane hoist to the lifting ring and swivel the assembly to the vertical position in the mobile stand.
- (8) Ensure that the datum position is clearly marked on the upper side of the disk also positions 21, 42, 63 and 84.
- (9) Release the clamp securing the mandrel then transfer the assembly to the turbine disk blading fixture.
- (10) Remove the blade platform stand from the top of the blading fixture.
- (11) Lower the assembly into the blading fixture and adjust the hand wheel until the top edge of the turbine disk is slightly above the top of the protective rubber on the blading fixture surface.
- (12) Remove the crane hoist.
- (13) Reposition the turbine blades in the turbine disk.
- (a) Apply lubricant 'A' to the blade roots.
- (b) Enter four blades of equal weight into positions 21, 42, 63 and 84.
- (c) Select blades of appropriate weight to correct the unbalance factor and enter each one into the disk accordingly.

OVERHAUL

- (d) When all blades are entered into the disk roots, carefully insert each blade in turn until the edge of every blade is in contact with the rubber protector on the blading fixture. Use driver (Tool 907) and a light-weight hammer to install the blades. Ensure that the point of contact with the driver is confined to the solid section of the blade root.
- (e) Adjust the hand wheel on the blading fixture to raise the turbine disk assembly slightly then continue to insert the blades until contact with the rubber protector is made.
- (f) Repeat the hand wheel and blade assembly procedure in gradual stages until all of the blades are fully and evenly engaged with the turbine disk.
- (g) Carefully raise the turbine assembly out of the blading fixture.
- (h) With the assembly in the vertical position secure the mandrel to the mobile stand clamp.
- (j) Carefully swivel the assembly to the horizontal position on to the mobile stand and secure the clamp.
- (k) Remove the lifting equipment from the mandrel.
- (l) Convey the assembly to the appropriate area for static balance checks.

H. Re-Check Static Balance of HP Turbine Rotor.

- (1) Prepare the balancing machine (Ref. para.6.A.).
- (2) Install the HP turbine rotor in the balancing machine (Ref. para.6.B.).
- (3) Check the unbalance of the HP turbine rotor (Ref. para.6.C.).
- (4) Acceptance limits (Ref. para.6.D.).
- (5) Install the locking plates to rectify unbalance (Ref. para.6.E.).

OVERHAUL

- (6) Numerically identify the turbine blades (Ref. para.6.F.).

## 7. Dimensional Checks

### A. Dimensionally Check HP Turbine Rotor.

NOTE: This procedure does not conform to module interchangeability requirement.

- (1) On engines to Pre S.B.72-94 standard place the hub unit (72-51-04/1-300) on a measuring table so that the Hirth serrations are at top position in preparation for assembly of the turbine rotor (Ref.Fig.509).
- (2) Assemble the turbine rotor to the hub.
  - (a) Secure the bolted lifting fixture (Tool 1113) to the end of the mandrel. Attach a crane hoist to the lifting fixture and swivel the assembly to the vertical position.
  - (b) Assemble the lifting fixture (Tool 1120) to the turbine disk and ensure that it is correctly locked in position. Attach a crane hoist to the lifting fixture.
  - (c) Unscrew the nuts securing the turbine disk to the mandrel, carefully lift the turbine rotor in preparation for assembly to the hub.
  - (d) Ensure thorough cleanliness of Hirth serrations. Align the serrations of the hub with the rotor, use two bolts to assist with this operation. Carefully lower the rotor on to the hub.

CAUTION: CRANE HOIST AND LIFTING FIXTURE MUST REMAIN ATTACHED TO ASSEMBLY TO PREVENT TURBINE DISK FROM FALLING SIDEWAYS THROUGH ACCIDENTAL DISTURBANCE.

- (3) Check and record dimension A from the rear face of the turbine disk to the front edge of the hub at four equally spaced positions (Ref.Fig.509). The dimension must be within the limit of 8.236 and 8.246 in. (209,194 and 209,408 mm) to be acceptable.

- (4) On completion of the dimensional check, transfer the turbine to the pallet (Tool 1082). Remove the lifting fixture from the turbine disk.

B. Dimensionally Check Turbine Hub.

NOTE: This procedure conforms to module interchangeability requirement.

- (1) On engines to S.B.72-94 standard place the turbine hub (72-51-04/1-300) on a measuring table (Ref.Fig. 509). Measure and record the length of the turbine hub from the tips of the Hirth serrations to the opposite end of the turbine hub. Record as dimension B for engine assembly reference.
- (2) Transfer the turbine rotor from the mobile stand to the pallet (Tool 1082).
  - (a) Secure the bolted lifting fixture (Tool 1113) to the end of the mandrel. Attach a crane hoist to the lifting fixture and swivel the assembly to the vertical position.
  - (b) Assemble the lifting fixture (Tool 1120) to the turbine disk and ensure that it is correctly locked in position. Attach a crane hoist to the lifting fixture.
  - (c) Unscrew the nuts securing the turbine disk to the mandrel, carefully lift the turbine rotor and transfer it to the pallet. Remove the lifting fixture.

8. Prepare Assembly for Dynamic Balance with HP Compressor Rotor Assembly

A. Assemble Labyrinth Assembly to HP Turbine Hub Unit (Ref.Fig.509).

- (1) Assemble the damping ring (72-51-04/1-290) to No.23 labyrinth seal (72-51-04/1-250).

NOTE: The damping ring and labyrinth seal are balanced and matched components.

- (a) Shrink the damping ring by use of a freezing agent.

OLYMPUS 593

MK.610-14-28

sneema

OVERHAUL

- (b) Align the balance datum marks on the damping ring and labyrinth seal. Press the damping ring fully into the labyrinth seal.
  - (c) Secure the damping ring with nuts (72-51-04/1-260), washers (72-51-04/1-270) and bolts (72-51-04/1-280). Apply lubricant 'C' to the bolts.
  - (d) Ensure that the nuts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the nuts to 100 lbf in. (11,3 N.m).
- (2) Assemble the labyrinth seal and turbine hub together, ensuring that the balance marks 0 are aligned as near as possible.
- (3) Secure the assembly together with pillar bolts (72-51-04/1-240) and self-locking nuts (72-51-04/1-230).
- (a) Apply lubricant 'C' to the bolts. Ensure that the nuts have a minimum locking (run-down) torque of 6.5 lbf in. (0,73 N.m). Torque-tighten the nuts to 210 lbf in. (24 N.m). After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 2.5 thread pitches beyond nut chamfer, the bolt must be renewed (Ref.SB.72-8444-225).
- NOTE: The unsecured ends of the pillar bolts will be used to carry balancing weights and locknuts in conjunction with later balancing requirements.
- (4) Assemble the protectors (Tool 1061, 1062 and 1063) to the turbine hub and labyrinth seal.
- (5) Ensure that each bolt (72-51-04/1-180) carries the letter T on the threaded end of the shank (Ref. SB.72-87). Reject all bolts which are not lettered.

- (6) Examine previously used bolts (72-51-04/1-180) to ascertain that each bolthead is clearly vibro-etch marked with a number from 1 to 10. If the bolts do not follow numerical sequence (1 to 10) lightly vibro-etch identification numbers on boltheads as necessary to produce the required sequence. Ensure that redundant numbers are rendered illegible. If new bolts are used lightly vibro-etch a position number (1 to 10) on the head of each bolt.
- (7) On engines to SB.72-113 standard assemble bolts (72-51-04/1-150), washers (72-51-04/1-140) and nuts (72-51-04/1-130) to the balance hole positions on No.24 and 26 labyrinth seal (Ref.Fig.510).
- (a) Apply lubricant 'C' to the securing items. Ensure that the nuts have a minimum locking (run-down) torque of 6.5 lbf in. (0,73 N.m). Torque-tighten the nuts to 210 lbf in. (24 N.m). After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 2.5 thread pitches beyond nut chamfer, the bolt must be renewed (Ref.SB.72-8444-225).
- (8) Pass the following components to the appropriate section for dynamic balance with the HP compressor rotor assembly. On completion of dynamic balance, convey the turbine rotor and loose items to the engine assembly area.

NOTE: Para.(8) applies only to pre SB.72-8305-154 Part 2 standard.

9. Turbine Rotor Swash Check and Blade Length Checking Procedure

NOTE: This procedure and para.10 and 11 are only required if the tooling introduced by SB.72-8305-154 Part 2 is available, and the HP Turbine Hub and Labyrinth Assemblies (72-51-04) are new items and require balancing with the HP Turbine Rotor or slave rotor.

A. Prepare for Swash Check (Ref.Fig.511).

- (1) Assemble the balancing mandrel (Tool 3052) to the turbine assembly/torque stand (Tool 3053). The mandrel is stored in container (Tool 3066).
  - (a) Ensure that the lifting shackle on the lifting equipment (Tool 3054) is set to the correct centre of gravity position before lifting the balancing mandrel. The lifting equipment is stored in transport stand (Tool 3055).
  - (b) Adjust the assembly stand to accept the mandrel horizontally then using lifting equipment (Tool 3054) transfer the mandrel from its transport stand to the assembly stand. Secure the mandrel to the assembly stand with four bolts securely tightened.
  - (c) Remove the lifting equipment from the mandrel and place it in the transport stand.
  - (d) Swivel the mandrel to the vertical position, with the long section of the mandrel uppermost.
- (2) Assemble the turbine hub/No.23 labyrinth seal/damping ring (72-51-04/300-250-290) to the mandrel (Ref.Fig.512).
  - (a) Remove the castellated nut and securing plate from the mandrel.
  - (b) Ensure thorough cleanliness of components, especially splines. Using an approved non-permanent marking substance, clearly identify the position of a master spline on the outer surface of the turbine hub.

- (c) Place the turbine hub assembly on the mandrel and press it as far as possible in position by hand.
  - (d) Assemble the securing plate to the mandrel/turbine hub unit and press it as far as possible in position by hand.
- (3) Press the hub in position with mechanical puller (Tool 3056) (Ref.Fig.512).
- (a) Ensure that the hydraulic cylinder is assembled to the top of the mechanical puller.
  - (b) Carefully lower the mechanical puller over the mandrel and screw the end fitting as far as possible on the securing plate. Tighten the knurled nut on the mechanical puller until the assembly is securely in position.
  - (c) Connect the hand pump to the hydraulic cylinder and carefully apply sufficient pressure to fully press the hub in position. Remove the mechanical puller from the mandrel.
  - (d) Ensure that no gap is present between the bottom of the hub and the mandrel (Ref. detail B).
- (4) Assemble the castellated securing nut to the mandrel and torque-tighten it (Ref.Fig.513).
- (a) Screw the nut in position as far as possible by hand.
  - (b) Carefully place the torque spanner (Tool 3057) over the mandrel and engage it with the nut.

- (c) Ensure that the torque multiplier (Tool 1022) adapter plate (Tool 3058) and restrainer (Tool 3059) are securely assembled together. Attach a crane hoist to the torque multiplier and carefully lower the assembly over the torque spanner assembled to the mandrel. Turn the square drive of the torque multiplier (if necessary) until engagement is achieved with the torque spanner.

**WARNING:** MAINTAIN SUPPORT OF TORQUE MULTIPLIER ASSEMBLY WITH CRANE TO PREVENT ASSEMBLY FROM DROPPING SUDDENLY.

- (d) When the restrainer is engaged with the torque spanner, continue lowering the assembly until engagement with the securing plate is achieved.
- (e) Use a suitable torque wrench and torque-tighten the mandrel nut to 300 lbf ft. (406,7 N.m).

**NOTE:** The torque multiplier has a ratio of 25 to 1; therefore the input torque must be 12 lbf ft. (16,2 N.m).

- (f) Remove the equipment.

(5) Assemble the turbine to the turbine hub.

- (a) Secure the lifting fixture (Tool 1113) to the end of the balancing mandrel (Tool 139) and tighten the securing bolt.
- (b) Attach a crane hoist to the lifting fixture and swivel the mandrel/turbine to the vertical position.
- (c) Carefully lower the lifting fixture (Tool 1120) into the centre bore of the turbine disk. Engage the support feet to the disk by turning the knurled nuts to the locked position.

- (d) Remove the knurled nuts securing the turbine disk to the mandrel and carefully raise the turbine clear of the mobile stand.
  - (e) Ensure that the Hirth serrations on the turbine disk and hub are thoroughly clean and damage free. Carefully lower the turbine on to the hub ensuring that the balance datum marks 0 on the hub and disk are aligned as near as possible. Remove the lifting fixture.
- (6) Assemble No.24 and 26 labyrinth seal to the turbine disk and secure the complete assembly with the main securing bolts (Ref.Fig.514).
- (a) Ensure that the balance datum marks 0 on the labyrinth seal are aligned as near as possible with the marks on the turbine disk. Place the labyrinth seal on the turbine disk with main bolt-holes aligned.
  - (b) Using an approved non-permanent marking substance identify the main bolt-holes numerically (1 to 10) by marking the uppermost surface of the labyrinth seal in a clockwise direction. No.1 position must be near No.1 turbine blade.
  - (c) Apply lubricant 'C' to the main securing bolts (72-51-04/1-180). Insert No.1 bolt through the turbine hub, disk and labyrinth at No.1 bolt position. Secure the bolt with a nut (72-51-04/1-120). Insert the remaining bolts in numerical sequence and secure with nuts (72-51-04/1-120).
  - (d) Torque-tighten the nuts evenly in increments of 30 lbf ft. (40,6 N.m) in the following sequence, 1, 6, 3, 8, 4, 9, 2, 7, 5, 10 until a maximum torque between 80 and 90 lbf ft. (108,5 and 122,0 N.m) is achieved. After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 2.5 thread pitches beyond nut chamfer, the bolt must be renewed (Ref.SB.72-8444-225).

- (7) Remove turbine assembly from assembly stand.
- (a) Carefully rotate the mandrel and turbine until the mandrel is in the horizontal position. Attach a crane hoist to the lifting fixture (Tool 3054). The fixture is stored in the transport stand.
  - (b) Ensure that the lifting shackle on the lifting fixture is set to the correct centre of gravity position before lifting the mandrel/turbine assembly (Ref.Fig.511).
  - (c) Position the lifting fixture on the mandrel in readiness to remove the turbine assembly from the stand. Remove the bolts securing the mandrel to the stand and carefully transfer the assembly to the transport stand. Place the lifting fixture in the transport stand.
  - (d) Transfer the assembly to the swash check area.
- (8) Prepare swash check equipment (Ref.Fig.515).
- (a) Ensure that the adjustable bearing supports (Tool 1073) and end loading fixtures (Tool 1666) are in position.
  - (b) Assemble the adjustable bearings (Tool 1637) to the supports and secure with clamping plates and retaining bolts.
  - (c) Using the lifting fixture (Tool 3054) carefully lift the turbine assembly from the transport stand and assemble the mandrel extension (Tool 1135) to the short end of the mandrel.
  - (d) Set the adjustable bearings to the mandrel diameters (Ref.Fig.515).
    - (i) Using adjustable bearing setting gauge (Tool 1641) measure the adjustable bearing location at one end of the mandrel. Carefully lock the gauge and check that the setting has not been disturbed.

- (ii) Place the gauge on the appropriate adjustable bearing housing. Slacken the bolt securing the support arm connected to the bearing roller positioned nearest the adjustment point on the gauge.
- (iii) Carefully move the roller until it is in contact with the adjustment point on the gauge.
- (iv) Tighten the roller support arm securing bolt and check to ensure that the roller remains in contact with the gauge.
- (v) Remove the gauge and reposition it for adjustment of the opposite roller.
- (vi) Set and lock the roller in accordance with the previously described procedure. Remove the gauge.
- (vii) Repeat the setting procedure for the remaining mandrel diameter and adjustable bearing.
- (e) Using lifting fixture (Tool 3054) carefully lift the turbine assembly from the transport stand. Ensure that the mandrel and adjustable bearings are clean. Lower the assembly on to the supports, tighten the bolts securing the supports to the table, then remove the lifting fixture and place it in the transport trolley.
- (f) Carefully move the end loading fixtures until light contact with each end of the mandrel is achieved. The turbine assembly must be free to rotate without axial movement.

B. Blade Length Measuring Procedure (Ref.Fig.516).

- (1) Position the No.1 blade (0 station) horizontally and set the dial indicator on the outer edge of the turbine.

OVERHAUL

- (2) Carefully rotate the turbine and note the variation of blade lengths, identify the shortest and longest blade by using an adhesive label endorsed with the actual variation. Record the dimensions and positions.

NOTE: This information is required for turbine blade tip clearance measurement during engine build.

C. Swash Measuring Procedure (Ref.Fig.516).

- (1) Commencing at No.1 turbine blade mark the turbine disk at 45 degree intervals in a clockwise direction. Use an approved non-permanent marking substance.
- (2) Position the No.1 blade (0 station) horizontally and prepare the inspection equipment to commence the check. The point of measurement is at the blade root location near the outer rim of the rotor disk.
- (3) Position two dial indicator gauges 180 degrees apart on the horizontal centre line of the turbine disk.
- (4) Carefully rotate the turbine and record the maximum variation (total dial indicator reading) measured by each dial indicator gauge, also note the angle of occurrence. The final maximum swash is obtained by calculating the average variation of these readings.
- (5) Acceptance limits.
  - (a) The maximum permissible swash measured by total dial indicator reading must be within 0.005 in. (0,1270 mm).
- (6) Remove the assembly from the bearing supports and transfer it to the transport stand.
  - (a) Attach the lifting equipment (Tool 3054) to the mandrel. Slide the end loading fixtures away from the mandrel and carefully raise the turbine assembly.

OVERHAUL

- (b) Remove the mandrel extension from the end of the mandrel and carefully lower the assembly into the transport trolley.

D. Excessive Swash Rectification Procedure.

- (1) Examine the tools and components for incorrect setting or malfunction. If necessary transfer the turbine to the assembly/torque stand (Tool 3053) for disassembly and further investigation.
- (2) Adjust the assembly stand to accept the mandrel horizontally, then using the lifting equipment (Tool 3054) transfer the mandrel to the assembly stand. Secure the mandrel to the stand with four bolts securely tightened.
- (3) Remove the lifting fixture and rotate the assembly to position the mandrel vertically with the turbine assembly uppermost.
- (4) Using cranked ring wrench (Tool 1630) slacken the main securing nuts, then remove the nuts and bolts. Carefully remove No.24 and 26 labyrinth seal and assemble protectors (Tools 1061 and 1063) to the seal.
- (5) Remove the turbine rotor for examination of Hirth serrations.
  - (a) With the knurled nuts of the lifting fixture (Tool 1120) in the unlocked position carefully lower the lifting fixture into the centre bore of the disk and engage the support feet under the disk by turning the knurled nuts to the locked position.
  - (b) Attach a crane hoist to the lifting fixture and carefully raise the rotor.

SUB-ASSEMBLY

OVERHAUL

- (c) Examine the Hirth serrations on the turbine disk and hub for possible cause of incorrect swash. Carefully lower the turbine disk on to a pallet (Tool 1082), or if the turbine is to be transported for further investigation, assemble it to the balancing mandrel (Tool 139) and mobile stand (Tool 1111).
- (i) Secure the lifting fixture (Tool 1113) to the end of the balancing mandrel (Tool 139) and tighten the securing bolt.
  - (ii) Attach a crane hoist to the lifting fixture and swivel the mandrel in the mobile stand to the vertical position.
  - (iii) Carefully lower the turbine disk over the mandrel and secure it with the knurled nuts and retaining bolts. Remove the crane hoist and turbine disk lifting fixture.
  - (iv) Using a crane hoist carefully swivel the mandrel/turbine on to the mobile stand. Secure the clamps and remove the crane hoist.
- (6) If the reason for excessive swash has not been established remove the turbine hub for examination.
- (a) Carefully place the torque spanner (Tool 3057) over the mandrel and engage it with the castelated nut.
  - (b) Attach a crane hoist to the torque multiplier assembly (Tools 1022, 3058 and 3059) and carefully lower the assembly over the torque spanner assembled to the mandrel. Turn the square drive of the torque multiplier (if necessary) until engagement is achieved with the torque spanner.

**WARNING:** MAINTAIN SUPPORT OF TORQUE MULTIPLIER ASSEMBLY WITH CRANE TO PREVENT ASSEMBLY FROM DROPPING SUDDENLY.

- (c) When the immobilizer is engaged with the torque spanner, continue lowering the assembly until engagement with the securing plate is achieved.
  - (d) Using a suitable wrench spanner, slacken the castellated securing nut. Remove the tools and unscrew the turbine hub nut.
  - (e) Remove the securing plate with the mechanical puller (Tool 3056).
    - (i) Ensure that the hydraulic cylinder is assembled in the bottom position (Ref. Fig.512, detail A).
    - (ii) Carefully lower the mechanical puller over the mandrel and screw the end fitting as far as possible on the securing plate. Tighten the knurled nut on the mechanical puller until the tool is securely in position.
    - (iii) Connect the hand pump to the hydraulic cylinder and carefully apply sufficient pressure to remove the securing plate. Remove the mechanical puller and securing plate from the mandrel.
  - (f) Carefully place the turbine hub lifting/extracting fixture (Tool 1057) over the mandrel and secure it with the turbine securing bolts and slave nuts (attached to the fixture). Turn the handle of the tool to remove the turbine hub from the mandrel (Ref.Fig.517).
  - (g) On completion of the turbine hub extraction procedure remove the tool and detach the turbine hub. Examine the turbine hub for possible cause of excessive swash.
- (7) On completion of excessive swash investigation, reassemble the turbine hub, disk and labyrinth and repeat the swash checks (Ref.para.9. A and C.)

10. Statically Balance the Turbine Hub Using a Bladed Turbine Disk

NOTE: If a bladed turbine disk is not available, a slave disk (Tool 3067) may be used (Ref.para.11).

WARNING: ISOLATE BALANCING MACHINE FROM ELECTRICITY SUPPLY BEFORE COMMENCING PREPARATION, INSTALLATION OR TURBINE REMOVAL PROCEDURES.

A. Prepare Equipment (Ref.Fig.518).

- (1) Refer to the balancing machine manufacturer's information for details of machine operation, calibration and adjustment (Avery 72 E-8).
- (2) Position the lower half of the shroud (Tool 3068) between the balancing machine bearing supports in preparation to accept the turbine rotor. Loosely assemble the bolts securing the shroud to the base of the machine.
- (3) Using lifting equipment (Tool 3054), carefully raise the mandrel and turbine assembly from the transport stand and position it in readiness for installation in the balancing machine.
- (4) Set the adjustable roller bearings on the balancing machine to suit the corresponding diameters of the mandrel.
- (5) Adjust the distance between pedestals to accept the mandrel and turbine assembly. Ensure thorough cleanliness of the mandrel and adjustable roller bearings and carefully lower the assembly on to the rollers.
- (6) Apply lubricant 'A' to the bearings and check that the assembly rotates freely.
- (7) Secure the drive shaft coupling to the end of the mandrel. Remove the lifting equipment.

- (8) Check that adequate clearance exists between the turbine and lower half of the shroud, then tighten the bolts securing the shroud to the balancing machine. Assemble the upper half of the shroud to the lower half.
  - (9) Position the bridge guards over the mandrel and adjustable rollers. Ensure that a small clearance exists between the guards and mandrel then tighten the securing nuts.
- B. Statically Balance Turbine Hub Using Turbine Disk Assembly. (Ref.Fig.519).
- (1) Using plasticine, correct the static unbalance at position FT to within 1 dram inch.
  - (2) Turn the turbine 180 degrees in relation to the mandrel.
    - (a) Switch off the electricity supply and isolate the balancing machine.
    - (b) Disconnect the mandrel from the drive shaft coupling and remove items as necessary to allow removal of the turbine assembly from the balancing machine. Using the lifting fixture (Tool 3054), set to the correct centre of gravity, transfer the turbine assembly to the transport stand (Tool 3055) and convey the assembly to the assembly/torque stand (Tool 3053).
    - (c) Adjust the assembly stand to accept the mandrel horizontally then using the lifting fixture (Tool 3054) transfer the mandrel to the assembly stand. Secure the mandrel to the stand with four bolts securely tightened.
    - (d) Remove the lifting fixture and rotate the assembly to position the mandrel vertically with the turbine assembly uppermost.
    - (e) Carefully place the torque spanner (Tool 3057) over the mandrel and engage it with the nut.

TN49025

OVERHAUL

- (f) Attach a crane hoist to the torque multiplier assembly (Tools 1022, 3058 and 3059) and carefully lower the assembly over the torque spanner assembled to the mandrel. Turn the square drive of the torque multiplier (if necessary) until engagement is achieved with the torque spanner.

**WARNING:** MAINTAIN SUPPORT OF TORQUE MULTIPLIER ASSEMBLY WITH CRANE TO PREVENT ASSEMBLY FROM DROPPING SUDDENLY.

- (g) When the restrainer is engaged with the torque spanner continue lowering the assembly until engagement with the securing plate is achieved.
- (h) Using a suitable wrench spanner, slacken the turbine hub securing nut. Remove the tools and unscrew the turbine hub nut.
- (j) Using mechanical puller (Tool 3056) remove the securing plate.
- (i) Ensure that the hydraulic cylinder is assembled in the bottom position (Ref. Fig.512, detail A).
- (ii) Attach a crane hoist to the mechanical puller and carefully lower the tool over the mandrel. Screw the end fitting as far as possible on the securing plate. Tighten the knurled nut on the mechanical puller until the assembly is securely in position.
- (iii) Connect the hand pump to the hydraulic cylinder and carefully apply sufficient pressure to separate the securing plate from the mandrel.

PRINTED IN ENGLAND

- (iv) Using the crane hoist attached to the mechanical puller raise the turbine assembly clear of the splines on the mandrel. Note the position of the spline marked externally on the turbine hub then turn the turbine assembly 180 degrees relative to the mandrel. Lower the assembly as far as possible on to the mandrel and ensure that it cannot drop involuntarily.
- (k) Press the turbine assembly on to the mandrel with mechanical puller (Tool 3056).
  - (i) Assemble the hydraulic cylinder to the top of the mechanical puller.
  - (ii) Ensure that the securing plate is correctly in position on the mandrel and that the mechanical puller is screwed on to it. Also tighten the knurled nut on the tool until the assembly is securely in position.
  - (iii) Carefully apply sufficient hydraulic pressure to the cylinder to fully press the turbine assembly in position on the mandrel.
  - (iv) Ensure that no gap is present between the bottom of the hub and the mandrel. Remove the mechanical puller from the turbine.
- (l) Assemble the castellated securing nut to the mandrel and torque-tighten it (Ref.para.9.A.(4)).
- (m) Adjust the assembly stand to position the mandrel horizontally. Using the lifting equipment (Tool 3054) transfer the turbine/mandrel assembly to the transport stand (Tool 3055). Convey the assembly to the balancing machine and install it (Ref.para.10.A.) for continuation of balancing procedure.

- (3) Measure the static unbalance at position FT.  
Acceptance limit/correction procedure is as follows.
- (a) If the static unbalance is within 30 dram inches continue with the procedure detailed in para.(6).
  - (b) If the static unbalance exceeds 30 dram inches correct half of this unbalance at the angle of error at position FT. Correct the remaining unbalance by applying plasticine to the mandrel.
  - (c) Turn the turbine assembly 180 degrees to its original position on the mandrel (Ref.para.B.(2)). The plasticine must remain in position.
- (4) Measure the static unbalance of the assembly, if this is within 30 dram inches continue with the procedure detailed in para.(6).
- (5) If the unbalance measured in (4) exceeds 30 dram inches, remove the turbine from the mandrel and inspect the turbine hub and mandrel splines for excessive clearance at diameters A and B.
- (a) Switch off the electricity supply and isolate the balancing machine.
  - (b) Disconnect the mandrel from the drive shaft coupling and remove items as necessary to allow removal of the turbine assembly from the balancing machine. Using the lifting equipment (Tool 3054) set to the correct centre of gravity, transfer the turbine assembly to the transport stand (Tool 3055) and convey the assembly to the assembly/torque stand (Tool 3053).
  - (c) Adjust the assembly stand to accept the mandrel horizontally then, using the lifting equipment (Tool 3054), transfer the mandrel to the stand. Secure the mandrel to the stand with four bolts securely tightened.

- (l) Ensure that the hydraulic cylinder of mechanical puller (Tool 3056) is assembled in the bottom position (Ref.Fig.512, detail A). Carefully lower the tool over the mandrel and screw the end fitting as far as possible on the securing plate. Tighten the knurled nut on the mechanical puller until the tool is securely in position.
- (m) Connect the hand pump to the hydraulic cylinder and carefully apply sufficient pressure to separate the securing plate from the mandrel. Remove the mechanical puller and securing plate from the mandrel.
- (n) Carefully place the turbine hub lifting/extracting fixture (Tool 1057) over the mandrel and secure it to the hub with the turbine securing bolts and slave nuts (attached to the fixture). Turn the handle of the tool to remove the turbine hub from the mandrel.
- (p) On completion of the turbine hub extraction procedure remove the tool and detach the turbine hub.
- (q) Measure the drive shaft location bore in the turbine hub (Ref. Inspection/Check, 72-51-04, para.6.). Also measure the corresponding diameter on the mandrel. Maximum permissible assembly clearance = 0.0001 in. (0,003 mm).
- (r) On completion of investigation and rectification assemble the turbine hub, disk and labyrinth and repeat the swash checks (Ref. para.9.A. and C.).
- (s) On completion of satisfactory swash check repeat the static balancing procedure (Ref. para.10).
- (6) Remove the plasticine from position FT but do not remove the correction applied to the mandrel. Measure the initial unbalance.
  - (a) If the initial unbalance is in excess of 250 dram inches, recheck the static unbalance of the bladed turbine disk (Ref. para.6).

(m) If the initial unbalance is within limits (Ref. para.(6) (a)), pass the following components to the engine assembly area.

- (i) No.23 labyrinth seal/damping ring/  
turbine hub assembly (72-51-04/  
1-250-290-300) (1)
- (ii) Turbine assembly (1)
- (iii) Bolts (72-51-04/1-180) (10)
- (iv) Nuts (72-51-04/1-120) (10)
- (v) Retaining rings (72-51-04/1-170) (10)
- (vi) Labyrinth seal No.24 and 26 (1)

(8) If the initial unbalance is not within limits (Ref. para.(6) (a)) recheck the static unbalance of the bladed turbine disk.

(a) Remove the turbine assembly from the balancing machine and separate the turbine hub, bladed disk and No.24 and 26 labyrinth (Ref. para.(5) (a), (b), (c), (d) and (e)).

(b) Prepare the balancing mandrel (Tool 139) to accept the bladed disk.

(i) Ensure that the mandrel is secured to the mobile stand (Tool 1111). Secure the lifting fixture (Tool 1113) to the end of the balancing mandrel and tighten the securing bolt.

(ii) Attach a crane hoist to the lifting fixture on the end of the mandrel and raise the mandrel to the vertical position.

(c) With the knurled nuts of the lifting fixture (Tool 1120) in the unlocked position, carefully lower the lifting fixture into the centre bore of the disk and engage the support feet under the disk by turning the knurled nuts to the locked position.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (d) Ensure that the Hirth serrations on the mandrel are thoroughly clean. Attach a crane hoist to the lifting fixture attached to the turbine disk and carefully lower the assembly over the vertical mandrel ensuring that the serrations on the turbine disk and datum mark → 0 ← align with those of the mandrel.
  - (e) Carefully lower the turbine disk over the studs in the mandrel disk and finally secure the assembly with the mandrel nuts.
  - (f) Attach a crane hoist to the lifting fixture on the end of the mandrel. Carefully lower the assembly into the horizontal position on the mobile stand. Remove the lifting fixture from the mandrel.
  - (g) Convey the assembly to the static balancing area.
- (9) Statically balance HP turbine rotor (Ref. para.6.).
- NOTE: If it is necessary to remove turbine blades locking plates, use locking tools (Tools 1080 and 1081).
- (10) Check swash of turbine rotor (Ref. para.9.).
- (11) Statically balance turbine hub (Ref. para.10.).

#### 11. Statically Balance Turbine Hub Using Slave Turbine Disk

NOTE: For balancing purposes the slave turbine disk is an alternative to the bladed turbine disk. This procedure applies only to SB.72-8305 standard and conforms to module interchangeability requirement.

##### A. Assemble the Slave Disk Turbine Hub and Mandrel.

- (1) Assemble the balancing mandrel (Tool 3052) to the turbine assembly/torque stand (Tool 3053), (Ref. para.9.A.(1)).

TN49034

- (2) Assemble the turbine hub to the mandrel (Ref. para.9.A.(2)).
- (3) Press the hub in position with mechanical puller (Ref. para.9.A.(3)).
- (4) Assemble the castellated nut to the mandrel and torque-tighten it (Ref. para.9.A.(4)).
- (5) Assemble the slave turbine disk (Tool 3067) to the turbine hub.

NOTE: The slave turbine disk is stored in container (Tool 3069).

- (a) Carefully lower the lifting fixture (Tool 1120) into the centre bore of the slave turbine disk. Engage the support feet to the disk by turning the knurled nuts to the locked position.
- (b) Carefully raise the slave disk out of the transport container and ensure that the Hirth serrations on the disk and hub are thoroughly clean and damage free.
- (c) Lower the slave turbine on to the hub ensuring that the balance datum marks 0 on the hub and disk are aligned as near as possible. Remove the lifting fixture.
- (6) Secure the turbine hub and slave disk together with the main securing bolts. This procedure is similar to that shown (Ref.Fig.514).
- (a) Using an approved non-permanent marking substance identify the main securing bolt-holes numerically (1 to 10) by marking the uppermost surface of the slave turbine disk in a clockwise direction.
- (b) Apply lubricant 'C' to the main securing bolts, insert the bolts in numerical sequence into the appropriately marked holes and secure with nuts (72-51-04/1-120).

OLYMPUS 593

MK.610-14-28

- (c) Torque-tighten the nuts evenly in increments of 30 lbf ft. (40,6 N.m) in the following sequence, 1, 6, 3, 8, 4, 9, 2, 7, 5, 10 until a torque between 80 and 90 lbf ft. (108,5 and 122,0 N.m) is achieved.
- (7) Remove the slave disk and hub assembly from the assembly stand.
- (a) Carefully rotate the mandrel and slave disk until the mandrel is in the horizontal position. Attach a crane hoist to the lifting equipment (Tool 3054). The lifting equipment is stored in the transport stand (Tool 3055).
  - (b) Ensure that the lifting shackle on the lifting equipment is set to the correct centre of gravity position before lifting the mandrel/slave disk assembly.
  - (c) Position the lifting equipment on the mandrel in readiness to remove the turbine assembly from the stand. Remove the bolts securing the mandrel to the stand and carefully transfer the assembly to the transport stand. Place the lifting fixture in the transport stand and convey the assembly to the static balancing area.
- B. Prepare for Static Balance Check (Ref.Fig.518).
- WARNING: ISOLATE BALANCING MACHINE FROM ELECTRICITY SUPPLY BEFORE COMMENCING PREPARATION INSTALLATION OR TURBINE REMOVAL PROCEDURES.
- (1) Refer to the balancing machine manufacturer's information for details of machine operation calibration and adjustment (Avery 72 E-8).
  - (2) Position the lower half of the shroud (Tool 3068) between the balancing machine bearing supports in preparation to accept the turbine rotor. Loosely assemble the bolts securing the shroud to the base of the machine.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (3) Using lifting equipment (Tool 3054) carefully raise the mandrel and turbine assembly from the transport stand and position it in readiness for installation in the balancing machine.
- (4) Set the adjustable roller bearings on the balancing machine to suit the corresponding diameters of the mandrel.
- (5) Adjust the distance between the supports to accept the mandrel and turbine assembly. Ensure thorough cleanliness of the mandrel and adjustable roller bearings and carefully lower the assembly on to the rollers.
- (6) Apply lubricant 'A' to the bearings and check that the assembly rotates freely.
- (7) Secure the drive shaft coupling to the end of the mandrel. Remove the lifting equipment.
- (8) Check that adequate clearance exists between the slave turbine disk and lower half of the shroud then tighten the bolts securing the shroud to the balancing machine. Assemble the upper half of the shroud to the lower half.
- (9) Position the bridge guards over the mandrel and adjustable rollers. Ensure that a small clearance exists between the guards and mandrel then tighten the securing nuts.

#### C. Static Balancing Procedure.

- (1) Using plasticine correct the static unbalance at position FT to within 1 dram inch.
- (2) Turn the slave turbine disk 180 degrees in relation to the turbine hub.
  - (a) Switch off the electricity supply and isolate the balancing machine.

SUB-ASSEMBLY

OVERHAUL

- (b) Disconnect the mandrel from the drive shaft coupling and remove items as necessary to allow removal of the assembly from the balancing machine. Using the lifting fixture (Tool 3054) set to the correct centre of gravity, transfer the assembly to the transport stand (Tool 3055) and convey the assembly to the assembly/torque stand (Tool 3053).
- (c) Adjust the assembly stand to accept the mandrel horizontally, then using the lifting fixture (Tool 3054) transfer the mandrel to the assembly stand. Secure the mandrel to the stand with four bolts securely tightened.
- (d) Remove the lifting fixture and rotate the assembly to position the mandrel vertically with the turbine assembly uppermost.
- (e) Using cranked ring wrench (Tool 1630) slacken the main securing nuts then remove the nuts and bolts.
- (f) Carefully lower the lifting fixture (Tool 1120) into the centre bore of the disk and engage the support feet to the disk by turning the knurled nuts to the locked position.
- (g) Note the position of the slave turbine disk in relation to the hub. Attach a crane hoist to the slave disk and carefully raise it clear of the hub. Turn the slave disk 180 degrees on the hub and lower it on to the hub.
- (h) Apply lubricant 'C' to the main securing bolts, insert the bolts in numerical sequence into the appropriately marked holes and secure with the nuts.
- (j) Torque-tighten the nuts evenly in increments of 30 lbf ft. (40,6 N.m) in the following sequence, 1, 6, 3, 8, 4, 9, 2, 7, 10 until a torque of between 80 and 90 lbf ft. (108,5 and 122,0 N.m) is achieved.

SUB-ASSEMBLY

MK.610-14-28  
OVERHAUL

- (3) Carefully rotate the mandrel and slave disk until the mandrel is in the horizontal position. Attach a crane hoist to the lifting equipment (Tool 3054). Ensure that the lifting shackle on the lifting equipment is set to the correct centre of gravity position before lifting the mandrel/slave disk.
- (4) Transfer the mandrel/slave disk to the transport stand (Tool 3055) and convey the assembly to the balancing machine for installation and continuation of balancing procedure.
- (5) Check the static unbalance of the assembly at position FT. If the unbalance is in excess of 10 dram inches, correct half of this unbalance at the angle of error at position FT. Correct the remaining unbalance by applying plasticine to the slave turbine disk.
- (6) Turn the slave turbine 180 degrees in relation to the mandrel.
  - (a) Switch off the electricity supply and isolate the balancing machine.
  - (b) Disconnect the mandrel from the drive shaft coupling and remove items as necessary to allow removal of the assembly from the balancing machine. Using the lifting fixture (Tool 3054) set to the correct centre of gravity, transfer the assembly to the transport stand (Tool 3055) and convey the assembly to the assembly/torque stand (Tool 3053).
  - (c) Adjust the assembly stand to accept the mandrel horizontally then using the lifting fixture (Tool 3054) transfer the mandrel to the assembly stand. Secure the mandrel to the stand with four bolts securely tightened.
  - (d) Remove the lifting fixture and rotate the assembly to position the mandrel vertically with the slave turbine uppermost.

- (e) Carefully place the torque spanner (Tool 3057) over the mandrel and engage it with the nut.
- (f) Attach a crane hoist to the torque multiplier assembly (Tools 1022, 3058 and 3059) and carefully lower the assembly over the torque spanner assembled to the mandrel. Turn the square drive of the torque multiplier (if necessary) until engagement is achieved with the torque spanner.

WARNING: MAINTAIN SUPPORT OF TORQUE MULTIPLIER ASSEMBLY WITH CRANE TO PREVENT ASSEMBLY FROM DROPPING SUDDENLY.

- (g) When the restrainer is engaged with the torque spanner, continue lowering the assembly until engagement with the securing plate is achieved.
- (h) Using a suitable wrench spanner, slacken the turbine hub securing nut. Remove the tools and unscrew the turbine hub nut.
- (j) Using mechanical puller (Tool 3056) remove the securing plate.
  - (i) Ensure that the hydraulic cylinder is assembled in the bottom position (Ref. Fig.512, detail A).
  - (ii) Attach a crane hoist to the mechanical puller and carefully lower the tool over the mandrel. Screw the end fitting as far as possible on the securing plate. Tighten the knurled nut on the mechanical puller until the assembly is securely in position.
  - (iii) Connect the hand pump to the hydraulic cylinder and carefully apply sufficient pressure to separate the securing plate from the mandrel.

OVERHAUL

- (iv) Using the crane hoist attached to the mechanical puller raise the assembly clear of the splines on the mandrel. Note the position of the spline marked externally on the turbine hub then turn the assembly 180 degrees relative to the mandrel. Lower the assembly as far as possible on to the mandrel and ensure that it cannot drop involuntarily.
- (k) Press the assembly on to the mandrel with mechanical puller (Tool 3056).
- (i) Assemble the hydraulic cylinder to the top of the mechanical puller.
- (ii) Ensure that the securing plate is correctly in position on the mandrel and that the mechanical puller is screwed on to it. Also tighten the knurled nut on the tool until the assembly is securely in position.
- (iii) Carefully apply sufficient hydraulic pressure to the cylinder to fully press the assembly in position on the mandrel.
- (iv) Ensure that no gap is present between the bottom of the hub and the mandrel. Remove the mechanical puller from the turbine.
- (l) Assemble the castellated securing nut to the mandrel and torque-tighten it (Ref. para.9.A. (4)).
- (m) Adjust the assembly stand to position the mandrel horizontally. Using the lifting equipment (Tool 3054) transfer the assembly to the transport stand (Tool 3055). Convey the assembly to the balancing machine and install it (Ref. para.10.A.). for continuation of balancing procedure.
- (7) Measure the static unbalance at position FT. Acceptance limit/correction procedure is as follows.

SUB-ASSEMBLY

72-51-03

Page 569

OVERHAUL

- (a) If the static unbalance is within 30 dram inches, continue with the procedure detailed in para.(8).
- (b) If the static unbalance exceeds 30 dram inches, correct half of this unbalance at the angle of error at position FT. Correct the remaining unbalance by applying plasticine to the mandrel.
- (c) Turn the turbine 180 degrees to its original position (Ref.para.(6)). The plasticine must remain in position.
- (d) Measure the static unbalance of the assembly, if this is within 30 dram inches, continue with the procedure detailed in para.(8).
- (e) If the unbalance measured in (d) exceeds 30 dram inches, remove the slave turbine disk from the mandrel and inspect the turbine hub and mandrel splines for excessive clearance at diameters A and B (Ref.Fig.519).
  - (i) Switch off the electricity supply and isolate the balancing machine.
  - (ii) Disconnect the mandrel from the drive shaft coupling and remove items as necessary to allow removal of the slave turbine from the balancing machine. Using the lifting equipment (Tool 3054) set to the correct centre of gravity, transfer the assembly to the transport stand (Tool 3055) and convey the assembly to the assembly/torque stand (Tool 3053).
  - (iii) Adjust the assembly stand to accept the mandrel horizontally, then using the lifting equipment (Tool 3054) transfer the mandrel to the stand. Secure the mandrel to the stand with four bolts securely tightened.

- (iv) Remove the lifting equipment and rotate the assembly to position the mandrel vertically with the slave turbine disk uppermost.
- (v) Using the cranked ring wrench (Tool 1630) slacken the main securing nuts then remove the nuts and bolts.
- (vi) Carefully lower the lifting fixture (Tool 1120) into the centre bore of the slave turbine disk and engage the support feet under the disk by turning the knurled nuts to the locked position.
- (vii) Attach a crane hoist to the lifting fixture and carefully transfer the slave disk assembly.
- (viii) Carefully place the torque spanner (Tool 3057) over the mandrel and engage it with the turbine hub securing nut. Attach a crane hoist to the torque multiplier assembly (Tools 1022, 3058 and 3059) and carefully lower the assembly over the torque spanner. Turn the square drive of the torque multiplier (if necessary) until engagement is achieved by the torque spanner.
- WARNING:** MAINTAIN SUPPORT OF TORQUE MULTIPLIER ASSEMBLY WITH CRANE TO PREVENT ASSEMBLY FROM DROPPING SUDDENLY.
- (ix) When the immobilizer is engaged with the torque spanner, continue lowering the assembly until engagement with the securing plate is achieved.
- (x) Using a suitable wrench spanner, slacken the turbine hub securing nut. Remove the tools, unscrew and remove the turbine hub securing nut.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (xi) Ensure that the hydraulic cylinder of mechanical puller (Tool 3056) is assembled in the bottom position (Ref. Fig.512, detail A). Carefully lower the tool over the mandrel and screw the end fitting as far as possible on the securing plate. Tighten the knurled nut on the mechanical puller until the tool is securely in position.
- (xii) Connect the hand pump to the hydraulic cylinder and carefully apply sufficient pressure to separate the securing plate from the mandrel. Remove the mechanical puller and securing plate from the mandrel.
- (xiii) Carefully place the turbine hub lifting/extracting fixture (Tool 1057) over the mandrel and secure it to the hub with the turbine securing bolts and slave nuts (attached to the fixture). Turn the handle of the tool to remove the turbine hub from the mandrel.
- (xiv) On completion of the turbine hub extraction procedure, remove the tool and detach the turbine hub.
- (xv) Measure the drive shaft location bore in the turbine hub (Ref. Inspection/Check, 72-51-04, para.6). Also measure the corresponding diameter on the mandrel. Maximum permissible assembly clearance = 0.0001 in. (0,003 mm).
- (xvi) On completion of investigation and rectification, assemble the slave disk, turbine hub and mandrel (Ref. para.11.A.) and repeat the static balancing procedure (Ref. para.11. B and C).

- (8) Remove the plasticine from position FT but do not remove the correction applied to the mandrel. Measure the initial unbalance.
  - (a) If the initial unbalance is in excess of 250 dram inches, it will be necessary to recheck the static unbalance of the slave turbine disk.
  - (b) If the initial unbalance is within 250 dram inches, balance out to within 4 dram inches by assembling weights to position FT (Ref. Table 502 and Fig.519).
  - (c) Apply lubricant 'C' where appropriate to the bolt threads at position FT. Assemble balancing weights to position FT and secure with nuts (72-51-04/1-190). Ensure that the nuts have a minimum locking (run-down) torque of 6.5 lbf in. (0,73 N.m). Torque-tighten the nuts to 210 lbf in. (24 N.m).
  - (d) Record the remaining couple unbalance at any two planes 10 inches (254,000 mm) apart.
- (9) Remove the slave turbine disk assembly from the balancing machine and separate the turbine hub from the disk.
  - (a) Switch off the electricity supply and isolate the balancing machine. Disconnect the mandrel from the drive shaft coupling and remove items as necessary to allow removal of the slave turbine assembly from the balancing machine. Using the lifting equipment (Tool 3054) set to the correct centre of gravity, transfer the turbine assembly to the transport stand (Tool 3055). Convey the assembly to the assembly/torque stand (Tool 3053).
  - (b) Adjust the assembly stand to accept the mandrel horizontally, then using the lifting equipment transfer the mandrel to the assembly stand. Secure the mandrel to the stand with four bolts securely tightened.

- (c) Remove the lifting fixture and rotate the assembly to position the mandrel vertically with the slave turbine uppermost.
- (d) Using cranked ring wrench (Tool 1630) slacken the main securing nuts and remove the nuts and bolts.
- (e) With the knurled nuts of the lifting fixture (Tool 1120) in the unlocked position, carefully lower the lifting fixture into the centre bore of the disk and engage the support feet under the disk by turning the knurled nuts to the locked position. Attach a crane hoist to the lifting fixture and remove the slave turbine disk from the hub. Carefully lower the slave turbine disk on to the pallet (Tool 1082).
- (f) Carefully place the torque spanner (Tool 3057) over the mandrel and engage it with the nut.
- (g) Attach a crane hoist to the torque multiplier assembly (Tools 1022, 3058 and 3059) and carefully lower the assembly over the torque spanner assembled to the mandrel. Turn the square drive of the torque multiplier (if necessary) until engagement is achieved with the torque spanner.

WARNING: MAINTAIN SUPPORT OF IMMOBILIZER  
ASSEMBLY WITH CRANE TO PREVENT  
ASSEMBLY FROM DROPPING SUDDENLY.

- (h) When the immobilizer is engaged with the torque spanner continue lowering the assembly until engagement with the securing plate is achieved.
- (j) Using a suitable wrench spanner, slacken the turbine hub securing nut. Remove the tools and the turbine hub securing nut.

## LP TURBINE NOZZLE - SUB-ASSEMBLY

### 1. General

- A. Prior to commencing assembly, refer to 72-09-00, Assembly for general information.
- B. During the sub-assembly procedure reference will be made to the Illustrated Parts Catalogue (I.P.C.) to identify those items where the nomenclature does not positively identify them due to duplication of title e.g. nuts, bolts, washers etc. Where the item is part of this text it will be identified as e.g. bolt (1-10), the 1 referring to the I.P.C. Fig.No. and the 10 referring to the Item No.
- C. Throughout the text special tools are quoted by their Ref.No. e.g. (Tool 1234). For a complete list of tooling required for the assembly, and for the Manufacturers Part No. refer to the Special Tools, Fixtures and Equipment Table 1002.
- D. The LP turbine nozzle is composed of 24 nozzle vanes assembled to a centrally positioned diaphragm. Measurements are recorded at each nozzle vane and the total air flow throat area is calculated. On completion of assembly the nozzle is placed on a transportation table by use of a lifting fixture incorporating retaining hooks which engage with each vane. The lifting fixture remains attached to the nozzle until it is assembled to an engine.

### 2. LP Turbine Nozzle Assembly

- A. Prepare Nozzle Vane Support Diaphragm (Ref. Fig.501).
  - (1) Insert twelve cover retaining bolts (1-40) through the flange in the rear section of the diaphragm (1-120). Ensure that the bolt heads are correctly positioned on the flange. Secure each bolt with a retaining ring (1-30A) use assembly sleeve (Tool 1321) to assemble them to the bolts.
  - (2) Place the diaphragm into an oven and heat to a temperature of 100 deg C for 15 minutes. Prepare a suitable flat surface as near as possible to the oven and on completion of the given heating time remove the diaphragm from the oven and place it on the prepared surface with the installed bolts uppermost. Wear suitable protective gloves when handling the heated component.

SNECMA

- (3) Place the cover unit (1-10) in position on the diaphragm ensuring that the two short tube sections on the outer diameter of the cover unit are aligned with the holes in the diaphragm. Evenly press the cover fully into position on the diaphragm, and temporarily secure with four nuts equally spaced.
- (4) Apply lubricant 'C' to the bolt threads and finally secure the cover to the diaphragm with twelve nuts (1-20) torque-tightened to 100 lbf in. (11,5 N.m).
- (5) Check dimension B between the short tube sections on outer diameter of the cover and the diaphragm. Minimum clearance 0.080 in. (2,032 mm).
- (6) Assemble six retaining plates (1-70) to the twin hole locations on the inner flange of the diaphragm.
  - (a) Position each retaining plate so that the flat side locates on the flange and the chamfer overlaps the machined section of the labyrinth ring.
  - (b) Insert two bolts (1-60) through each retaining plate with the flat edge section of each bolt located against the raised section of the retaining plate.
  - (c) Apply lubricant 'C' to the bolt threads and secure the bolts with nuts (1-50) torque-tightened to 100 lbf in. (11,5 N.m).

#### B. Separate and Identify Nozzle Vanes.

- (1) Examine all original nozzle vane assemblies on the outer section between the vane ends for their position number, then lay the vanes out in numerical sequence leaving spaces for any replacement vane assemblies.
- (2) Check replacement vane assemblies to ensure that they are to the same SB. or Mod. standard as the original vanes, by checking that their Part Numbers are the same as the original vanes dependent on their respective position as detailed in Table 501.
- (3) With reference to Table 501, position the replacement vane assemblies in their correct positions, then lightly vibro etch the appropriate position number on the outer section between the vane ends on each vane assembly.

## C. Assemble Nozzle Vanes to Support Diaphragm (Ref.Fig.502).

- (1) Assemble the support diaphragm to the assembly tool (Tool 3071).
  - (a) Carefully raise the centre block section of the tool and assemble the diaphragm to it. Ensure that the diaphragm is fully and evenly positioned on the centre block.
- (2) Assemble turbine nozzle vanes to the diaphragm.

NOTE: Position marked 'TOP' on diaphragm is No.1 nozzle vane location. Nozzle vanes are positioned in numerical sequence in the clockwise direction when viewed from the rear.

- (a) Commencing at No.24 vane position, engage the 'V' section recess of the nozzle vane with the lip on the diaphragm.
- (b) Assemble the remaining nozzle vanes in numerical sequence.

NOTE: The vanes at positions 11 and 14 contain a thermocouple locating tube which aligns with a location in the diaphragm. No.13 vane incorporates a hole for an internal inspection probe.

OVERHAUL

- (3) Ensure that all vanes are in position on the diaphragm then carefully lower the diaphragm and centre block until the nozzle vanes are fully engaged with the diaphragm.
- (4) If nozzle area throat gap checks are to be carried out, continue with the procedure of paragraph 3. If checks are not required, secure the module identification plate to the nozzle assembly then transfer the nozzles to engine assembly (72-00-00, Assembly).

### 3. Check and Adjust Nozzle Area Throat Gaps

NOTE: This check is optional at engine build but is applicable during fault diagnosis following loss of performance on engine test.

#### A. Assemble Nozzle Assembly to Combustion Chamber Outer Case (CCOC) for Throat Gap Checks (Ref.Fig.503).

- (1) Assemble the multiple leg sling (Tool 1192) to the nozzle assembly.
  - (a) Ensure that the nozzle vane retaining hooks on the multiple leg sling are fully retracted and turned outward. Attach a sling (Tool 1645) to the multiple leg sling and position the tools over the nozzle vanes.
  - (b) Carefully lower the equipment and ensure that the support bosses on the tool locate correctly on the diaphragm flange. Position the tool so that the retaining hooks will penetrate between the blades of each nozzle vane.
  - (c) Depress the retaining hooks and turn them to engage with the forward edges of the nozzle vanes blades. Retract the hooks to retain the nozzle vanes and secure the hooks and vanes by tightening the knurled nuts.
- (2) Assemble the nozzle assembly to the CCOC.
  - (a) Place the CCOC on a pallet (Tool 1014). The rear flange of the CCOC must be uppermost.
  - (b) Check to ensure that all nozzle vanes are properly secured with the retaining hooks then carefully lift the assembly clear of the assembly tool.
  - (c) Align the top of the diaphragm with the top of the CCOC. Lower the nozzle assembly into position on the CCOC flange ensuring that the inspection port on the CCOC aligns with the hole in No.13 nozzle vane. Also ensure that

No.11 and No.14 vanes align with the thermo-couple locations in the casing.

- (3) Remove the multiple leg sling from the nozzle assembly.
  - (a) Unscrew the knurled nuts, disengage the hooks from the nozzle vanes and fully retract the hooks. Remove the tool from the nozzle vane assembly.
- (4) Check and ensure that all nozzle vanes are fully engaged with the recess in the CCOC flange and that the nozzle assembly bolt holes are accurately aligned with those in the CCOC flange.
- (5) Measure the gaps between the nozzle vanes with feeler gauges (Tool 1935) which are stored in a container (Tool 1018). Insert shims of even thickness between the nozzle vanes.
- (6) Assemble the clamping ring (Tool 1262) to the CCOC.
  - (a) Position the clamping ring in position on the CCOC flange and nozzle assembly. Secure the clamping ring with nuts evenly tightened.

B. Throat Gap Checks Nozzle Vanes (Ref.Fig.504 and 505).

- (1) Commencing at No.1 vane place the station marking gauge (Tool 1936) on each vane in preparation for marking. The gauge must locate on each vane separately and not span the joint between vanes. Ensure that the spigots on the gauge are in contact with the nozzle vane during marking procedure.
- (2) Lightly mark the vanes along the edge of each slot indicated by an arrow on the marking gauge. The marked positions will be referred to as A, B or C for checking purposes (Ref.Fig.504).
- (3) Set the dial indicator(s) (Tool 1937) in preparation for throat gap checks (Ref.Fig.504).

NOTE: The dial indicators (Tool 1937) listed as alternatives for measuring throat gap areas A, B and C are adjusted to the setting gauge (Tool 1938) and distance pieces (Tools 1939, 1940 and 1941). Dial indicator (T.367769) has insufficient indicator movement to measure stations A, B and C through one

setting, therefore three separately adjusted dial indicators of that type are required. Dial indicator (S3S.15217-000) has sufficient indicator movement to measure stations A, B and C through one setting.

- (a) Ensure thorough cleanliness of the setting gauge (Tool 1938) and distance pieces. Assemble the following distance pieces to the setting gauge and adjust the dial indicator(s) to the required settings.

- Position A distance piece (Tool 1939)
  - Position B distance piece (Tool 1940)
  - Position C distance piece (Tool 1941)

- (b) Throat gap setting dimensions are as follows:

- Position A 0.968 in. (24,587 mm)
  - Position B 1.152 in. (29,261 mm)
  - Position C 1.324 in. (33,630 mm)

- (4) Check and record throat gaps (Ref.Fig.505).

NOTE: In order to measure the throat gap at each position carefully manipulate the dial indicator to achieve a 'rocking' movement during the checking procedure.

- (a) Commencing at No.1 vane place the station guide (Tool 1942) in position on the nozzle vane blade. Using the previously set dial indicator(s) check and record the minimum gaps between the slots in the checking tool and the marked positions A, B, C on the adjacent blade.

- (b) Repeat the throat gaps measuring procedure between each blade until the complete nozzle assembly has been measured. Ensure that an accurate record of each throat gap is recorded in order to identify exact points for correction.

- (5) Set the length gauge (Tool 1943) in preparation for turbine nozzle vanes length checks (Ref.Fig.505).

- (a) Assemble the length gauge to the setting block (Tool 1944) and adjust the dial indicator to 0 setting.

OVERHAUL

- (6) Check and record nozzle vanes lengths (Ref.Fig.505).

NOTE: In order to measure the vane length at each position carefully manipulate the length gauge during the checking procedure.

- (a) Place the length gauge between the vanes of No.1 nozzle vane assembly. Ensure that the gauge is correctly in position then check and record the minimum dial indicator reading.
  - (b) Repeat the measuring procedure at No.2 vane assembly and continue checking until the length of each vane assembly is recorded. Do not measure the joint locations between the vanes.
  - (c) Nozzle vane lengths are between 8.925 in. (226,695 mm) and 8.985 in. (228,219 mm).
- (7) Calculate the mean value of throat gaps A, B, C as follows:

$$\frac{\text{Sum of 144 throat gaps}}{144} = \text{DIMENSION V}$$

- (8) Calculate the mean value of nozzle vane lengths as follows:

$$\frac{\text{Sum of 24 lengths}}{24} = \text{DIMENSION W}$$

- (9) Calculation to obtain total throat area

$$V \times W \times 48 \times 0.958 \text{ in. (24,333 mm)}$$

- (10) Acceptance limit for total throat area.

- (a) On engines to SB.72-44 472 sq in. - 2 sq in. (304515 sq mm - 1290 sq mm).
  - (b) On engines to SB.72-89 464 sq in. - 2 sq in. (299354 sq mm - 1290 sq mm).
- (11) If the throat areas are satisfactory, remove the assembly from the CCOC.
- (a) Assemble the multiple leg sling (Tool 1192) to the nozzle assembly. Ensure that the retaining hooks are correctly engaged with the nozzle vanes.

SUB-ASSEMBLY

**72-52-01**

Page 512

OVERHAUL

- (b) Remove the clamping ring from the assembly, also remove the shims from between the nozzle vanes.
- (c) Transfer the nozzle assembly from the CCOC to the mobile table (Tool 1307) in preparation for despatch to the main engine assembly area. Do not remove the multiple leg sling.

C. Investigate and Rectify Incorrect Total Throat Area.

- (1) Examine the recorded figures A, B, C also the length figures to establish the possible points of error.
- (2) Rectify incorrect throat gaps.
  - (a) Using the setting tool (Tool 1008) carefully open or close the nozzle vane throat gap(s). Check the edge of each blade for straightness. Variation must be within 0.010 in (0,254 mm).
  - (b) On completion of throat gap setting procedure measure and record the resultant gaps and recalculate the total throat gap area (Ref. para.B).
- (3) Despatch the nozzle vanes for heat-treatment.
  - (a) Assemble the multiple leg sling (Tool 1192) to the nozzle assembly. Ensure that the retaining hooks are correctly engaged with the nozzle vanes.
  - (b) Remove the clamping ring from the assembly, also remove the shims from between the nozzle vanes and transfer the nozzle assembly from the CCOC to the mobile table (Tool 1307).
  - (c) Carefully disassemble the nozzle vanes from the diaphragm unit and place them in transport containers (Tool 1371). Identify the diaphragm unit with the engine assembly number and place it in container (Tool 1417).
  - (d) Ensure that the nozzle vanes are clearly identified in the respective containers to avoid interchange with similar components.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (e) Pre-heat an oven to a temperature of 1050 deg C. then place the nozzle vanes in the oven for a period of 10 minutes at the specified temperature. Protective clothing must be worn when handling hot components.
- (4) On completion of heat-treatment recheck the throat gaps.
  - (a) Place the diaphragm assembly in position on the mobile table.
  - (b) Separate and identify the nozzle vanes (Ref. para.2.B.).
  - (c) Assemble the nozzle vanes to the diaphragm (Ref. para.2.C.).
  - (d) Temporarily assemble the nozzle vane assembly to CCOC (Ref. para.3.A.).
  - (e) Check the throat gap areas (Ref. para.3.B.).
- (5) After satisfactory re-check of throat gap despatch the nozzle vanes for crack detection.
  - (a) Assemble the multiple leg sling (Tool 1192) to the nozzle assembly, remove the clamping ring and shims and transfer the assembly to the mobile table.
  - (b) Remove the nozzle vanes from the diaphragm and place them in transport containers (Tool 1371) and despatch for crack detection (Ref. Inspection/Check 72-52-01).
- (6) On return from crack detection reassemble the nozzle vanes to the diaphragm, assemble the multiple leg sling to the nozzle assembly and transfer it to the mobile table. Do not remove the multiple leg sling from the nozzle assembly as the nozzle vanes must be despatched in the assembled state to the engine assembly area.
- (7) If SB.72-44 or 72-89 is embodied, module interchangeability will be affected. Ensure that the module identification plate is correctly marked.
- (8) Secure the module plate to the nozzle assembly, then transfer the nozzles to engine assembly (72-00-00, Assembly).

## LP TURBINE ROTOR - SUB-ASSEMBLY

### 1. General

- A. Prior to commencing assembly, refer to 72-09-01 Assembly for general information.
- B. During the sub-assembly procedure reference will be made to the Illustrated Parts Catalogue (I.P.C.) to identify those items where the nomenclature does not positively identify them due to duplication of the title e.g. nuts, bolts, washers etc. Where the item is part of this text it will be identified as e.g. bolt (1-10), the 1 referring to the I.P.C. Fig.No. and the 10 referring to the Item No.
- C. Throughout the text special tools are quoted by their Ref. No. e.g. (Tool 1234). For a complete list of tooling required for the assembly and for the Manufacturers Part No., refer to Special Tools, Fixtures and Equipment Table 1001.
- D. The LP turbine rotor sub-assembly is composed of 79 turbine blades assembled to a disk to form an inter-locking assembly. Blade roots are slotted into the disk and separately locked with expendable locking tabs. Static unbalance correction is effected by means of turbine blades interchange. The sub-assembly is dynamically balanced in conjunction with a slave mandrel.

CAUTION: TURBINE BLADES (72-52-02/1-230B) SB.72-22  
STANDARD MUST NOT BE MIXED WITH TURBINE BLADES  
(72-52-02/1-230A) PRE SB.72-22 STANDARD.

### 2. Air Flow LP Turbine Blades

#### A. Prepare for Air Flow.

- (1) Assemble air nozzle (Tool 950) to the blow gun.

NOTE: The air nozzle is designed to be used with a Schraeder No.7184 standard blow gun.

#### B. Air Flow Turbine Blades.

- (1) Blow air through each hole in every turbine blade and ensure that air flows freely through each cooling hole.
- (2) Investigate and rectify obstruction of any cooling hole.

SUB-ASSEMBLY  
**72-52-02**

MK.610-14-28

OVERHAUL

- (3) On completion of air flow check place the blades into container (Tool 1426).

3. Mass Moment Weigh Turbine Blades (Schenk Vertical Spindle Machine)

NOTE: Operate the machine in accordance with the manufacturers instructions. Set the machine to operate in a clockwise direction.

A. Prepare Equipment (Ref.Fig.501).

- (1) Assemble the moment weighing adapter (Tool 16) to the drive shaft.
  - (a) Remove the adapter from container (Tool 268). Ensure thorough cleanliness of the adapter and the drive shaft.
  - (b) Rotate the drive shaft to achieve 0 setting on the illuminated indicator situated on the front of the drive shaft cabinet.
  - (c) Place the adapter in position on the drive shaft studs. Ensure that the turbine blade location end of the adapter is positioned on the marked plate on the table section. The setting in (b) must also be maintained during this procedure.
  - (d) Secure the adapter to the drive shaft with six nuts and washers.
- (2) Assemble the adapter arm (Tool 11) to the weighing adapter.
  - (a) Remove the adapter arm from container (Tool 169) and ensure thorough cleanliness of the unit.
  - (b) Place the adapter arm in position on the adapter and secure with the nut and washer.
  - (c) Set the sliding weight on the adapter arm to 0 oz in.

NOTE: The sliding weight is moved by depressing the flat section before setting to the required scale setting.

OVERHAUL

- (3) Assemble the squared graticule (Tool 33) to the vectometer screen location.
  - (a) Hold the existing screen in position whilst lifting the hinged retaining clips and releasing the retaining screw at the top of the screen.
  - (b) Carefully withdraw the screen and place in a suitable protective container.
  - (c) Place the squared graticule in position ensuring that the slot engages with the pin at bottom position.
  - (d) Secure the graticule with the hinged clips and retaining screw.

B. Calibrate Equipment (Ref.Fig.501).

- (1) Operate the weighing machine and adjust to obtain 0 horizontal/vertical setting.
- (2) If the vectometer light spot is horizontally outside of the graticule squares, adjust as follows.
  - (a) Unscrew and remove the tangential adjustment weight locking pin on the mass moment weighing adapter (Tool 16).
  - (b) Rotate the weight in order to adjust to the right or left in accordance with the graduated plate and marks on the side of the weight.
  - (c) On completion of the adjustment, screw the adjustment weight locking pin into position and tighten. Repeat the procedure detailed in para.(1).
- (3) Check sliding weight on the adapter arm.
  - (a) Set the sliding weight to 2 oz in. on the adapter arm.
  - (b) Operate the machine to check the sliding weight setting.
  - (c) Set the sliding weight to each position on the adapter arm and check each setting by operating the machine.

OLYMPUS 593

MK.610-14-28 snecma  
OVERHAUL

- (d) In the event of unsatisfactory calibration results, check the assembly of the tools and security of the sliding weight before investigation of balancing machine malfunction.

C. Mass Moment Weigh Each Blade (Ref.Fig.501).

- (1) Insert the turbine blade into the blade root location in the end of the moment weighing adapter.
- (2) Secure the blade with the retaining plate and bolt on the adapter.
- (3) Place the balance weight (Tool 28) on the weighing adapter and secure with the locknut. Set the sliding weight on the adapter arm to 20 oz in.

NOTE: The 20 oz in. setting is an approximation for the first blade final adjustment of the sliding weight will be made to suit each blade.

- (4) Check the security of the assembly then operate the machine to mass moment weigh.
- (5) Remove each blade from the adapter on completion of weighing.
- (6) Attach a suitable adhesive label to each blade and inscribe with the weight and engine serial number.
- (7) Place the blades into the containers and convey to the appropriate sub-assembly area.

4. Mass Moment Weigh Turbine Blades (Avery Scales TYPE 62N/5)

NOTE: This is an alternative method to that detailed in para.3.

A. Prepare Equipment (Ref.Fig.502).

- (1) Assemble the adapter arm locator (Tool 1274) to the adapter arm (Tool 1272).
- (2) Adjust the setting on the adapter arm to 10.525 in. (254,525 mm).
- (3) Attach the adapter arm to the weighing scale arm and secure firmly.
- (4) Ensure that the scale pans suspension piece is correctly positioned.

OVERHAUL

- (5) Carefully add weights to the upper scale pan to achieve 0 reading on the scale. Fine adjustment can be effected by moving the screwed adjustment weights on the front of the scale.
- (6) Ensure that the screwed adjustment weights are locked together when 0 setting is achieved.
- (7) Check the scale reading progressively by adding weights in 1 oz (28,350 g) increments to the upper scale pan.
- (8) On completion of the checks return to 0 reading on the scale as detailed in (5).

B. Mass Moment Weigh Each Blade (Ref.Fig.502).

CAUTION: EXERCISE CARE DURING ASSEMBLY OF BLADES TO ADAPTER ARM. AVOID EXCESSIVE VIBRATION AS DAMAGE TO SCALE OR DISPLACEMENT OF PANS COULD RESULT.

- (1) Carefully place the blade in position on the adapter arm locator and simultaneously engage the blade root with the setting piece on the adapter arm.
- (2) Adjust the setting piece in order to achieve a parallel setting between the blade and adapter arm. Ensure that the setting piece is secure after adjustment.
- (3) Carefully add weights to the lower scale pan until the scale indicator moves.
- (4) Add the total weight value in the lower scale pan to the scale indicator reading.
- (5) Remove the blade from the adapter arm and attach a suitable adhesive label inscribed with the weight and engine serial number.
- (6) Place the blades into the transport containers and convey the set to the appropriate sub-assembly area on completion of weighing.

5. Assemble LP Turbine Blades to Disk

A. Prepare for Assembly (Ref.Fig.503).

- (1) Place the blades in descending weight order on a suitable flat surface.

SUB-ASSEMBLY

**72-52-02**

Page 507

MK. 610-14-28  
OVERHAUL

- (2) Secure the lifting fixture (Tool 1113) to the end of mandrel (Tool 1132). Ensure that the securing bolt is tightened.
- (3) Prepare the mobile stand (Tool 1111) to accept the mandrel.
  - (a) Check that the clamp support tubes are securely held in the vertical position by the pins located on the angled support tubes.
  - (b) Open the clamps in readiness for the mandrel and lower the mandrel on to the clamps.
- (4) Place the lifting ring (Tool 1121) in position on the studs at the end of the mandrel and secure with four nuts and washers.
- (5) Close and secure the clamp positioned near the lifting ring. Swivel the mandrel to the vertical position so that the serrations in the disk mandrel are uppermost. Remove the nuts from the disk studs.

NOTE: Each clamp is secured vertically or horizontally by a plunger type pin which must be released or engaged by hand.

- (6) Assemble the lifting fixture (Tool 1133) to the LP turbine disk.
  - (a) With the turbine disk on a support (Tool 1012) and serrations on underside carefully lower the lifting fixture into the centre bore of the disk and engage the support feet by turning the knurled nuts to the locked position.
- (7) Attach a crane hoist to the lifting fixture and carefully lower the turbine disk over the vertical mandrel ensuring that the serrations in the turbine disk and the datum mark O align with those of the mandrel.
- (8) Carefully lower the disk over the studs in the mandrel disk and finally secure the assembly with nuts previously removed.
- (9) Remove the lifting fixture from the turbine disk.

- (10) Attach a crane hoist to the lifting fixture on the end of the mandrel. Carefully lower the assembly into the horizontal position on the mobile stand and secure the clamp.
- (11) Remove the bolted lifting fixture (Tool 1113) from the mandrel.
- (12) Attach the crane hoist to the lifting ring on the opposite end of the mandrel and swivel the assembly to the vertical position.

B. Install Turbine Blades (Ref.Fig.504).

- (1) Assemble the mandrel and disk to the turbine disk blading fixture (Tool 1122).
  - (a) Examine the bottom surface of the turbine disk at the blade root locations to identify the light spot marked 'D/L'.
  - (b) Use a suitable non permanent marking substance to transfer the identified location to the top surface of the disk. Ensure that the weight value at position 'D/L' is noted.
  - (c) Release the clamp securing the mandrel and transfer the assembly to the turbine disk blading fixture.
  - (d) Lower the mandrel and disk into the blading fixture. Adjust the blading fixture hand wheel until the top edge of the turbine disk is slightly above the top of the protective rubber on the blading fixture surface.
- (2) Remove the crane hoist.
- (3) Apply lubricant 'A' to the blade roots.
- (4) Select the heaviest blade for assembly to the 'D/L' location in the disk.

NOTE: Do not insert the blade roots fully into the turbine disk in one operation as the last blade will not engage by this method. Enter the blade roots into the turbine disk in small increments.

OVERHAUL

- (5) Insert a locking tab (1-240) into the blade base and carefully enter the blade root and locking tab into the identified 'D/L' location.
- (6) Select a blade of suitable weight to counter balance that assembled to the 'D/L' position. Enter the blade root and a locking tab into the position opposite to the 'Light Spot'.
- (7) Select two blades nearest in weight value to the blade assembled to the 'D/L' location. Assemble a locking tab to each blade and insert each blade into the turbine disk at positions 90 deg each side of the 'D/L' position.
- (8) Repeat the selection of blades in descending weight order. Insert the blades and locking tabs into the disk at opposite positions in order to achieve a balanced assembly.
- (9) When all blades are entered into the disk roots, ensure that the locking tabs engage with the slots in the blade roots and are not dislodged during blade insertion procedure. Use tab retaining disk (Tool 942) to hold the tabs in position.
- (10) Carefully insert each blade in turn until the edge of every blade is in contact with the rubber protector on the blading fixture. Use driver (Tool 907) and a light weight hammer to install the blades. Ensure that the point of contact with the driver is confined to the solid section of the blade root.
- (11) Adjust the hand wheel on the blading fixture to raise the turbine disk assembly slightly, then continue to insert the blades until contact with the rubber protector is made.
- (12) When all of the blades are inserted approximately half-way into the turbine disk carefully remove the assembly from the blading fixture.
- (13) Place the blading base (Tool 1152) concentrically in the blading fixture (Ref.Fig.505). This tool will protect the turbine blade lugs from damage through excessive penetration of the blades in the turbine disk.

- (14) Carefully lower the turbine rotor assembly into the blading fixture until it rests on the blading base. Ensure that the blade roots rest on the stepped sections between the blading base slots.
- (15) Continue to insert each blade in turn by gradual stages and ensure that all blades are fully and evenly assembled to the disk.
- (16) Check the turbine blades for slackness.
  - (a) Carefully check each blade for movement at the shroud interlocking joint. If movement is evident and clearance occurs at the centre section of the interlocking joints measure the gaps to ascertain the amount of clearance.
  - (b) If the clearance exceeds 0.001 in. (0,0254 mm) at any centre section of the interlocking joints the blades are unacceptable for further running and must be rejected.
- (17) Carefully raise the turbine out of the blading fixture. With the assembly in the vertical position secure the mandrel to the clamp in the mobile stand.
- (18) Remove the pin securing the angled support tube to the clamp support tube on the opposite end of the mobile stand. Carefully swivel the clamp tube forward to provide clearance for the turbine blades when lowering the mandrel into the horizontal position.
- (19) Carefully swivel the mandrel until it is almost horizontal in the mobile stand. Position the clamp support tube vertically and secure it to the angled support tube with the pin. Lower the mandrel onto the clamp and secure it.
- (20) If the turbine blades slackness checks are satisfactory convey the assembly to the appropriate area for static balance checks (Ref. para.6).
- (21) If the turbine blades are rejected because of excess slackness invert the turbine assembly, remove it from the mobile stand and transfer it to the blading fixture for de-blading.
  - (a) Remove the blading base from the blading fixture and place the blade platform stand (Tool 954) on top of the blading fixture.

SUB-ASSEMBLY

OVERHAUL

- (b) Assemble the lifting fixture (Tool 1113) to the end of the mandrel. Ensure that the securing bolt is tightened. Secure the mandrel extension (Tool 1135) to the opposite end of the mandrel.
- (c) Attach a crane hoist to the lifting fixture, open the adjacent clamp and raise the mandrel slightly.

CAUTION: TURBINE BLADES MUST NOT CONTACT CLAMP SUPPORT TUBE. DAMAGE TO BLADES COULD RESULT.

- (d) Carefully swivel the clamp support tube forward to provide clearance for the turbine blades.
- (e) Transfer the turbine and mandrel to the blading fixture. Lower the assembly into the blading fixture and adjust the hand wheel so that the underside of the blades are slightly above the blade platform stand.

NOTE: Owing to the interlocking turbine blade shrouds, the blades cannot be removed from the turbine disk singly in one operation.

- (f) Using a driver (Tool 907) and a light weight hammer carefully tap each blade at the solid section of the blade root to effect a gradual and even removal of the blades from the turbine disk. Adjust the hand wheel on the blading fixture to regulate the progressive disassembly of the blades.
- (g) Identify each blade with the reason for rejection following removal from the disk. Place the blades in containers (Tool 1426). On completion of disassembly remove the rejected blades from the sub-assembly area.

(22) Prepare the turbine disk for the assembly of replacement turbine blades.

- (a) Attach a crane hoist to the lifting fixture attached to the end of the mandrel. Carefully transfer the assembly to the mobile stand, secure the mandrel to the clamp on the mobile stand, swivel the assembly to the horizontal position and secure the clamps.

SUB-ASSEMBLY

72-52-02

Page 515

MK.610-14-28  
OVERHAUL

- (b) Remove the extension (Tool 1135) from the mandrel and assemble the lifting ring (Tool 1121) to the mandrel. Remove the lifting fixture from the opposite end of the mandrel.
- (c) Attach a crane hoist to the lifting ring and transfer the assembly to the blading fixture. Remove the blade platform stand (Tool 954) from the top of the blading fixture and carefully lower the assembly into the fixture.

- (23) Install replacement turbine blades (Ref. para. 2, 3, 4, 5).

6. Statically Balance LP Turbine Rotor (Avery Balancing Machine Type 72.N.17)

**WARNING:** ISOLATE BALANCING MACHINE FROM ELECTRICITY SUPPLY BEFORE COMMENCING PREPARATION, INSTALLATION OR TURBINE REMOVAL PROCEDURES.

A. Prepare Balancing Equipment.

- (1) Place the adjustable bearing (Tool 1637) in the bearing support positioned at the greater distance from the balancing machine drive shaft. Secure the adjustable bearing to the bearing support with two clamp plates and bolts (Ref. Fig. 506).
- (2) Set the adjustable bearing to the mandrel diameter (Ref. Fig. 506).
  - (a) Attach a crane hoist to the lifting fixture (Tool 1131) then position the fixture on the mandrel. Release the mobile stand clamps and carefully lift the turbine assembly. Measure the bearing location of the mandrel with adjustable bearing gauge (Tool 1641). Carefully lock the gauge and check that the setting has not been disturbed.
  - (b) Place the gauge on the adjustable bearing housing. Slacken the bolt securing the support arm connected to the bearing roller positioned nearest the adjustment point on the gauge. Carefully move the roller until it is in contact with the adjustment point on the gauge. Tighten the roller support arm securing bolt and check to ensure that the roller remains in contact with the gauge.

OVERHAUL

- (c) Remove the gauge and re-position it for adjustment of the opposite roller. Set and lock the roller in accordance with the previously described procedure. Remove the gauge.
- (3) Assemble the bearing housing and bearing to the balancing machine (Ref.Fig.507).
  - (a) Place the lower half of the bearing housing (Tool 1652) in the bearing location positioned near the drive shaft on the balancing machine. Secure the bearing housing with two clamp plates and bolts.
  - (b) Place the lower half of the slave bearing (Tool 363) into the bearing housing and secure with the retaining bolt in the bearing housing.

NOTE: The lower half of the slave bearing is identified by the oil drain hole at the bottom position.

- (4) Position the lower half of shroud (Tool 1642) between the balancing machine bearing supports in preparation to accept the turbine rotor.

B. Install Turbine Rotor on Balancing Machine.

- (1) Attach the lifting fixture (Tool 1131) and crane hoist to the mandrel and carefully raise the turbine assembly out of the mobile stand.
- (2) Transfer the assembly to the balancing machine.
  - (a) Carefully lower the assembly into position over the balancing machine with the mandrel disk positioned near the balancing machine shaft coupling.
  - (b) Refer to the balancing machine manufacturers instructions for information regarding the adjustment of the bearing supports and adjust the bearing supports to accommodate the installation of the LP turbine assembly. Lock the supports.

OVERHAUL

- (c) Finally lower the turbine assembly into the bearing support. Engage the drive shaft coupling with the mandrel and secure with nuts. Check to ensure that the mandrel is correctly located on the slave bearing and adjustable rollers.
  - (d) Finally position the shroud half to ensure adequate clearance for the turbine rotor, then secure the shroud to the balancing machine.
  - (e) Assemble the upper half of the slave bearing (Tool 363) to the upper half of the bearing housing (Tool 1652), then secure it with the retaining bolt in the bearing housing section. Place the slave bearing and bearing housing upper half over the mandrel and the lower half of the assembly. Secure it with the two securing bolts.
- (3) Remove the lifting fixture from the mandrel.
- (4) Lubricate the slave bearing assembly with lubricant 'A' and ensure that the assembly rotates freely by hand.
- (5) Install the upper half of the shroud (Tool 1642).
- (a) Carefully lower the shroud section into position over the turbine wheel. Secure the shroud sections together with the hinge bolts.
- C. Check the Unbalance of LP Turbine Rotor.
- (1) Operate the balancing machine in accordance with the manufacturers instructions. Maintain lubrication of the bearings. Record the amount of unbalance; also record the angular position of unbalance with reference to the blade position numbers.
- D. Acceptance Limits.
- (1) Provided the unbalance does not exceed 80 drn in. the disk is acceptable. If the unbalance is greater than 80 drn in. carry out blade position change (Ref. para.F.).

SEE TR

E. Numerically Identify Turbine Blades and Lock the Tabs  
(Ref.Fig.508).

- (1) On satisfactory completion of the balance check, disconnect the mandrel from the drive shaft coupling and remove items as necessary to allow removal of the turbine assembly from the balancing machine. Using the lifting fixture (Tool 1131), transfer the turbine assembly to the mobile stand and secure it in the horizontal position.
- (2) Commencing at No.1 position on the turbine disk blade root, lightly vibro-etch each turbine blade root with its position number to correspond with the number on the disk.
- (3) Taking care to avoid striking the blade tang, carefully tap the front face of each blade root with a soft faced hammer or drift, until the tangs of all blades are in contact with the front face of the turbine disk.
- (4) While preventing forward movement of the blades in their slots, use the hammer (Tool 1655) and bend the locking tab of each blade over the edge of the disk as shown.
- (5) Ensure that all blade tangs are contacting the front face of the disk, then check the clearance at the end of each locking tab with feeler gauges. The maximum acceptable clearance at this point is 0.010 in. (0,254 mm).

F. Blade Re-positioning Procedure to Rectify Unbalance.

- (1) Remove the assembly from the balancing machine.
  - (a) Disconnect the mandrel from the drive shaft coupling and remove items as necessary to allow removal of the turbine assembly from the balancing machine. Using the lifting fixture (Tool 1131), transfer the turbine assembly to the mobile stand and secure it in the horizontal position.

OVERHAUL

- (2) Install the turbine assembly in the blading fixture.
- (a) Place the blade platform stand (Tool 954) on top of the blading fixture.
  - (b) Assemble the lifting fixture (Tool 1113) to the end of the mandrel and ensure that the securing bolt is tightened. Assemble the mandrel extension (Tool 1135) to the opposite end of the balancing mandrel.
  - (c) Attach a crane hoist to the lifting fixture bolted to the end of the mandrel, open the adjacent clamp and raise the mandrel slightly.
- CAUTION: TURBINE BLADES MUST NOT CONTACT CLAMP SUPPORT TUBE. DAMAGE TO BLADES COULD RESULT.
- (d) Remove the pin securing the angled support tube to the clamp support tube. Carefully swivel the clamp tube forward to provide clearance for the turbine blades when raising the assembly. Swivel the mandrel to the vertical position, release the clamp and transfer the assembly to the blading fixture.
  - (e) Lower the assembly into the blading fixture and adjust the hand wheel so that the underside of the blades are slightly above the blade platform stand.
- (3) Remove the blades from the turbine disk.

NOTE: Owing to the interlocking turbine blade shrouds, the blades cannot be removed from the turbine disk in one operation.

- (a) Use the driver (Tool 907) and a light weight hammer to remove the blades. Carefully tap each blade at the solid section of the blade root to effect a gradual and even removal of the blades from the turbine disk. Adjust the hand wheel on the blading fixture to regulate the progressive disassembly of the blades.
- (b) On completion of the removal of the blades, place the blades in descending weight order on a suitable flat surface and retain the locking tabs.

SUB-ASSEMBLY

**72-52-02**

Page 523

Nov 1/76

MK.610-14-28  
OVERHAUL

- (4) Remove the turbine disk and mandrel from the blading fixture. Secure the lower end of the mandrel to the mobile stand clamp, then carefully swivel the assembly horizontally into the stand. Ensure that the clamp support tube is correctly secured, then secure the clamp to the mandrel.
- (5) Remove the mandrel extension from the end of the mandrel and assemble the lifting ring (Tool 1121). Remove the lifting fixture from the opposite end of the mandrel.
- (6) Attach a crane hoist to the lifting ring secured to the end of the mandrel, open the adjacent clamp and raise the mandrel slightly.

CAUTION: TURBINE BLADES MUST NOT CONTACT CLAMP SUPPORT TUBE. DAMAGE TO BLADES COULD RESULT.

- (7) Remove the pin securing the angled support tube to the clamp support tube. Carefully swivel the clamp tube forward to provide clearance for the turbine blades when raising the assembly. Swivel the mandrel to the vertical position in the mobile stand.
- (8) Ensure that the datum position is clearly marked on the top surface of the disk. Release the clamp securing the mandrel then transfer the assembly to the turbine disk blading fixture. Remove the blade platform stand from the top of the blading fixture. Lower the assembly into the blading fixture and adjust the hand wheel until the top edge of the turbine disk is slightly above the top of the protective rubber on the blading fixture surface. Remove the crane hoist.
- (9) Reposition the turbine blades in the turbine disk.
  - (a) Apply lubricant 'A' to the blade roots. Select blades of suitable weight to correct the unbalance factor. Assemble a locking tab to each blade and enter it into the disk.
  - (b) When all blades are entered into the disk roots, ensure that the locking tabs engage with the slots in the blade roots and are not dislodged during blade insertion procedure. Use tab retaining disk (Tool 942) to hold the tabs in position.

OVERHAUL

- (c) Carefully insert each blade in turn until the edge of every blade is in contact with the rubber protector on the blading fixture. Use driver (Tool 907 ) and a light weight hammer to install the blades. Ensure that the point of contact with the driver is confined to the solid section of the blade root.
- (d) Adjust the hand wheel on the blading fixture to raise the turbine disk assembly slightly then continue to insert the blades until contact with the rubber protector is made. When all of the blades are inserted approximately half-way into the turbine disk, carefully remove the assembly from the blading fixture.
- (e) Place the blading base (Tool 1152) concentrically in the blading fixture.
- (f) Carefully lower the turbine rotor assembly into the blading fixture until it rests on the blading base. Ensure that the blade roots rest on the stepped sections between the blading base slots. Continue to insert each blade in turn by gradual stages and ensure that all blades are fully and evenly assembled to the disk.
- (g) Carefully remove the turbine assembly from the blading fixture and assemble it in the vertical position to the mobile stand. Secure the clamp and carefully swivel the assembly to the horizontal position. Ensure that the clamp support tube is correctly secured, then secure the clamp to the mandrel.
- (h) Remove the lifting ring from the end of the mandrel. Convey the assembly to the appropriate area for static balance checks. Remove the blading base from the blading fixture.
- G. Re-Check Static Balance of LP Turbine Rotor.
- (1) Prepare the balancing equipment (Ref.para.6.A.).
  - (2) Install the turbine rotor on the balancing machine (Ref.para.6.B.).
  - (3) Check the unbalance of the turbine rotor (Ref.para.6.C.).

- (4) Check the acceptance limits (Ref.para.6.D.).
- (5) Numerically identify the turbine blades and lock the tabs and check end-float (Ref.para.6.E.).

## 7. Assembly of Hub Unit and Labyrinths to LP Turbine Rotor

### A. Assemble Slave Bearing Track to Turbine Hub Unit (Ref.Fig.509).

- (1) Ensure thorough cleanliness of all components.
- (2) Place the hub unit (1-210) into the mechanical driver (Tool 1136) and place the slave bearing track (Tool 850) squarely on the hub. Assemble the detachable section of the assembly fixture over the slave bearing. Screw the handle in position and carefully apply sufficient load to press the slave bearing fully into position on the hub unit. Remove the hub unit from the assembly fixture.

### B. Assemble Air Duct to Hub Unit (Ref.Fig.509).

- (1) Prepare the stand assembly (Tool 873).
  - (a) Ensure that the reduction gearbox is securely attached to the stand, and check that the gear cover is in position on the gearbox. Ensure that the clamp is secured to the reduction gearbox and that the adapter is securely assembled to the clamp.
- (2) Check the operation and safety of the stand assembly.
  - (a) In conjunction with the foot pedal release/brake, rotate the assembly by turning the handle. Check for free rotation, positive locking and release operation. Return the assembly to the vertical position in readiness for the turbine hub installation.
- (3) Assemble the hub unit/slave bearing assembly to the stand adapter.
  - (a) Remove the splined retaining clamp from the adapter and place the hub unit in position on the adapter.

- (b) Install the splined retaining clamp to hold the hub unit in position. Secure the clamp with the retaining nut. Unscrew and remove the puller from the splined clamp.
- (4) Install the flanged cooling air duct (1-200).
  - (a) Shrink the air duct by use of a suitable freezing agent. Ensure that suitable protective gloves are worn when handling the frozen component. Align the bolt holes in the air duct with the holes in the hub unit. Press the air duct fully into the hub unit.
  - (b) Apply lubricant 'C' to securing items. Secure the hub and duct together with bolts (1-190), nuts (1-150) and washers (1-180).
  - (c) Ensure that the nuts have a minimum locking (run-down) torque of 6.5 lbf in. (0,73 N.m). Torque-tighten the nuts to 210 lbf in. (24 N.m). After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 2.5 thread pitches beyond nut chamfer, the bolt must be renewed (Ref.SB.72-8444-225).
- C. Assemble Turbine Rotor to Hub Unit (Ref.Fig.510).
  - (1) Assemble the No.25 labyrinth ring to the No.26 labyrinth housing.
    - (a) Ensure thorough cleanliness of components. Apply lubricant 'C' to securing items. Align the datum mark 0 on the labyrinth and housing. Secure the labyrinths together with nuts (1-20) bolts (1-90) and washers (1-80). Tighten the nuts and bolts sufficiently to hold the labyrinth ring and housing together. The final torque-tightening will be detailed later.

OVERHAUL

- (2) Place the labyrinth assembly in an oven and heat it to 150 deg C.
- (3) Shrink the air duct.
  - (a) Position the support wedge (Tool 3072) in the bottom of the air duct/hub unit assembly. Place the sleeve support (Tool 944) inside the air duct. Pack the sleeve support with a suitable freezing agent.
- (4) Position the turbine rotor on the hub unit.
  - (a) Secure the lifting ring (Tool 1121) to the studs on the end of the mandrel in the mobile stand. Attach a crane hoist to the lifting ring secured to the end of the mandrel, open the adjacent clamp and raise the mandrel slightly.

**CAUTION: TURBINE BLADES MUST NOT CONTACT CLAMP SUPPORT TUBE. DAMAGE TO BLADES COULD RESULT.**
  - (b) Remove the pin securing the angled support tube to the clamp support tube. Carefully swivel the clamp tube forward to provide clearance for the turbine blades when raising the assembly. Swivel the mandrel to the vertical position so that the turbine rotor is horizontally positioned with the serrations on the under surface. Ensure that the mandrel clamp is secure.
  - (c) Attach a crane hoist to the lifting fixture (Tool 998) and position the fixture concentrically on the turbine rotor disk. Raise the fixture sufficiently to establish contact with the bottom surface of the rotor disk. Adjust the steadying blocks on the top of the fixture by slackening the handnuts. Tighten the handnuts before lifting the rotor assembly.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

sneema

- (d) Remove the nuts that secure the mandrel disk to the rotor disk. Carefully raise the turbine rotor assembly away from the mandrel and position the rotor in preparation for assembly to the hub unit.
- (e) Ensure that the serrations on the hub and turbine disk are thoroughly clean and damage free. Align the datum mark 0 on the turbine disk with the datum mark 0 on the hub. Lower the turbine rotor carefully on to the hub. Ensure that the turbine rotor locates correctly on the hub. Remove the lifting fixture from the rotor.
- (5) Assemble the No.25 and No.26 labyrinth to the turbine rotor and air duct.
- (a) Ensure that the datum marks align on the rotor disk and labyrinth assembly. Slide the heated labyrinth assembly over the air duct and ensure that the bolt-holes in the rotor disk align with the holes in the labyrinth. Temporarily secure the labyrinth assembly to the rotor disk with ten bolts (1-120) and nuts (1-10) lubricated with lubricant 'C'.
- (b) Measure the gap between the top edge of the air duct and the edge of the labyrinth. The clearance must be between 0.011 and 0.039 in. (0,279 and 0,990 mm).
- (c) Identify the securing bolt positions 1 to 10 for torque sequence purposes. Commencing at No.1, torque-tighten the nuts to 10 lbf ft (13,6 N.m) in the following sequence 1, 6, 4, 9, 2, 7, 5, 10, 3 and 8. Use the torque wrench (Tool 1658).

- (d) Comply with the numerical torque sequence and increase the torque loading in three stages until between 50 and 55 lbf ft (67,8 and 74,6 N.m) is applied. After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 2.5 thread pitches beyond nut chamfer, the bolt must be renewed (Ref. SB.72-8444-225).
- (e) Remove the sleeve support and support wedges from the air duct unit.
- (6) Tighten the nuts securing the No.25 labyrinth ring to No.26 labyrinth housing. Ensure that the nuts have a minimum locking (run-down) torque of 6.5 lbf in. (0,73 N.m). Torque-tighten the nuts to 210 lbf in. (24 N.m). After torque-tightening, check each bolt for protrusion through its nut. If protrusion is less than 2.5 thread pitches beyond nut chamfer, the bolt must be renewed (Ref. SB. 72-8444-225).

#### 8. LP Turbine Rotor Swash Checks

##### A. Prepare for Checks (Ref.Fig.511).

- (1) Ensure that the balancing mandrel (Tool 1271) is securely clamped and bolted in the mobile stand (Tool 1147) with the lifting adapters (Tool 1143) and (Tool 1144).
- (2) Turn the assembly stand until the turbine rotor is in the vertical position in readiness for assembly to the balancing mandrel.
- (3) Attach a crane hoist to the lifting fixture (Tool 1141) and securely attach the lifting fixture to the disk section of the rotor assembly.

OLYMPUS 593

MK.610-14-28

sneema

OVERHAUL

- (4) Remove the turbine rotor from the adapter.
  - (a) Screw the extractor into the splined clamp located inside the rotor hub. Unscrew and remove the retaining nut securing the splined clamp. Ensure that the crane hoist and lifting fixture supports the turbine rotor. Carefully withdraw the splined clamp.
  - (b) Carefully remove the turbine rotor from the adapter. Secure the splined clamp to the adapter.
- (5) Assemble the turbine rotor to the balancing mandrel.
  - (a) Ensure thorough cleanliness of components especially the splined sections. Align the master spline on the mandrel with the master spline in the turbine hub, carefully slide the turbine rotor assembly on to the mandrel. Use the mechanical driver (Tool 1146) to fully press the turbine on the shaft.
  - (b) Apply lubricant 'A' to the turbine hub threads. Screw the bearing track retaining nut (1-130) on to the hub and tighten it with spanner (Tool 1596).
  - (c) Place the cupwasher (2-20) over the mandrel and ensure that it engages into a castellation on the slave track retaining nut. Screw the turbine retaining nut (2-10) on to the mandrel as far as possible by hand. Ensure that the cupwasher does not become dislodged.
  - (d) Assemble the immobiliser (Tool 1243) to the end of the mandrel. Ensure that it locates fully in position. Place the wrench spanner (Tool 1580) over the immobiliser and engage it with the LP turbine retaining nut. Engage the hand adapter (Tool 1660) with the wrench spanner. Tighten the retaining nut as far as possible by hand, then remove the hand adapter.
  - (e) Attach a crane hoist to the torque multiplier (Tool 1647) and engage the multiplier with the splines on the immobiliser and wrench spanner.

**WARNING:** CRANE HOIST MUST SUPPORT TORQUE MULTIPLIER DURING TORQUE PROCEDURE.

OVERHAUL

- (f) In conjunction with the torque multiplier, use the torque wrench (Tool 1658) and apply a torque load of 1450 lbf ft (1965,9 N.m) to the retaining nut.

NOTE: The torque multiplier has a ratio of 10 to 1 and the input from the torque wrench must therefore be 145 lbf ft (196,6 N.m).

- (g) Remove the equipment. Do not lock the cupwasher.
- (h) Ensure that the slip ring is assembled to the opposite end of the mandrel. Use the spanner (Tool 1567) to check the slip ring knurled retaining nut for tightness.
- (j) Assemble the shroud (Tool 1258) to the mobile stand.

## B. Position Turbine Rotor for Swash Check (Ref.Fig.512).

- (1) Ensure thorough cleanliness of all components.
- (2) Assemble the equipment to the inspection table.
  - (a) Place two mandrel supports (Tool 1073) on the inspection table and temporarily secure them to the table with retaining bolts and plates.
  - (b) Assemble the adjustable bearing (Tool 966) to a support and secure it with retaining plates and bolts.
  - (c) Assemble the adapter (Tool 1074) to the second mandrel support and secure it with bolts and retaining plates.
  - (d) Place the lower half of the bearing adapter (Tool 1650) in the support adapter and secure it with retaining plates and bolts.
- (3) Set the adjustable bearing to the slave bearing diameter.

NOTE: This setting procedure is similar to that described and illustrated previously (Ref.Para.6).

OVERHAUL

- (a) Use the adjustable setting gauge (Tool 32) to measure the outside diameter of the slave bearing inner track assembled to the turbine hub. Carefully lock the setting gauge and check that the setting has not been disturbed.
  - (b) Place the setting gauge on the adjustable bearing housing. Slacken the bolt securing the bearing roller positioned nearest the adjustment point on the setting gauge.
  - (c) Carefully move the roller until it is in contact with the adjustment point on the setting gauge. Tighten the roller securing bolt and check to ensure that the roller remains in contact with the setting gauge.
  - (d) Remove the setting gauge and re-position for adjustment of the opposite roller. Set and lock the roller in accordance with the previously described procedure. Remove the setting gauge.
- (4) Position the turbine rotor and mandrel on the supports.
- (a) Assemble the lifting beam (Tool 1145) to the lifting adapters on the balancing mandrel ensuring that the adjustable lifting bracket is positioned near the turbine rotor.
  - (b) Assemble the adjustable bracket to the holes provided for lifting the turbine and mandrel assembly.
  - (c) Remove the top section of the turbine shroud.
  - (d) Remove the bolts securing the adapters to the mobile stand. Carefully raise the mandrel and rotor and position it in readiness to be lowered on to the supports.
  - (e) Position the supports so that the slave bearing inner track on the turbine rotor hub will locate on the adjustable bearing, and the mandrel bearing assembly will locate in the bearing adapter.

NOTE: Ensure that enough space for inspection equipment is available in front of the turbine rotor.

OVERHAUL

- (f) Tighten the bolts securing the supports to the table. Carefully lower the mandrel into position. Remove the lifting beam and carefully check the rotor and mandrel assembly for free rotation.

C. Swash Check Procedure (Ref.Fig.512).

- (1) Commencing at No.1 blade position mark the rotor disk at 45 degree intervals in the clockwise direction. Use an approved non permanent marking substance.
- (2) Position the No.1 blade (0 station) horizontally and prepare the inspection equipment to commence the check. The point of measurement is at the blade root location near the outer rim of the rotor disk.
  - (a) Position two dial indicator gauges 180 deg apart on the horizontal centre line of the turbine disk.
  - (b) Check and record the maximum variation (Total dial indicator reading) measured by each dial indicator gauge, also note the angle of occurrence. The final maximum swash is obtained by calculating the average variation of these readings.
- (3) Acceptance limits.
  - (a) The maximum permissible swash measured by total dial indicator reading must be within 0.005 in. (0,1270 mm).
- (4) On completion of a satisfactory swash check procedure, assemble the lifting beam (Tool 1145) to the lifting adapters on the balancing mandrel. Carefully raise the assembly clear of the supports on the inspection table.
- (5) Lower the assembly on to the mobile stand and secure the lifting adapters with bolts.

- (6) Assemble the shroud to protect the turbine rotor blades. The lifting beam can remain attached to the mandrel pending transfer to the dynamic balancing machine.

## 9. Dynamically Balance LP Turbine Rotor

WARNING: ISOLATE BALANCING MACHINE FROM ELECTRICITY SUPPLY BEFORE COMMENCING PREPARATION, INSTALLATION OR TURBINE REMOVAL PROCEDURES.

### A. Prepare Equipment (Ref.Fig.513).

- (1) Refer to the balancing machine manufacturers information for details of machine operation calibration and adjustment (Avery 72N 55).
- (2) Disengage the drive shaft located at the top position.
- (3) Assemble the adjustable bearing (Tool 966) to the pedestal support on which the turbine slave bearing will rest. Secure the bearing with retaining plates and bolts.
- (4) Assemble the adapter (Tool 1074) and hinged filler bush (Tool 1638) to the second support and secure it with bolts and retaining plates.
- (5) Place the lower section of the bearing adapter (Tool 1650) in the hinged filler bush.
- (6) Adjust the balancing machine pedestal supports to accommodate the turbine/shaft assembly correctly.
- (7) Ensure that the driving belt guard (Tool 1988) is correctly assembled and securely bolted to the balancing machine.

- (8) Set the adjustable bearing to the slave bearing diameter.

NOTE: This setting procedure is similar to that described and illustrated previously (Ref.Para.6).

- (a) Use the adjustable setting gauge (Tool 32) to measure the outside diameter of the slave bearing inner track assembled to the turbine hub.
  - (b) Carefully lock the setting gauge and check that the setting has not been disturbed.
  - (c) Place the setting gauge on the adjustable bearing housing.
  - (d) Slacken the bolt securing the bearing roller positioned nearest the adjustment point on the setting gauge.
  - (e) Carefully move the roller until it is in contact with the adjustment point on the setting gauge.
  - (f) Tighten the roller securing bolt and check to ensure that the roller remains in contact with the setting gauge.
  - (g) Remove the setting gauge and re-position for adjustment of the opposite roller.
  - (h) Set and lock the roller in accordance with the previously described procedure.
  - (j) Remove the setting gauge.
- (9) Install the turbine blade protection shroud (Tool 1303).
- (a) Assemble the shroud support brackets (Tool 1291) to the lower section of the shroud and secure each bracket with nuts, bolts and washers.

TN11169

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (b) Position the shroud on the balancing machine between the belt drive and adjustable bearing support. Loosely retain the shroud brackets with the retaining bolts, nuts and washers. The retaining bolts locate in the channel section of the balancing machine base plate.
- (10) Assemble the restraining bars to the pedestal supports.
- (a) Secure the support brackets (Tool 109) to the pedestal supports with bolts evenly tightened. Assemble the restraining bars to the support brackets. Do not tighten at this stage.
- (11) Install the turbine and balancing mandrel in the balancing machine.
- (a) Apply lubricant 'A' to the turbine mandrel bearing surfaces on the balancing machine. Maintain lubrication throughout the balancing procedure.
- (b) Ensure that the lifting beam is securely attached to the mandrel adapters. Attach a crane hoist to the lifting beam, remove the bolts securing the adapters to the mobile stand, then remove the upper section of the blade protection shroud. Carefully transfer the turbine assembly to the balancing machine.
- (c) Align the slave bearing with the adjustable roller and the opposite end accordingly. Place the driving belt over the mandrel and lower the turbine assembly into position. Adjust the shroud section to allow sufficient clearance around the blades.
- (d) Remove the lifting beam and adapters. Carefully rotate the assembly by hand and ensure freedom of movement.
- (e) Secure the shroud support brackets to the balancing machine base. Assemble the top section of the shroud to the lower section.

SUB-ASSEMBLY

72-52-02

Page 541

MK.610-14-28  
OVERHAUL

SEE TR

- (f) Place the upper section of the bearing adapter (Tool 1650) over the mandrel bearing. Close the hinged filler bush and secure the bolt with the integral wrench.
- (g) Re-check rotation of the assembly by hand. Connect the driving belt to the mandrel and the machine. The tension of the belt is adjusted by operating the air valve positioned on the base of the machine. Finally tighten the bolts securing the driving belt guard. Secure the restraining bars to the support brackets.

B. Check Dynamic Unbalance of Turbine Rotor (Ref.Fig.514).

- (1) Set the balancing machine to rotate the turbine assembly at a speed of 600 revolutions per minute.
- (2) Mechanically rotate the turbine assembly for five minutes continuously and thereafter for three minute periods until two consecutive readings of amount and angle are the same. This check is essential in order to minimise thermal effects caused by the turbine rotor assembly standing static prior to the unbalance check.

NOTE: In the following procedure the correction applied at position FM and at the rear of the mandrel is the correction for mandrel unbalance. The correction applied at FS and at RT is a measure of the turbine assembly initial unbalance. All angles are to be taken from the datum mark on the turbine assembly viewed in a clockwise direction from the rear.

- (3) Using plasticine balance out position FS and RT to within 1 drn in.
- (4) Turn the turbine assembly and slip ring 180 deg in relation to the mandrel.
  - (a) Switch off the electricity supply and isolate the balancing machine.

## CONCORDE

### OLYMPUS 593 OVERHAUL MANUAL

Temporary Revision No. 72-540  
Insert in 72-52-02 after page 542

#### REASON

1. To give a revised procedure for balancing the L.P. turbine rotor that simplifies the corrections for mandrel unbalance.
2. To correct an error defining plane FS in Fig. 514.

#### ACTION

1. Replace existing Para.9.B. to read as follows:-

B. Check dynamic unbalance of turbine rotor (Ref. Fig. 514).

- (1) Set the balancing machine to rotate the turbine assembly at a speed of 600 revolutions per minute. (Minimum)
- (2) Rotate the turbine assembly and monitor in one minute periods until two consecutive readings of amount and angle are the same. This check is essential in order to minimise thermal effects caused by the turbine rotor assembly standing static prior to the unbalance check.
- (3) Plane separate and calibrate through planes FS and RT (Fig. 514).
- (4) With machine selection to 'Balance' record the unbalance by a chinagraph pencil on the machine's polar diagram display for both the FS plane and the RT plane, i.e. FS1 and RT1.
- (5) Turn the turbine assembly 180° in relation to the mandrel.  
NOTE: The slip ring, although removable, is not to be disturbed and is to be regarded as part of the mandrel.

(a) Assemble the lifting adapters (Tool 1143) and (Tool 1144) to the mandrel and assemble the lifting beam (Tool 1145) to the adapters.

(b) Remove the top section of the blade protection shroud, slacken the driving belt and release the bearing clamps. Attach a crane hoist to the lifting beam, transfer the turbine/mandrel to the mobile stand and secure the adapters to the stand with bolts. Remove the lifting beam.

# British airways

## CONCORDE

TR.NO. 72-540 (cont'd)

- (c) Assemble the immobilizer (Tool 1243) to the turbine end of the mandrel. Ensure that it locates fully in position.
- (d) Place the wrench spanner (Tool 1580) over the immobilizer and engage it with the L.P. turbine retaining nut.
- (e) Attach a crane hoist to the torque multiplier (Tool 1647) and engage the multiplier with the splines on the immobilizer and wrench spanner.

WARNING: CRANE HOIST MUST SUPPORT TORQUE MULTIPLIER DURING DE-TORQUEING PROCEDURE.

- (f) In conjunction with the torque multiplier, use the torque wrench (Tool 1658) to slacken the retaining nut. Do not remove the retaining nut at this stage. Remove the equipment.
- (g) Attach a crane hoist to the lifting fixture (Tool 1141) and securely attach the lifting fixture to the disc section of the turbine rotor assembly.
- (h) Remove the turbine retaining nut and cupwasher. Carefully screw the lifting/extractor tool (Tool 1142) onto the turbine shaft. Withdraw the turbine from the shaft by turning the tool handle.
- (j) Slacken the lifting adapters on the mandrel in preparation for the mandrel to be turned 180°.
- (k) Note the position of the mandrel in the mobile stand and turn the mandrel 180° exactly. Tighten the lifting adapters.
- (l) Ensure thorough cleanliness of components especially the splined sections. Carefully slide the turbine rotor assembly on to the mandrel and press it fully in position using mechanical driver (Tool 1146).
- (m) Apply lubricant 'B' to threads. Place the cupwasher over the mandrel and ensure that it engages into a castellation on the slave bearing track retaining nut. Screw the turbine retaining nut on to the mandrel as far as possible by hand. Ensure that the cupwasher does not become dislodged.

# British airways

CONCORDE

TR.NO. 72-540 (cont'd)

(n) Assemble the immobilizer (Tool 1243) to the end of the mandrel. Place the wrench spanner (Tool 1580) over the immobilizer and tighten the retaining nut by hand using hand adapter (Tool 1660).

(p) Attach a crane hoist to the torque multiplier (Tool 1647) and engage the multiplier with the splines on the immobilizer and wrench spanner.

WARNING: CRANE HOIST MUST SUPPORT TORQUE MULTIPLIER DURING TORQUE PROCEDURE.

(q) In conjunction with the torque multiplier use the torque wrench (Tool 1658) and apply a torque load of 1000 lbf ft (1358,8 N.m) to the retaining nut.

NOTE: The torque multiplier has a ratio of 10 to 1 the input from the torque wrench must therefore be 100 lbf ft (135,6 N.m).

(r) Remove the torque equipment. Do not lock the cupwasher.

(6) Install the turbine and mandrel in the balancing machine (Ref: para. 9.A. (11)).

(7) Rotate the turbine to minimise thermal effects (Ref: Para.(2)).

(8) With machine selected to 'balance' record the unbalance in planes FS and RT as in Para.4, i.e. FS2 and RT2.

(9) On the polar displays for both FS and RT, join by a straight line FS1 to FS2 and RT1 to RT2. Bisect those lines and join the bisection points to the polar origins. Complete parallelograms for display FS and RT. The bisection points to origins represent the mandrel out of balance error, whilst the line FS2 to bisection point when transferred to origin represents the initial unbalance for FS and similarly RT2 transferred to origin represents initial unbalance for RT. (See diagram over.).

1 May 1981

TR.72-540

72-52-02

TR.Page 3 of 10

# British airways

## CONCORDE

TR.NO. 72-540 (cont'd)

- (10) If the initial turbine unbalance is greater than 0.9 oz ins. in plane FS or 18 oz ins. in plane RT, check the assembly for installation errors. If an error is located and rectified, repeat Operations (1) to (10). If initial unbalance is acceptable proceed to final balance as in Para. (16).
- (11) If the initial unbalance is outside of the acceptance limits, reposition the turbine hub 180° from the present position on the turbine disc.
  - (a) Assemble the lifting adapters (Tool 1143) and (Tool 1144) to the mandrel and assemble the lifting beam (Tool 1145) to the adapters.
  - (b) Remove the top section of the blade protection shroud, release the driving belt and bearing clamps. Attach a crane hoist to the lifting beam, transfer the turbine/mandrel to the mobile stand and secure the adapters to the stand with bolts. Remove the lifting beam.

# British airways

CONCORDE

TR.NO. 72-540 (cont'd)

- (c) Assemble the immobilizer (Tool 1243) to the turbine end of the mandrel. Ensure that it locates fully in position.
- (d) Place the wrench spanner (Tool 1580) over the immobilizer and engage it with the LP turbine retaining nut.
- (e) Attach a crane hoist to the torque multiplier (Tool 1647) and engage the multiplier with the splines on the mobilizer and wrench spanner.

WARNING: CRANE HOIST MUST SUPPORT TORQUE MULTIPLIER DURING DE-TORQUEING PROCEDURE.

- (f) In conjunction with the torque multiplier, use the torque wrench (Tool 1658) to slacken the retaining nut. Do not remove the retaining nut at this stage. Remove the equipment.
- (g) Attach a crane hoist to the lifting fixture (Tool 1141) and securely attach the lifting fixture to the disc section of the turbine rotor assembly.
- (h) Remove the turbine retaining nut and cupwasher and carefully withdraw the turbine rotor from the mandrel.
- (j) Remove the splined retaining clamp from the adapter on assembly stand (Tool 873) and turn the adapter to the horizontal position to accept the turbine assembly.
- (k) Carefully slide the turbine rotor hub first on to the adapter and install the splined clamp to hold the turbine in position. Secure the clamp with the retaining nut. Remove the puller from the splined clamp.
- (l) Remove the lifting fixture from the turbine disc. Adjust the adapter to position the turbine rotor at top position horizontally. Slacken the locknuts on the main bolts securing the turbine and hub assembly.

WARNING: DO NOT REMOVE NUTS UNLESS ABSOLUTELY NECESSARY. TURBINE WILL BE UNSECURED WHEN NUTS ARE REMOVED.

- (m) Using mechanical puller (Tool 1015) remove No. 25 and 26 labyrinth assembly (Ref: Fig. 515).

1 May 1981

TR.72-540  
72-52-02  
TR. Page 5 of 10

# British airways

CONCORDE

TR.NO. 72-540 (cont'd)

- (i) Unscrew the locking screws and withdraw the locating pins. Finger tighten the locking screws. Position the puller on the labyrinth and align the locating pins with the extraction holes in the labyrinth housing.
- (ii) Release the locking screws and insert the locating pins into the holes in the labyrinth housing. Tighten the locking screws.
- (iii) Commence removal of the labyrinth, remove the turbine securing nuts but ensure that the nuts are loosely reassembled to secure the turbine rotor immediately after removal of the labyrinth.
- (iv) Remove the labyrinth and disassemble it from the mechanical puller.
- (v) Slacken the nuts securing No. 25 and 26 labyrinth assembly.

NOTE: These nuts will be finally tightened after the turbine nuts and bolts have been torque-tightened.

- (n) Assemble the lifting fixture (Tool 998) to the turbine rotor (Ref: Fig. 510).
  - (i) Attach a crane hoist to the lifting fixture and position the fixture concentrically on the turbine rotor disc.
  - (ii) Raise the fixture sufficiently to establish contact with the bottom surface of the rotor disc. Adjust the steadying blocks on the top of the fixture by slackening the headnuts. Tighten the handnuts before lifting the rotor assembly.
  - (iii) Remove the turbine securing nuts and carefully raise the turbine rotor from the hub. Turn the rotor through 180° and lower it on to the hub. Temporarily secure the rotor with the nuts and bolts. Remove the lifting fixture.
- (p) Assemble No. 25 and 26 labyrinth assembly to the turbine rotor and air duct (Ref: Fig. 510).

# British airways

## CONCORDE

TR.NO. 72-540 (cont'd)

- (i) Place the labyrinth assembly in an oven and heat it to 150°C.
- (ii) Position the support wedge (Tool 3072) in the bottom of the air duct/hub unit assembly. Place the sleeve support (Tool 944) inside the air duct and pack the sleeve support with a freezing agent.
- (iii) Remove the nuts and bolts securing the turbine rotor. Ensure that the datum marks align on the rotor disc and labyrinth assembly. Slide the heated labyrinth assembly over the air duct and ensure that the bolt-holes in the rotor disc align with the holes in the labyrinth.
- (iv) Temporarily secure the labyrinth assembly to the turbine rotor disc with the nuts and bolts lubricated with lubricant 'B'.
- (v) Measure the gap between the top edge of the air duct and the edge of the labyrinth. The clearance must be between 0.011 and 0.039" (0,279 and 0,990 mm).
- (vi) Identify the securing bolt positions 1 to 10 for torque sequence purposes. Commencing at No. 1, torque-tighten the nuts to 10 lbf ft (13,6 N.m) in the following sequence 1, 6, 4, 9, 2, 7, 5, 10, 3 and 8. Use the torque wrench (Tool 1658).
- (vii) Comply with the numerical torque sequence and increase the torque loading in three stages until between 50 and 55 lbf ft (67,8 and 74,6 N.m) is applied.
- (viii) Remove the sleeve support and support wedges from the air duct unit.
- (ix) Apply lubricant 'B' to the nuts securing No. 25 and 26 labyrinth assembly. Ensure that the nuts have a minimum locking (rundown) torque of 6.5 lbf in. (0,73 N.m). Torque-tighten the nuts between 135 and 145 lbf in. (15,3 and 16,4 N.m).
- (q) Check the turbine rotor for swash.

1 May 1981

TR.72-540  
72-52-02

TR. Page 7 of 10

# British airways

## CONCORDE

TR.NO. 72-540 (cont'd)

(r) Recheck initial dynamic unbalance. If the unbalance check is satisfactory, carefully vibro-etch a datum mark on the hub in line with that on the turbine rotor and labyrinth assembly. Render the original datum mark on the hub illegible.

(12) If the initial unbalance remains outside of the acceptance limits after turning the turbine 180° relative to the hub, it will be necessary to recheck the static unbalance of the turbine rotor assembly.

(a) Transfer the turbine rotor assembly from the balancing machine to the adapter on the assembly stand (Tool 873) and remove No. 25 and 26 labyrinth assembly (Ref: Para. B. (5) (a) to (n)).

(b) Transfer the turbine rotor to the mandrel (Tool 1132) and mobile stand (Tool 1111) in preparation for static unbalance check.

(i) Ensure that the mandrel is correctly secured to the mobile stand. Secure the lifting ring (Tool 1121) to the end of the mandrel and swivel the mandrel to the vertical position. Ensure thorough cleanliness of the Hirth serrations. Remove the nuts from the mandrel disc.

(ii) Assemble the lifting fixture (Tool 998) to the turbine disc, attach a crane hoist to the lifting fixture and remove the rotor assembly from the hub.

NOTE: The hub assembly can remain in the adapter.

(iii) Align the datum marks O on the turbine disc and mandrel and carefully lower the turbine on to the mandrel. Secure the turbine rotor with the mandrel nuts.

(iv) Attach a crane hoist to the lifting fixture assembled to the end of the mandrel.

(v) Remove the pin securing the angled clamp support tube on the mobile stand and carefully swivel the support tube forward.

CAUTION: TURBINE BLADES MUST NOT CONTACT CLAMP TUBE.  
DAMAGE TO BLADES COULD RESULT.

(vi) Swivel the mandrel into the horizontal position on the stand and secure the clamps and angled support tube. Remove the lifting ring from the end of the mandrel and convey the assembly to the appropriate area for static unbalance checks.

# British airways

## CONCORDE

TR.NO. 72-540 (cont'd)

(c) Recheck static unbalance of the L.P. turbine rotor (Ref. Para.6).

(13) Assemble the turbine rotor to the hub assembly (Ref: Para.7.C.).

NOTE: If the hub assembly has been removed from the adapter, reassemble it to the adapter and secure with the splined clamp and retaining nut (Ref: Fig.509). No. 25 labyrinth ring and No. 26 labyrinth housing have not been disassembled.

(14) Check the turbine rotor for swash.

(15) On completion of satisfactory swash check, transfer the turbine rotor assembly to the dynamic balancing machine and repeat the dynamic balancing procedure. If the initial unbalance is now satisfactory, correct as in (16) etc.

(16) With the machine switched to 'set', nullify the mandrel unbalance error by adjustment of the 'V' and 'H' controls, i.e. bring the unbalance 'spot' indication from FS2 and RT2 along the parallel-ograms to remove the mandrel error indication only. The FS and RT planes will interact and the 'V' controls for both polar displays should be adjusted simultaneously and similarly the 'H' controls.

(17) Correct the unbalance in FS first by fitting 20 times the indicated unbalance to FT from the range (1-30 to 65). Apply lubricant 'B' to the both threads. Do not assemble flat washers to the weight position. Ensure that the securing nuts have a minimum run down torque of 6.3 lbf ins. and torque tighten to 135 - 145 lbf ins.

(18) Correct the unbalance in RT by using weights from the range (1-160 to 169). Use procedures as in 17 above except that correction is one for one.

The planes interact and it may be necessary to adjust the size or position of weights to achieve the allowed unbalance of

FS	0.1 oz inch.
RT	0.3 oz inches.

(19) When satisfactory switch to 'balance' and check that indicated unbalance corresponds to the mandrel unbalance as found graphically in Para. 9.B.9.

(20) If the mandrel unbalance exceeds 0.3 oz inches in FS and 0.7 oz inches in RT make a permanent correction reducing the unbalance to about half.

- (b) Assemble the lifting adapters (Tool 1143) and (Tool 1144) to the mandrel and assemble the lifting beam (Tool 1145) to the adapters.
- (c) Remove the top section of the blade protection shroud, slacken the driving belt and release the bearing clamps. Attach a crane hoist to the lifting beam, transfer the turbine/mandrel to the mobile stand and secure the adapters to the stand with bolts. Remove the lifting beam.
- (d) Using the spanner (Tool 1567) unscrew and remove the slip ring knurled nut. Carefully remove the slip ring and assemble it to the mandrel 180 deg from its original position. Tighten the slip ring.
- (e) Assemble the immobilizer (Tool 1243) to the turbine end of the mandrel. Ensure that it locates fully in position.
- (f) Place the wrench spanner (Tool 1580) over the immobilizer and engage it with the LP turbine retaining nut.
- (g) Attach a crane hoist to the torque multiplier (Tool 1647) and engage the multiplier with the splines on the immobilizer and wrench spanner.

WARNING: CRANE HOIST MUST SUPPORT TORQUE MULTIPLIER DURING DE-TORQUEING PROCEDURE.

- (h) In conjunction with the torque multiplier, use the torque wrench (Tool 1658) to slacken the retaining nut. Do not remove the retaining nut at this stage. Remove the equipment.
- (j) Attach a crane hoist to the lifting fixture (Tool 1141) and securely attach the lifting fixture to the disk section of the turbine rotor assembly.
- (k) Remove the turbine retaining nut and cupwasher. Carefully screw the lifting/extractor tool (Tool 1142) onto the turbine shaft. Withdraw the turbine from the shaft by turning the tool handle.

OVERHAUL

sneema

- (t) Remove the torque equipment. Do not lock the cupwasher.
- (5) Install the turbine and mandrel in the balancing machine (Ref. para. 9.A.(11)).
- (6) Mechanically rotate the turbine to minimise thermal effects (Ref. para. (2)).
- (7) Measure the assembly unbalance at position FS and RT. Acceptance limits are as follows:
  - (a) Unbalance at FS must not exceed 4 drn in.
  - (b) Unbalance at RT must not exceed 10 drn in.
  - (c) If the unbalance is within limits, proceed with para.(8).
  - (d) If the unbalance is in excess of limits at FS correct this by applying to the slip ring (FS) at the known angle of error, a quantity of plasticine which equals one half of the recorded unbalance at FS. Apply the remaining half to the front of the mandrel (FM) also at the known angle of error.
  - (e) If the unbalance is in excess of limits at RT correct this by applying to the rear of the turbine (RT) at the known angle of error, a quantity of plasticine which equals one half of the recorded unbalance at RT. To the mandrel rear RT at the known angle of error, apply a quantity of plasticine which will be equal to the value of one half of the recorded unbalance at RT. The radial difference between RT and adjacent point on the mandrel must be considered.

SUB-ASSEMBLY

72-52-02

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (f) Turn the turbine assembly and slip ring 180 deg to the original position on the mandrel (Ref. para. (11)).
- (g) Measure the unbalance of the assembly at position FS and RT. Acceptance limits are as follows:
- (i) Unbalance at FS must not exceed 4 drin in.
  - (ii) Unbalance at RT must not exceed 10 drin in.
- (8) Having achieved the unbalance limits at FS and RT, the correction required to compensate for that unbalance is as follows:
- (a) Remove all plasticine applied to the slip ring and measure the unbalance at FS.
  - (b) Apply to FT at the same angle of error as FS a quantity of plasticine calculated as follows:  
$$20 \times \text{unbalance at FS}$$
  - (c) Remove all plasticine from RT.
  - (d) Adjust the plasticine at position FT and RT to achieve the following acceptance limits:  
$$\begin{aligned} \text{FS} &= 1 \text{ drin in. (maximum)} \\ \text{RT} &= 4 \text{ drin in. (maximum)} \end{aligned}$$

This represents the initial unbalance at FT and RT.
  - (e) If the initial unbalance is within limits proceed with para. (15).
- (9) If the total correction to be applied to FT or RT exceeds 300 drin in. check the turbine/mandrel assembly for installation error. Repeat the initial unbalance check if the error is located and rectified.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (10) If the initial unbalance remains outside of the acceptance limits, reposition the turbine hub 180 deg from the present position on the turbine disk.
- (a) Switch off the electricity supply and isolate the balancing machine.
  - (b) Assemble the lifting adapters (Tool 1143) and (Tool 1144) to the mandrel and assemble the lifting beam (Tool 1145) to the adapters.
  - (c) Remove the top section of the blade protection shroud, release the driving belt and bearing clamps. Attach a crane hoist to the lifting beam, transfer the turbine/mandrel to the mobile stand and secure the adapters to the stand with bolts. Remove the lifting beam.
  - (d) Assemble the immobilizer (Tool 1243) to the turbine end of the mandrel. Ensure that it locates fully in position.
  - (e) Place the wrench spanner (Tool 1580) over the immobilizer and engage it with the LP turbine retaining nut.
  - (f) Attach a crane hoist to the torque multiplier (Tool 1647) and engage the multiplier with the splines on the immobilizer and wrench spanner.
- WARNING:** CRANE HOIST MUST SUPPORT TORQUE MULTIPLIER DURING DE-TORQUEING PROCEDURE.
- (g) In conjunction with the torque multiplier, use the torque wrench (Tool 1658) to slacken the retaining nut. Do not remove the retaining nut at this stage. Remove the equipment.

**72-52-02**

Page 548

Jul 1/76

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (h) Attach a crane hoist to the lifting fixture (Tool 1141) and securely attach the lifting fixture to the disk section of the turbine rotor assembly.
- (j) Remove the turbine retaining nut and cupwasher and carefully withdraw the turbine rotor from the mandrel.
- (k) Remove the splined retaining clamp from the adapter on assembly stand (Tool 873) and turn the adapter to the horizontal position to accept the turbine assembly.
- (l) Carefully slide the turbine rotor hub first on to the adapter and install the splined clamp to hold the turbine in position. Secure the clamp with the retaining nut. Remove the puller from the splined clamp.
- (m) Remove the lifting fixture from the turbine disk. Adjust the adapter to position the turbine rotor at top position horizontally. Slacken the locknuts on the main bolts securing the turbine and hub assembly.

WARNING: DO NOT REMOVE NUTS UNLESS ABSOLUTELY NECESSARY TURBINE WILL BE UNSECURED WHEN NUTS ARE REMOVED.

- (n) Using mechanical puller (Tool 1015) remove No.25 and 26 labyrinth assembly (Ref.Fig.515).
  - (i) Unscrew the locking screws and withdraw the locating pins. Finger tighten the locking screws. Position the puller on the labyrinth and align the locating pins with the extraction holes in the labyrinth housing.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (ii) Release the locking screws and insert the locating pins into the holes in the labyrinth housing. Tighten the locking screws.
- (iii) Commence removal of the labyrinth, remove the turbine securing nuts but ensure that the nuts are loosely reassembled to secure the turbine rotor immediately after removal of the labyrinth.
- (iv) Remove the labyrinth and disassemble it from the mechanical puller.
- (v) Slacken the nuts securing No.25 and 26 labyrinth assembly.

NOTE: These nuts will be finally tightened after the turbine nuts and bolts have been torque-tightened.

- (p) Assemble the lifting fixture (Tool 998) to the turbine rotor (Ref.Fig.510).
  - (i) Attach a crane hoist to the lifting fixture and position the fixture concentrically on the turbine rotor disk.
  - (ii) Raise the fixture sufficiently to establish contact with the bottom surface of the rotor disk. Adjust the steadying blocks on the top of the fixture by slackening the handnuts. Tighten the handnuts before lifting the rotor assembly.
  - (iii) Remove the turbine securing nuts and carefully raise the turbine rotor from the hub. Turn the rotor through 180 deg and lower it on to the hub. Temporarily secure the rotor with the nuts and bolts. Remove the lifting fixture.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (q) Assemble No.25 and 26 labyrinth assembly to the turbine rotor and air duct (Ref.Fig.510).
- (i) Place the labyrinth assembly in an oven and heat it to 150 deg C.
  - (ii) Position the support wedge (Tool 3072) in the bottom of the air duct/hub unit assembly. Place the sleeve support (Tool 944) inside the air duct and pack the sleeve support with a freezing agent.
  - (iii) Remove the nuts and bolts securing the turbine rotor. Ensure that the datum marks align on the rotor disk and labyrinth assembly. Slide the heated labyrinth assembly over the air duct and ensure that the bolt-holes in the rotor disk align with the holes in the labyrinth.
  - (iv) Temporarily secure the labyrinth assembly to the turbine rotor disk with the nuts and bolts lubricated with lubricant 'A'.
  - (v) Measure the gap between the top edge of the air duct and the edge of the labyrinth. The clearance must be between 0.011 and 0.039 in. (0,279 and 0,990 mm).
  - (vi) Identify the securing bolt positions 1 to 10 for torque sequence purposes. Commencing at No.1, torque-tighten the nuts to 10 lbf ft (13,6 N.m) in the following sequence 1, 6, 4, 9, 2, 7, 5, 10, 3 and 8. Use the torque wrench (Tool 1658).
  - (vii) Comply with the numerical torque sequence and increase the torque loading in three stages until between 50 and 55 lbf ft (67,8 and 74,6 N.m) is applied.
  - (viii) Remove the sleeve support and support wedges from the air duct unit.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

SNECMA

- (ix) Apply lubricant 'C' to the nuts securing No.25 and 26 labyrinth assembly. Ensure that the nuts have a minimum locking (run-down) torque of 6.5 lbf in. (0,73 N.m). Torque-tighten the nuts to 210 lbf in. (24 N.m).
  - (r) Check the turbine rotor for swash (Ref.para.8).
  - (s) Recheck initial dynamic unbalance (Ref.para.9). If the unbalance check is satisfactory carefully vibro-etch a datum mark on the hub in line with that on the turbine rotor and labyrinth assembly. Render the original datum mark on the hub illegible.
- (11) If the initial unbalance remains outside of the acceptance limits after turning the turbine 180 deg relative to the hub, it will be necessary to recheck the static unbalance of the turbine rotor assembly.
- (a) Transfer the turbine rotor assembly from the balancing machine to the adapter on the assembly stand (Tool 873) and remove No.25 and 26 labyrinth assembly (Ref.para.B.(5)(a) to (n)).
  - (b) Transfer the turbine rotor to the mandrel (Tool 1132) and mobile stand (Tool 1111) in preparation for static unbalance check.
    - (i) Ensure that the mandrel is correctly secured to the mobile stand. Secure the lifting ring (Tool 1121) to the end of the mandrel and swivel the mandrel to the vertical position. Ensure thorough cleanliness of the Hirth serrations. Remove the nuts from the mandrel disk.
    - (ii) Assemble the lifting fixture (Tool 998) to the turbine disk attach a crane hoist to the lifting fixture and remove the rotor assembly from the hub.

NOTE: The hub assembly can remain in the adapter.

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

(iii) Align the datum marks O on the turbine disk and mandrel and carefully lower the turbine on to the mandrel. Secure the turbine rotor with the mandrel nuts.

(iv) Attach a crane hoist to the lifting fixture assembled to the end of the mandrel.

(v) Remove the pin securing the angled clamp support tube on the mobile stand and carefully swivel the support tube forward.

CAUTION: TURBINE BLADES MUST NOT CONTACT CLAMP TUBE. DAMAGE TO BLADES COULD RESULT.

(vi) Swivel the mandrel into the horizontal position on the stand and secure the clamps and angled support tube. Remove the lifting ring from the end of the mandrel and convey the assembly to the appropriate area for static unbalance checks.

(c) Recheck static unbalance of the LP turbine rotor (Ref.para.6).

(12) Assemble the turbine rotor to the hub assembly (Ref.para.7.C.).

NOTE: If the hub assembly has been removed from the adapter, reassemble it to the adapter and secure with the splined clamp and retaining nut (Ref.Fig.509). No.25 labyrinth ring and No.26 labyrinth housing have not been disassembled.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

shecma

- (13) Check the turbine rotor for swash (Ref.para.8).
- (14) On completion of satisfactory swash check, transfer the turbine rotor assembly to the dynamic balancing machine and repeat the dynamic balancing procedure.
- (15) Assemble weights to position FT and RT (Ref.Fig.514).
  - (a) Select weights of previously calculated value from the range (1-30 to 65) in preparation for assembly to position FT.
  - (b) Select weights of previously calculated value from the range (1-160 to 169) in preparation for assembly to position RT.
  - (c) Remove the nuts and washers from the known angle of error at FT and RT. Apply lubricant 'C' to the bolt threads.
  - (d) Assemble weights to the appropriate positions. Do not assemble flat washers to the weight positions. Ensure that the securing nuts (1-20 and 1-150) have a minimum locking (run-down) torque of 6.5 lbf in. (0,73 N.m). Torque-tighten the nuts to 210 lbf in. (24 N.m).
  - (e) Recheck dynamic unbalance of turbine assembly.
- (16) On completion of satisfactory dynamic unbalance check, transfer the turbine assembly to the balancing mandrel mobile stand.

OLYMPUS 593

MK.610-14-28

OVERHAUL

## 10. Removal of Slave Bearing

### A. Remove Retaining Nuts.

- (1) Assemble the immobiliser (Tool 1243) to the end of the mandrel, ensuring that it locates fully in position.
- (2) Place the wrench spanner (Tool 1580) over the immobiliser and engage it with the LP turbine retaining nut.
- (3) Attach a crane hoist to the torque multiplier (Tool 1647) and engage the multiplier with the splines on the immobiliser and wrench spanner.

WARNING: CRANE HOIST MUST SUPPORT TORQUE MULTIPLIER DURING DE-TORQUEING PROCEDURE.

- (4) In conjunction with the torque multiplier, use the torque wrench (Tool 1658) to slacken the retaining nut.
- (5) Remove the equipment. Unscrew and remove the retaining nut and cupwasher.
- (6) Remove the bearing track retaining nut with the hand spanner (Tool 1596).
- (7) Attach a crane hoist to the lifting fixture (Tool 1141) and securely attach the lifting fixture to the disk section of the rotor assembly.

### B. Remove Slave Bearing.

- (1) Assemble the mechanical puller (Tool 1137) to the slave bearing and mandrel.
  - (a) Unscrew the puller handle as far as possible. Place the tool on the end of the mandrel and engage the claws with the slave bearing. Evenly tighten the knurled nuts to hold the claws in position.

PRINTED IN ENGLAND

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (b) Carefully tighten the puller handle to remove the slave bearing.

#### 11. LP Turbine Main Securing Bolts Stretch Procedure

##### A. Transfer Rotor From Mandrel to Stand Assembly (Tool 873).

- (1) Ensure that the lifting fixture (Tool 1141) attached to the turbine disk is secure.
- (2) Position the adapter horizontally in readiness to accept the turbine rotor. Remove the splined retaining disk from the adapter.
- (3) Carefully withdraw the turbine rotor from the mandrel and slide it hub first on to the adapter.
- (4) Install the splined clamp to hold the turbine rotor in position. Secure the clamp with the retaining nut.
- (5) Remove the lifting equipment from the turbine disk. Adjust the adapter to position the turbine rotor horizontally.

##### B. Stretch Turbine Bolts (Ref.Fig.516).

- (1) Slacken the locknuts on the main securing bolts.
- (2) Identify the securing bolt positions 1 to 10, then torque-tighten the nuts to 10 lbf ft (13,6 N.m) using the wrench (Tool 1658) in the following sequence, 1, 6, 4, 9, 2, 7, 5, 10, 3 and 8.
- (3) Commence the stretching procedure at No.1 position as follows:
  - (a) Place the spanner (Tool 1492) on the nut.
  - (b) Place dial indicator base block (Tool 34) near the spanner. Set the dial indicator at 0 with the stylus in contact with end of the bolt.

OVERHAUL

- (c) Carefully tighten the nut until the dial indicator shows a bolt stretch reading of 0.004 in. (0,10 mm).
- (4) Complying with the torque-tightening sequence, repeat the described stretching procedure and stretch each bolt.
- (5) Repeat the stretching procedure to the value of a further 0.004 in. (0,10 mm) at all positions.
- (6) Finally stretch the bolts in sequence a further 0.002 in. (0,05 mm) achieving a total stretch of 0.010 in. (0,25 mm) for each bolt. Maximum permissible total bolt stretch = 0.012 in. (0,30 mm).

## 12. Install LP Turbine Bearing Inner Track

### A. Prepare Turbine Rotor.

- (1) Turn the assembly stand until the turbine rotor is in the vertical position.
- (2) Attach a crane hoist to the lifting fixture (Tool 1141) and securely attach the lifting fixture to the disk section of the rotor assembly.
- (3) Unscrew and remove the retaining nut securing the splined retaining clamp located inside the rotor hub. Ensure that the crane hoist and the lifting fixture support the turbine rotor. Carefully withdraw the retaining clamp.
- (4) Carefully remove the turbine rotor from the adapter. Turn the rotor in order to assemble the labyrinth to the opposite end of the adapter.
- (5) Remove the retaining plate from the opposite end of the adapter. Assemble the turbine rotor to the adapter and secure it with the retaining plate and nut.
- (6) Turn the assembly stand to position the turbine rotor horizontally in readiness for the installation of the bearing track.

B. Install Bearing Track (Ref.Fig.517).

- (1) Ensure thorough cleanliness of the hub and inner track. Heat the bearing track to 100 deg C.
- (2) Position the heated bearing track on the turbine hub so that the edge carrying the identification markings is visible. Ensure that the track locates fully in position.
- (3) When the bearing track has cooled, remove the retaining plate securing the rotor to the adapter. Assemble the lifting fixture (Tool 1142) to the turbine hub and attach a crane hoist to the fixture in readiness for removal of the assembly for dimensional checks.

13. Turbine Rotor Dimensional Checks and Final Inspection

A. Prepare for Dimensional Checks (Ref.Fig.518).

- (1) Place the checking fixture (Tool 1156) on a suitable measuring surface in readiness to accept the turbine rotor assembly.
- (2) Remove the turbine assembly from the stand adapter and carefully lower the assembly on to the checking fixture.

B. Dimensional Check Procedure (Ref.Fig.518).

- (1) Measure the distance from the base of the checking fixture to the top surface of the LP turbine disk. Record as dimension 'A'.
- (2) Deduct dimension A from the checking fixture set dimension B. Set dimension = 7.250 in. (184,15 mm). Record the result as dimension D on the sub-assembly record.
- (3) Measure the thickness of the LP turbine disk dimension C. Record the result on the sub-assembly record.

TN48463

OLYMPUS 593

MK.610-14-28  
OVERHAUL

C. Final Inspection.

- (1) Thoroughly inspect the sub-assembly for cleanliness and freedom from damage.
- (2) Remove the turbine from the checking fixture. Assemble the protectors (Tool 1134) and (Tool 1138) to the labyrinths.
- (3) Place the turbine on support (Tool 1012) and remove the lifting fixture from the hub.
- (4) Ensure that the module identification plate is marked with the correct details.
- (5) Secure the module plate to the turbine and despatch the turbine (on the pallet) to engine assembly (72-00-00 Assembly).

LP TURBINE BEARING SUPPORT - SUB-ASSEMBLY

1. General

- A. Prior to commencing the sub-assembly, refer to 72-09-00 Assembly for general information.
- B. During the sub-assembly procedure, reference will be made to the Illustrated Parts Catalogue (I.P.C.) to identify those items where the nomenclature does not positively identify them, due to duplication of the titles e.g. nuts, bolts, washers, bearings, gears, housings, tubes etc. When the item is a part of the breakdown of the text concerned, the item will be identified e.g. bolt (1-10), the 1 referring to the I.P.C. Fig.No., and the 10 referring to the Item No. Where items from a different breakdown are introduced, then the breakdown number will be quoted in addition e.g. bolt (72-32-00/1-10), unless otherwise stated.
- C. Throughout the text special tools are quoted by their Ref. No. e.g. (Tool 1234). For a complete list of tooling required for the assembly, and for the Manufacturers Part No., refer to Special Tools, Fixtures and Equipment Table 1002.
- D. This chapter deals with the assembly of the turbine bearing support into three small assemblies, the bearing housing, the rear cover and the (end) cover. These three assemblies and their loose items are passed to the Turbine Exhaust Diffuser (72-53-00 Assembly) for inclusion in its build. The three assemblies could be assembled together with the bearing and retaining ring, if required, but would require disassembling prior to assembly to the Turbine Exhaust Diffuser.
- E. The bearing support assembly will have its angular positions defined in this text as the exhaust diffuser vane number to which it will be assembled. There are 10 vanes, numbered 1-10 in a clockwise direction as viewed from the rear, with No.1 being the first vane from the vertical top position.

## 2. Assemble Items to the Bearing Housing

### A. Assemble the Outer Labyrinth Housing to the Bearing Housing (Ref.Fig.501).

NOTE: If the bearing housing is a new item, examine the circumference of its front (larger diameter) flange for the word TØP. If the word is not present, examine the rear (smaller diameter) flange for the locating pin position, between two of the attachment bolt holes, then in line with the pin or pin hole, etch TØP on the circumference of the front flange.

- (1) Place the bearing housing in an oven at (approx.) 150 deg C for (approx.) 30 min. If the locating pin (2-150) is not assembled to the bearing housing rear (smaller diameter) flange, place the pin in Cardice for (approx.) 20 min or liquid nitrogen for (approx.) 2 to 3 min, its removal time to coincide with the removal time of the bearing housing.

NOTE: Bearing housings to SB.72-40 Part 1 standard will have this dowel swaged in position.

- (2) Using protective gloves, remove the bearing housing from the oven. If the locating pin is not assembled to the rear flange, place the housing on a clean flat surface with its rear flange uppermost, then assemble the pin to its recessed hole (in line with the TØP position marked on the front flange circumference). With the pin assembled, offer the bearing housing to the locating fixture (Tool 412) (Ref.Fig.501) with its front flange uppermost and assembled over the guide pins of the fixture.
- (3) Examine the outer labyrinth housing outside circumference in line with one of the eight bolt-holes for the word TØP. Align the positions marked TØP on the outer labyrinth housing and bearing housing, then offer the labyrinth housing over the fixture guide pins, and locate the labyrinth outer spigot into the bearing housing. Ensure the labyrinth abuts the bearing housing at the attachment bolt-hole position.

NOTE: If the word TØP cannot be found, the outer labyrinth housing may be assembled in any one of its eight rotational positions.

OVERHAUL

(4) Lubricate the eight bolts (2-170) with lubricant 'A', then offer six of the bolts (from the top) through the labyrinth and bearing housings and screw nuts (2-160) onto the bolts. Check that the run-down torque is not less than 3.5 lbf in. (0,4 N.m), then torque-tighten the nuts to 100 lbf in. (11,5 N.m). Remove the housing assembly from the fixture, then assemble the remaining two nuts and bolts. Check that the run-down torque is not less than 3.5 lbf in. (0,4 N.m), then torque-tighten the nuts to 100 lbf in. (11,5 N.m).

(5) Screw the protector (Tool 971) into the bearing housing oil feed boss at the No.6 vane position (bottom left-hand side, viewed from rear).

**B. Assemble the Sockets and Seal Housings to the Cover and Sleeve Assemblies (Ref.Fig.502).**

(1) Locate the front face (larger diameter) of the sleeve assembly (2-130) on the positioning fixture (Tool 446), then locate the front face (larger diameter) of the cover assembly (2-110) on the positioning fixture. Align the three openings in the sleeve with three of the openings in the cover.

(2) Place the positioning fixture with the sleeve and cover in a pre heated oven at (approx.) 150 deg C for (approx.) 30 min, and the air feed socket (2-20), two seal housings (2-100) and two vent sockets (2-40) in a container with Cardice for (approx.) 30 min, or liquid nitrogen for (approx.) 2 to 3 min. The removal time of the housings and sockets to coincide with the removal time of the sleeve and cover.

**NOTE:** The positioning fixture (Tool 446) is heated to maintain the temperature of the sleeve and cover for as long as possible.

(3) Using protective gloves, remove the positioning fixture/sleeve/cover from the oven, then remove the air feed socket from the Cardice or nitrogen container and slide it into the cover and sleeve at the No.2 vane position. Align the bolt holes in the socket with the captive nuts in the cover, then (temporarily) secure the socket by screwing two bolts (2-10) into the captive nuts.

- (4) Using protective gloves, remove the two seal housings from the Cardice or nitrogen container and slide them into the cover and sleeve at the No.5 and 6 vane positions. Align the bolt holes in the housings with the captive nuts in the cover, then (temporarily) secure each housing by screwing two bolts (2-80) into the captive nuts.
  - (5) Using protective gloves, remove the two vent sockets from the Cardice or nitrogen container and slide them into the cover at the No.4 and 7 vane positions. Align the bolt holes in the sockets with the captive nuts in the covers, then (temporarily) secure each socket by screwing two bolts (2-30) into the captive nuts.
- C. Assemble the Cover and Sleeve Assembly to the Bearing Housing (Ref.Fig.503).
- (1) Place the positioning fixture/sleeve/cover assembly into a pre-heated oven at (approx.) 150 deg C for (approx.) 30 min.
  - (2) With the labyrinth facing downwards locate the bearing housing on the four pillars of the support plate (Tool 1256). Remove the protector (Tool 971) from the bearing housing feed boss at No.6 vane.
  - (3) Assemble the 27 D-headed bolts (1-180) into the rear (top) flange of the bearing housing.
    - (a) Align the flat on the head of each bolt with the step on the housing.
    - (b) Push each bolt upwards so that the flat on the head passes the step.
    - (c) Rotate the bolt to trap the head between the step and the flange, ensuring that the flat is flush with the flange outer diameter.
  - (4) Using protective gloves, remove the fixture/sleeve/cover from the oven. Remove the sleeve/cover assembly from the fixture and locate it over the bearing housing assembly, aligning the seal locations (at No.5 and 6 vane position) of the two assemblies. Slide the sleeve/cover assembly over the housing until the rear of the cover abuts the rear flange of the housing (Ref.Fig.503). Fully align the items by inserting

OVERHAUL

the two locating pins (Tool 445) through the two seal housings and screwing them into the bearing housing. The sleeve/cover assembly is correctly positioned on the bearing housing only if the pins can be easily assembled and removed.

NOTE: If the sleeve/cover assembly will not slide over the bearing housing rear flange, check that the flats on the 27 rear cover bolts (1-180) are flush with the flange outer diameter.

D. Determine the Correct Thickness Bearing Retaining Ring (Ref.Fig.504).

NOTE: To achieve the correct fit for the bearing at its running temperature, a clearance between 0.0005 and 0.0015 in. (0,013 and 0,038 mm) must exist between the rear face of the bearing outer race and its retaining ring. On engines to pre SB.72-17 standard only, this clearance must be checked by the following procedure.

- (1) If the roller bearing (2-140) is a new item, remove the protective wrapping and grease (Ref.72-09-00, Assembly). If the roller bearing is the original item, assemble the cage and rollers to the outer race.

NOTE: The procedure should be carried out in an approved 'clean' room.

- (a) Position the cage inside the inner race, then press the rollers by hand into the cage.
  - (b) Ensure that the cage and rollers rotate freely. Apply temporary protection if required (Ref. 72-09-00, Inspection/Check, para.4).
- (2) With the bearing housing resting on the support fixture, offer the bearing outer race/rollers (2-140) into the bearing housing locating the bearing dogs into the slots in the housing.
  - (3) Measure the depth from the inner abutment face of the bearing housing to the face of the bearing outer race, dimension 'A'.
  - (4) Measure the length of the spigot of the retaining ring, dimension 'B'.

OVERHAUL

- (5) Dimension 'A' must exceed dimension 'B' by between 0.0005 in. and 0.0015 in. (0,013 and 0,038 mm). If the difference is greater than 0.0015 in. a new retaining ring must be used. If the difference is less than 0.0005 in. finish turn the front face of the ring (face X) to achieve the required dimension. Re-machine the chamfer then subject the retaining ring to fluorescent dye penetrant inspection (Ref. 72-52-03 Inspection/Check).
- (6) On completion of the check, remove the bearing outer race/rollers from the bearing housing and place the bearing in its container.

E. Assemble Locking Plates to the Vent and Air Feed Sockets (Ref.Fig.505).

- (1) Unscrew and remove the bolts securing the air feed socket to the cover assembly at No.2 vane, then apply lubricant 'C' to the bolts. Position a locking plate (72-53-00/1-120) on the air feed socket so that the plate extends rearwards (upwards), then secure the plate to the socket with the two bolts (2-10) just removed. With the plate pulled rearwards, torque-tighten the bolts to 100 lbf in. (11,5 N.m).
- (2) Unscrew and remove the bolts securing the vent socket to the cover assembly at No.4 vane, and apply lubricant 'C' to the bolts. Position a locking plate (72-53-00/1-290) on the vent socket so that the plate extends rearwards (upwards), then secure the plate to the socket with the two bolts (2-30) just removed. With the plate pulled rearwards, torque-tighten the bolts to 100 lbf in. (11,5 N.m).
- (3) Unscrew and remove the bolts securing the vent socket to the cover assembly at No.7 vane and apply lubricant 'C' to the bolts. Position a locking plate (72-53-00/2-190) on the vent socket so that the plate extends rearwards (upwards), then secure the plate to the socket with the two bolts (2-30) just removed. With the plate pulled rearwards, torque-tighten the bolts to 100 lbf in. (11,5 N.m).
- (4) Lock the two bolts securing each of the two vent sockets and the air feed socket by wire-locking each pair of bolts (Ref.Fig.505).

### 3. Assemble Items to the Rear Cover

#### A. Assemble the Rear Cover to the Holding Fixture.

NOTE: During the assembly of items to the rear cover, the following text details the use of a flat surface and the bearing housing. If preferred, the holding fixture (Tool 847) may be used for any or all of the assembly, and mention in the text of the bearing housing and flat surface ignored.

- (1) If the holding fixture (Tool 847) is to be used, bolt the fixture to a Hydraclamp so that the clamps are uppermost. With the clamps drawn outwards, locate the front end of the rear cover in the fixture, then position the clamps over the rear cover flange and lock the clamps by tightening the securing nuts.

#### B. Assemble the Pin and Oil Tube to the Rear Cover.

NOTE: The oil tube assembly (1-120) must be to the same SB. standard as the bearing housing (2-190) defined in SB.72-40.

NOTE: Unless the oil tube assembly (1-120) incorporates SB.72-52, some setting may be required when assembling the rear cover (1-160) to the bearing housing (Ref.para.C.(1)) and the (end) cover (1-70) to the rear cover (Ref.para.4.A.(2)).

- (1) If the locating pin (1-150) is not assembled to the (smaller diameter) rear flange of the rear cover (1-160), place the locating pin in a container with Cardice for (approx.) 20 min or liquid nitrogen for (approx.) 2 to 3 min. Rest the front face of the rear cover on a flat clean surface, then remove the pin from the Cardice or nitrogen container, and assemble it to its stepped hole in the rear (top) flange between two of the bolt holes.
- (2) Invert the rear cover so that its front end is uppermost, then assemble to the bracket on the inside of the cover, the oil tube assembly (1-120) so that its jet end extends upwards above the cover (Ref.Fig.506). Apply lubricant 'A' to the two bolts (1-140), then assemble the bolts to the oil tube and bracket and screw nuts (1-130) onto the bolts. Check that the locking (run-down) torque is a minimum of 3.5 lbf in. (0,4 N.m), then torque-tighten the nuts to 100 lbf in. (11,5 N.m).

OVERHAUL

C. Assemble the Insulation Blankets to the Rear Cover (Ref.Fig.506).

- (1) With the bearing housing resting on the support fixture (Tool 1256), offer the front face of the rear cover to the rear face of the bearing housing, aligning the locating pin in the housing with the hole in the cover. Locate the cover over the securing bolts and pin, and by viewing into the cover, ensure that the oil tube locates in the oil hole in the bearing housing. Some resetting may be necessary if the tube assembly is pre SB.72-52 standard. Ensure the rear cover locates correctly in the cover (2-110) and abuts the bearing housing, if necessary by using a light alloy drift and hammer.
- (2) Locate the insulation blanket (1-50) around the right-hand side of the rear cover, and the insulation blanket (1-40) around the left-hand side, assembling them around the oil scavenge pipe and sump, and locating the two brackets on each blanket over the bearing housing bolts.
- (3) Ensure that the blankets overlap one another correctly, then position the (rear) insulation blanket (1-10) on top of the other blankets aligning the securing holes in the brackets, and temporarily secure together with four nuts (1-20) and bolts (1-30) pre SB.72-20 standard or by wiring SB.72-20 standard.
- (4) Temporarily secure the blanket brackets to the bearing housing bolts with nuts (1-170) to prevent movement, then fasten the two (side) blankets together by wire-locking at the seven eyelet positions pre SB.72-20 standard or six positions SB.72-20 standard.
- (5) With the (side) blankets wire-locked together, release and remove the (end) blanket.

D. Assemble the LP Shaft Signal Actuating System to the Rear Cover (Ref.Fig.507).

NOTE: The figure and item numbers following the names of parts of the LP shaft and signal system relate to section 76-21-02 of the IPC.

- (1) Apply lubricant 'C' to the splines of the actuating arm (1-580) and to the nut (1-510). View the rear cover from the rear end (top) with the sump taken as being at the bottom position. Offer the actuator arm into the sump, locate a seal (1-530) in the groove on the left-hand side of the sump, then insert the actuating arm shaft (1-570) into the left-hand side of the sump and through the actuating arm, having aligned the master splines. Ensure the seal is located in its groove and the actuating arm shaft abuts it, holding it in position.
- (2) Locate a seal (1-530) in the groove on the right-hand side of the sump, then slide the retainer (1-520) over the actuating arm shaft and into the sump ensuring the seal is held in its groove. Enter the bolt (1A-540) through the shaft, from the left-hand side, and screw the castellated nut (1A-510B) onto the protruding end of the bolt having applied lubricant 'C'. Torque-tighten the nut to 180 lbf in. (20,1 N.m) and lock the nut with a split pin (1A-500). The castellated nut must be further tightened if necessary to align the next cut-out with the split pin hole. On engines embodying SB.76-2 (Part 2) with a longer bolt (1A-550) and sleeve (1A-560) used with a reworked pre SB.76-2 standard shaft, insert the sleeve into the actuating arm shaft and insert the bolt through the sleeve and the shaft, so that the head of the bolt draws up onto the outer face of the sleeve. Apply lubricant 'C', then screw the castellated nut (1A-510B) onto the bolt and torque-tighten the nut to 180 lbf in. (20,1 N.m). Lock the nut with a split pin (1A-500). The castellated nut must be further tightened if necessary to align the next cut-out with the split pin hole.
- (3) Apply lubricant 'C' to the two bracket bolts (1-170). Offer the bracket (1-190) to the left-hand side of the bracket on the bottom of the sump, so that the bracket extends downwards. Offer the two bolts into the brackets from the left-hand side, then screw nuts

1-160) onto the bolts and check that there is a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the nuts to 100 lbf in. (11,5 N.m) using a suitable tool between the two flats to facilitate the tightening of the nuts.

- (4) Assemble the adjusting washer (1-200) to the special bolt (1-490), then assemble the bolt to its bracket (1-190) with the bolt head uppermost. Screw the nut (1-180) onto the bolt but do not torque-tighten.

NOTE: The thickness of the adjusting washer is determined during engine build (Ref.71-00-01), where any adjustment to its thickness will be rectified by assembling a different thickness washer.

#### 4. Assemble Items to the (End) Cover

- A. Assemble the Oil Tube and Transfer Block to the (End) Cover (Ref.Fig.508).

- (1) Position the transfer block (1-80) on the recessed face of the (end) cover (1-70) with the feed hole projection 180° from the dowel hole in the cover, then position the oil tube on the block with the offset holes aligned. On engines to SB 72-180 standard, two bolts with nuts torqued-tightened and peened are already assembled to the end cover (1-70B) to prevent incorrect assembly of the transfer block. Apply lubricant 'A' to the three bolts (1-100), then assemble the bolts through the cover, oil transfer block and oil tube. Screw nuts (1-90) onto the bolts and check that the locking (run-down) torque is a minimum of 10 lbf in. (1,1 N.m), then torque-tighten the nuts to 100 lbf in. (11,3 N.m).
- (2) Trial assemble the (end) cover to the rear cover, ensuring that the oil tube slides freely over the oil tube in the rear cover, and that the pin hole locates over the locating pin in the rear cover, with the (end) cover abutting the rear cover flange. If the faces do not abut correctly, the oil tube (1-120) in the rear cover may have to be reset, or an oil tube to SB.72-52 standard used to permit the correct assembly of the (end) cover. Remove the (end) cover from the rear cover on completion of a satisfactory assembly.

## TURBINE EXHAUST DIFFUSER - SUB-ASSEMBLY

### 1. General

- A. Prior to commencing the sub-assembly, refer to 72-09-00 Assembly for general information.
- B. During the sub-assembly procedure, reference will be made to the Illustrated Parts Catalogue (I.P.C.) to identify those items where the nomenclature does not positively identify them, due to duplication of the titles e.g. nuts, bolts, washers, bearings, gears, housings, tubes etc. When the item is a part of the breakdown of the text concerned, the item will be identified e.g. bolt (1-10), the 1 referring to the I.P.C. Fig.No., and the 10 referring to the Item No. Where items from a different breakdown are introduced, then the breakdown number will be quoted in addition e.g. bolt (72-32-00/1-10), unless otherwise stated.
- C. Throughout the text special tools are quoted by their Ref.No. e.g. (Tool 1234). For a complete list of tooling required for the assembly, and for the Manufacturers Part No., refer to the Special Tools, Fixtures and Equipment Table 1002.
- D. Although this chapter deals with the assembly of the turbine exhaust diffuser, items from the following breakdowns are also used in the assembly.

72-52-03	LP Turbine Bearing Support
76-21-02	LP Signal Shaft System
71-32-02	Engine Heat Shields
72-54-01	Spherical Joint Flange
76-13-03	PNC Signal Pitot
77-12-03	Engine Power Pitot
75-03-02	Flanged Connection
71-73-06	Fuel Drain Assembly

The components of the LP Turbine Bearing Support are supplied as three sub-assemblies and some loose items. All other components are supplied as loose items on pallets or in containers.

- E. Throughout this text angular position is defined by relationship to the vanes, of which there are 10, five having oil or air tubes passing through them. The vanes are numbered 1 to 10 in a clockwise direction as viewed from the rear, with No.1 being the first vane from the vertical top position.

SUB-ASSEMBLY

OVERHAUL

## 2. Assemble the Turbine Exhaust Diffuser

### A. Assemble the Inner and Outer Cases to the Stand.

- (1) Ensure that the mounting plate (Tool 309) is bolted to the stand (Tool 832) and that the stand arms are extended upwards. Attach a hoist to the lifting ring of the jacking fixture (Tool 299) (Ref.Fig.501), then position the hoist over the stand with the clamps of the jacking fixture pulled outwards. Lower the fixture onto the stand mounting plate with the fixture bridge piece at right angles to the stand arms, and located in the cutaway parts of the mounting plate. Push the fixture clamps in under the mounting plate, then tighten the clamp securing nuts. Disconnect the hoist from the jacking fixture. Release the stand lock, turn the mounting plate over so that the fixture is underneath, then apply the stand lock.

NOTE: As an alternative to using a hoist, the jacking fixture (Tool 299) may be left on its mobile stand (Tool 811) with the fixture lifting eye lowermost, the fixture positioned under the stand, ensuring the stand arms are extending downwards, then the fixture lifted up and clamped onto the stand (Ref.Fig.501).

- (2) Attach the lifting fixture to the inner diffuser.

NOTE: A revised standard of diffuser inner case was introduced by SB.72-8038-181 having caged bolts in place of caged nuts. This modified inner case requires a revised lifting fixture (Tool 1953) which can be used also for unmodified cases. The original lifting fixture (Tool 305) can be used only on unmodified inner cases.

- (a) Lower the lifting fixture (Tool 305) onto the rear (smaller diameter) face of the inner case to pre SB.72-8038-181 standard, and screw the captive bolts of the fixture into the caged nuts of the diffuser.
- (b) Completely slacken the seven thumbnuts on the lifting fixture (Tool 1953) and turn the seven latches so that the pins on their heads point inwards towards the word 'FREE'. Lower the fixture onto the rear (smaller diameter) face of the inner case to post or pre SB.72-8038-181 standard, so that the latches enter

OVERHAUL

the inner case. Position the fixture with the word 'TOP' between vanes No.1 and No.10, then rotate the latches to the 'LOCKED' position (i.e. with the pins outwards) and tighten the thumbnuts.

- (3) Attach a hoist to the lifting fixture ring, then raise the hoist and position the inner case over the jacking fixture support pad. Steadily lower the hoist and locate the lower flange of the inner case on the support pad spigot. Remove the hoist, then release and remove the lifting fixture. Screw the jacking fixture to its lowest position to ensure clearance when the outer case is assembled.
- (4) On inner cases to pre SB.72-8038-181 standard, use slave bolts lubricated with lubricant 'A' and ensure that the locking (run-down) torque of the caged nuts in the rear flange are not less than 3.5 lbf in. (0,4 N.m).

**CAUTION:** DO NOT ROTATE STAND AS INNER CASE IS NOT SECURED.

- (5) Remove the nuts and washers from the lifting fixture (Tool 298). With the rear face (smaller diameter) of the outer case uppermost, lower the fixture centrally on the case locating the studs in the flange bolt-holes (Ref.Fig.502). Secure the fixture with the slave nuts and washers.
- (6) Attach a hoist to the ring of the lifting fixture, then raise the hoist and position the outer case over the stand mounting plate. Ensure that the four mounting plate clamps are positioned out of the way, then rotate the outer case until the dowel hole in the front flange is aligned with the middle of one of the cutaways in the mounting plate. Lower the case on to the mounting plate, aligning the bolt-holes. Secure the outer case with the mounting plate clamps. Release and remove the lifting fixture, then remove the hoist from the fixture.
- (7) Assemble the D-head bolts in the front flange of the outer case ensuring that the appropriate bolts are in their correct location (Ref.Fig.503). No.1 bolt-hole is counter-clockwise of the dowel hole when viewed from the rear.

**NOTE:** These bolts will be trapped by the containment shield and used on final engine assembly.

OVERHAUL

B. Assemble the Containment Shield to the Outer Case.

- (1) Examine the containment shield and ensure that the eight locating grooved pins are fitted to the centre holes in each of the eight attachment bracket positions (Ref.Fig.504). If the locating pins (3-20) are not assembled, place the pins in a container with Cardice for (approx.) 30 min. or liquid nitrogen for (approx.) 2 to 3 min. Remove the pins from the Cardice or nitrogen container, then assemble them to the containment shield.
- (2) Screw the lifting handles (Tool 1966) into four equally spaced threaded holes in the containment shield, then lower the containment shield over the outer case and rest the flared end on the boltheads assembled to the case front flange. Turn the shield to position it relative to the outer case with the two small adjacent scallops in the shield aligned with No.7 vane (Ref.Fig.504), then remove the lifting handles.
- (3) Assemble a slave bracket (Tool 297) to every other attachment bracket position, attaching each bracket to a locating pin, with the bracket extending to the flared end of the shield. At the same time insert the three cut-outs under the boltheads in the appropriate position on the front flange (Ref. Table 501). Secure each slave bracket to the containment shield with its captive bolts.

OVERHAUL

- (1) Examine the rear flange of the outer case and ensure that the shouldered pin (4-150) is assembled, then examine the outside of the case at No.6 vane position and ensure that the two shouldered pins (76-21-02/1-110) for the signal system pulley shroud are assembled. If the pins are not fitted, place them in a container with Cardice for (approx.) 30 min. or liquid nitrogen for (approx.) two to three min. Remove the shouldered pin (4-150) from the Cardice or nitrogen and assemble it to its hole in between two of the bolt-holes at the normal top position of the case rear flange. Remove the two shouldered pins (76-21-02/1-110) from the Cardice or liquid nitrogen and assemble them to the pin holes from the outside of the case at the No.6 vane position.
- (2) Assemble the eccentric bolts in their respective vane positions (Ref.Table 502), by inserting the bolts into their holes from inside the case and locating their heads in the eccentric bores in the case. Secure the bolts by assembling retaining rings to the grooves in the bolts from the outside of the case.
